| Combined | | 95 | 41 | 78 | 24 | 238 |

TA: tubular adenoma; TVA: tubulovillous/villous adenoma; HP: hyperplastic polyp; SSA:

sessile serrated adenoma.

eTable 2. Performance of Local Pathologists and Our Deep Neural Network Stratified by Level of Agreement of the Five DHMC Pathologists for Ground-Truth Labels for the Multi-Institutional External Validation Set of 238 Slides

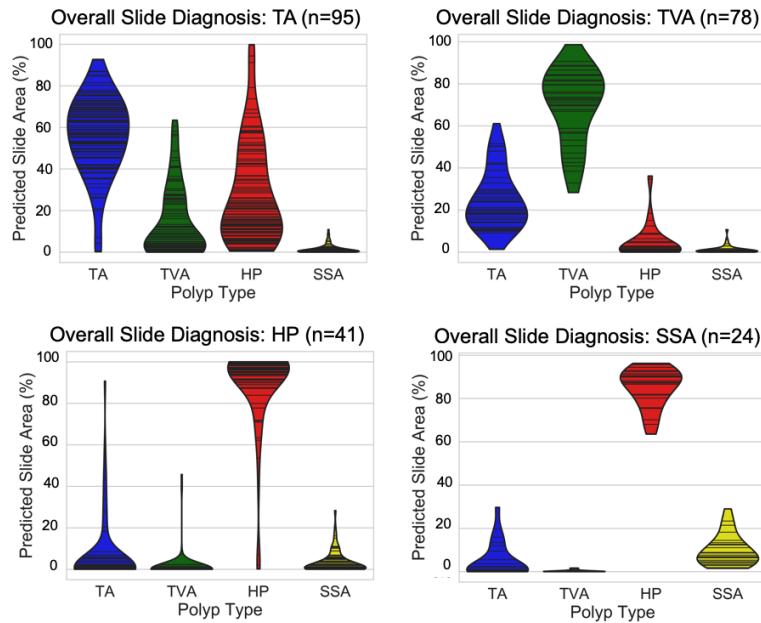

| | Number of Slides | | | | | Local Pathologists | | | Deep Neural Network | | |
|--------------------|------------------|-----|----|----|-------|--------------------|----------|------|---------------------|----------|------|
| Level of Agreement | TA | TVA | HP | SS | Total | Acc | Sens (%) | Spec | Acc | Sens (%) | Spec |
| 3/5 Pathologists | 19 | 14 | 9 | 4 | 46 | 79.3 | 64.2 | 86.0 | 80.4 | 65.6 | 87.0 |
| 4/5 Pathologists | 19 | 10 | 19 | 7 | 55 | 83.6 | 71.0 | 89.4 | 82.7 | 72.7 | 89.2 |
| 5/5 Pathologists | 57 | 17 | 49 | 14 | 137 | 90.5 | 85.5 | 94.3 | 91.2 | 83.2 | 94.1 |

Both local pathologists and the deep neural network performed better on slides that more DHMC pathologists agreed on. Acc: unweighted average class accuracy; Sens: unweighted average class sensitivity; Spec: unweighted average class specificity. TA: tubular adenoma; TVA: tubulovillous/villous adenoma; HP: hyperplastic polyp; SSA: sessile serrated adenoma.

eFigure 1. Number of Patches per Digitized Slide and Slide Size (in Pixels) for **(A)** the Internal Test Set and **(B)** the Multi-institutional External Test Set

Patches are fixed-size areas of tissue obtained by sliding a window over the entire image. Size of digitized slides reflects the area of the tissue after removing the background.

eFigure 2. Violin Plots Showing Predicted Percentage Areas (Based on Number of Patches) for Each Polyp Type on Whole-Slide Images, Depicting the Distribution of Predicted Patches by the Model for Corresponding Ground Truth Labels

TA: tubular adenoma; TVA: tubulovillous/villous adenoma; HP: hyperplastic polyp; SSA: sessile serrated adenoma. For whole slides that were diagnosed as TA and TVA, our model detected significant areas of TA and TVA, reflecting the morphological similarity of the two polyp types. Our model also detected large areas of HP in whole slides diagnosed as TA, which is expected since all polypoid lesions in TAs are exposed to elevated mechanical forces and therefore show hyperplastic features at their peripheries. While the model detected mostly HP areas in whole slides diagnosed as hyperplastic polyps, it did find some small areas of SSAs, possibly because larger HPs with deep, dilated crypts and serrated epithelium can appear similar to SSAs. Finally, for whole slides that were diagnosed as SSAs, it makes sense that HPs comprised the largest area, since all SSAs have significant morphological overlap with

hyperplastic polyps and may contain only a few classic, broad-based, dilated crypts with heavy serration.
