Received 12 November 2013; accepted 15 January 2014

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ;  $R$  factor = 0.054;  $wR$  factor = 0.128; data-to-parameter ratio = 19.4.

In the title compound,  $\text{C}_{13}\text{H}_9\text{BrClNO}$ , the dihedral angle between the substituted benzene rings is  $44.25(11)^\circ$ . There are strong intramolecular O—H···N hydrogen bonds, which generate  $S(6)$  rings, and also intermolecular Cl···Cl [3.431 (3)  $\text{\AA}$ ] and Br···Br [3.846 (1)  $\text{\AA}$ ] contacts. The crystal packing a C—H···O and C—H··· $\pi$  interactions.

## 2-[(*E*)-(4-Bromophenyl)iminomethyl]-4-chlorophenol

Xiao-Li Gao, Si-Si Feng, Cai-Xia Yuan and Miao-Li Zhu

### 1. Comment

Schiff bases are condensed by primary amines and carbonyl compounds, containing strong electronegative with atoms O and N, thus it is easy to coordinate with the metal ions to form stable complexes (Akmal *et al.*, 2007; Rehmana *et al.*, 2008). It is reported that metal complexes of Schiff base derivatives have a variety of important biological activities, such as anti-bacterial, anti-cancer, anti-tumor, hypoglycemic and so on (Vanco *et al.*, 2008; Li *et al.*, 2007; Ritter *et al.*, 2009). Our reports indicated that copper and vanadium complexes of Schiff bases are potential inhibitors over protein tyrosine phosphatases (Li *et al.*, 2011; Lu *et al.*, 2011; Ma *et al.*, 2011; Yuan *et al.*, 2009, 2010).

We report here the synthesis and characterization a potentially bidentate Schiff base derivative, (I), and prepared from the condensation reaction of an equimolar proportion of 5-chloro-salicylaldehyde and 4-bromo-aniline in absolute ethanol. The molecular structure is depicted in Fig. 1. X-ray structural analysis confirmed that in the title compound, (I), the dihedral angle between the substituted benzene rings is nearly 44.25 (11) $^{\circ}$ , similar to the compound 4-bromo-2-[(*E*)-(4-chlorophenyl)iminomethyl]phenol (Ardakani *et al.*, 2011). In the crystal, there are strong intramolecular O—H···N hydrogen bonds with a distance of 2.593 (5) Å between donor and acceptor, which generate S(6) ring and intermolecular Cl1···Cl1<sup>i</sup> [3.430 (2) Å, i -*x*, -*y*, -*z*] as well as Br1···Br1<sup>ii</sup> [3.846 (1) Å, ii 2 - *x*, -*y*, -*z*] contacts. The crystal packing is further stabilized by intermolecular C—H···O and C—H···π interactions (Table 1).

### 2. Experimental

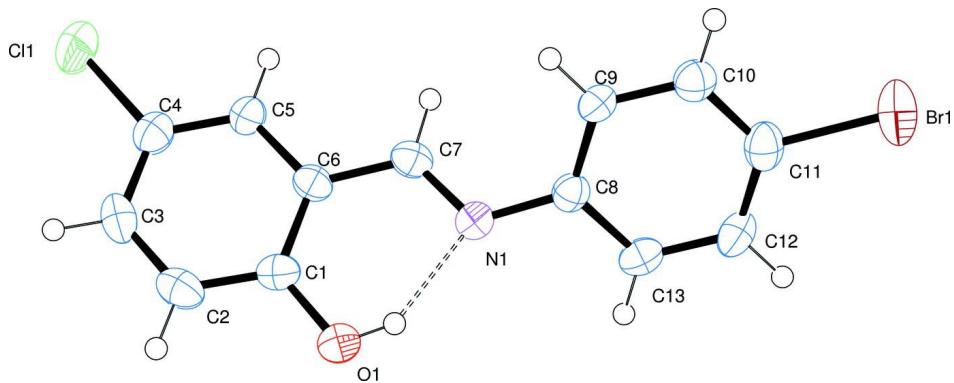

A 0.1566 g (1.0 mmol) 5-chloro-salicylaldehyde in 15 ml of absolute ethanol was heated until thoroughly dissolved and 0.1720 g (1.0 mmol) of 4-bromo-aniline in 5 ml of absolute ethanol was added dropwise with a constant stirring. The reaction mixture was heated under refluxing for 3 h. After cooling slowly, the orange powder was separated out. Orange-red crystal was obtained from filter after two weeks.

### 3. Refinement

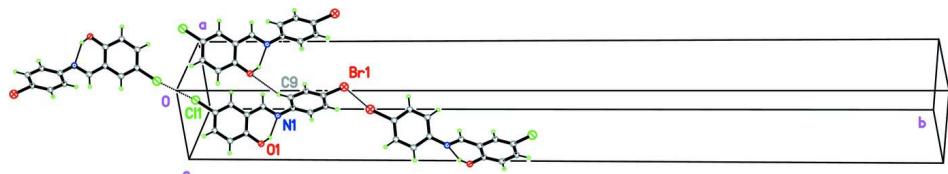

H atoms attached to C and O of (I) were placed in geometrically idealized positions with  $Csp^2$ —H = 0.93 Å and O—H = 0.84 Å and constrained to refine with  $U_{iso}(\text{H}) = 1.2U_{eq}(\text{C})$  and  $U_{iso}(\text{H}) = 1.5U_{eq}(\text{O})$ .

### Computing details

Data collection: SMART (Bruker, 2000); cell refinement: SAINT (Bruker, 2000); data reduction: SAINT (Bruker, 2000); program(s) used to solve structure: SHELXS97 (Sheldrick, 2008); program(s) used to refine structure: SHELXL97 (Sheldrick, 2008); molecular graphics: ORTEP-3 for Windows (Farrugia, 2012); software used to prepare material for publication: publCIF (Westrip, 2010).

**Figure 1**

A view of the structure of (I), with displacement ellipsoids drawn at the 30% probability level. Dashed line indicates hydrogen-bonding interaction.

**Figure 2**

The packing diagram of the title compound, showing the intermolecular O—H···N and intermolecular Cl···Cl, Br···Br and C—H···O interactions (dotted lines).

where  $P = (F_o^2 + 2F_c^2)/3$

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.42 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.95 \text{ e } \text{\AA}^{-3}$$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg1 and Cg2 are the centroids of the C1—C6 and C8—C13 benzene rings, respectively.

D—H···A	D—H	H···A	D···A	D—H···A
O1—H1···N1	0.82	1.87	2.593 (4)	147
C2—H2···Cg1 <sup>i</sup>	0.93	2.82	3.489 (5)	129
C5—H5···Cg1 <sup>ii</sup>	0.93	2.85	3.513 (5)	129
C10—H10···Cg2 <sup>iii</sup>	0.93	2.75	3.460 (5)	133
C13—H13···Cg2 <sup>iv</sup>	0.93	2.78	3.473 (5)	132

Symmetry codes: (i)  $-x+1/2, y, z-1/2$ ; (ii)  $-x+3/2, y, z-3/2$ ; (iii)  $-x+1/2, y, z-3/2$ ; (iv)  $-x+3/2, y, z-1/2$ .
