*Correspondence e-mail: saowanit.sa@psu.ac.th

The reaction of cuprous bromide with a mixture of 1,1-bis(diphenylphosphanyl)methane (dppm: $C_{25}H_{22}P_2$) and *N*-allylthiourea (ATU: $C_4H_8N_2S$) in acetonitrile yielded the title solvated dinuclear complex, $[Cu_2Br_2(C_4H_8N_2S)(C_{25}H_{22}P_2)_2] \cdot 2C_2H_3N$ or $[Cu_2Br_2(ATU)(dppm)_2] \cdot 2CH_3CN$. Both Cu⁺ ions adopt distorted tetrahedral geometries, being coordinated by one terminal Br atom, one μ^2 -S atom of the bridging ATU ligand and two P atoms of the bridging dppm ligands. Within the complex, intramolecular C—H···S, C—H···π, N—H···Br and π—π stacking interactions are observed. In the crystal, the components are linked by N—H···Br and C—H···N hydrogen bonds and weak π—π stacking interactions, generating chains propagating in the [100] direction.

1. Chemical context

Copper(I) complexes with mixed ligands containing diphosphine are of interest because of their attractive coordination chemistry and several potential applications resulting from their photophysical properties (Yam *et al.*, 1999; Jin *et al.*, 2009; Zhang *et al.*, 2011, 2014; Tsiaaggali *et al.*, 2013), antibacterial activity and their interaction ability with native calf thymus DNA (CT-DNA) (Tsiaaggali *et al.*, 2013). One of the diphosphine ligands, 1,1-bis(diphenylphosphino)methane

(dppm: $C_{25}H_{22}P_2$) is a bridging bidentate ligand which is effective in forming various structures with many types of

OPEN ACCESS

additional ligands, leading to copper(I) complexes as mono-nuclear, dinuclear, trinuclear and tetranuclear models, depending on the nature of the mixed-ligand partners and the stoichiometric ratio between the reactants and experimental conditions (Ruina *et al.*, 1997; Pérez-Lourido *et al.*, 1998; Dennehy *et al.*, 2009; Zhang *et al.*, 2011). *N*-allylthiourea (ATU: $C_4H_8N_2S$) is a substituted thiourea ligand, which contains sulfur donor atoms that can bind to a copper(I) ion *via* a variety of bonding modes (Filinchuk *et al.*, 1996, 2001; Olijnyk *et al.*, 2003). A family of allylthiourea–metal complexes has been studied for their potential photonic applications and non-linear optical (NLO) efficiencies (Perumal & Babu, 2008, 2012). In this paper, we report the synthesis and structure of a mixed-ligand copper(I) complex with dppm and ATU ligands.

2. Structural commentary

The title complex $[Cu_2Br_2(ATU)(dppm)_2] \cdot 2CH_3CN$, (I), is shown in Fig. 1. The discrete neutral dinuclear complex contains an asymmetric triply bridged dicopper(I) core forming two six-membered rings in a chair conformation, $Cu1-S1-Cu2-P1-C13-P2$ and $Cu1-S1-Cu2-P3-C38-P4$, sharing the $Cu1-S1-Cu2$ part. Each Cu^I atom is coordinated by P atoms from the different dppm ligands, one μ^2 -S bridging atom of ATU and the bromide ion as a terminal ligand, forming a distorted tetrahedral environment, as illustrated by the range of angles around the Cu atoms [100.87 (2)–116.49 (3) $^\circ$ for Cu1 and 97.45 (3)–119.31 (3) $^\circ$ for Cu2]. Both Cu^I atoms share a tetrahedral corner *via* an S-atom bridge.

The Cu \cdots Cu distance in (I) is 3.3780 (7) Å, which is similar to the Cu \cdots Cu distance of 3.375 (2) Å in a copper(I) complex containing an S-bridging ligand and bidentate bridging dppm, $[Cu_2I_2(C_3H_8N_2S)(C_{25}H_{22}P_2)_2] \cdot 1.5CH_3CN$ (Nimthong *et al.*,

$Cg6$ is the centroid of the C20–C25 ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
C12–H12 \cdots N2	0.95	2.56	3.438 (4)	154
C44–H44 \cdots S1	0.95	2.87	3.751 (3)	154
C50–H50 \cdots N3 ⁱ	0.95	2.57	3.462 (5)	156
C55–H55C \cdots N4 ⁱⁱ	0.98	2.57	3.338 (5)	136
N1–H1A \cdots Br2	0.84 (2)	2.74 (2)	3.580 (3)	172 (4)
N1–H1B \cdots Br2 ⁱⁱⁱ	0.85 (2)	2.61 (2)	3.415 (3)	158 (3)
N2–H2A \cdots Br1	0.85 (2)	2.63 (2)	3.468 (3)	166 (3)
C31–H31 \cdots Cg6	0.95	2.97	3.476 (3)	115

Symmetry codes: (i) $-x + 1, y + \frac{1}{2}, -z + \frac{1}{2}$; (ii) $-x, y - \frac{1}{2}, -z + \frac{1}{2}$; (iii) $-x, -y + 2, -z$.

2013) and much longer than 2.8 Å which is the sum of the van der Waals radii of the copper atoms (Yam *et al.*, 2001). The Cu–P bond lengths in (I) (Table 1) range from 2.2604 (8) to 2.2803 (8) Å and the Cu–S bond lengths of the bridges, 2.3543 (8) and 2.3520 (8) Å, are likewise similar to those in the above mentioned complex [Cu–P = 2.2563 (10)–2.2786 (11) Å; Cu–S = 2.3450 (11) and 2.3493 (11) Å]. The Cu1–Br1 and Cu2–Br2 bond lengths of 2.5126 (4) and 2.5238 (4) Å, respectively, are slightly longer than the Cu–Br(terminal) [2.4826 (5) Å] for $[CuBr(PPh_3)_3] \cdot CH_3CN$ (Altaf & Stoeckli-Evans, 2010).

The intramolecular interaction C44–H44 \cdots S1 (Table 2) has an effect on the Cu1–S1–Cu2 plane, bending it from the Cu_2P_2 plane of the Cu1–S1–Cu2–P3–C38–P4 chair conformation by an angle [72.59 (3) $^\circ$] that is significantly larger than that for the Cu1–S1–Cu2–P1–C13–P2 plane [45.68 (2) $^\circ$]. Thus, the C–H \cdots S effect might be the influence that leads to the longer distance between the centroids ($Cg8$: C39–C44, $Cg9$: C45–C50; $Cg4$: C7–C12 and $Cg5$: C13–C18) of the phenyl rings, $Cg8\cdots Cg9$ [4.0356 (17) Å] compared with the $Cg4\cdots Cg5$ distance [3.6097 (19) Å]. The intramolecular C–H \cdots π interaction (C31–H31 \cdots Cg6) also imposes a contact of 3.476 (3) Å, between the Csp^2 atom of the phenyl ring and another phenyl ring centroid (C20–C25) of the other dppm ligand. An interaction (C12–H12 \cdots N2) between $Cg5$ and the NH₂ group is also observed. In addition, two intramolecular N–H \cdots Br interactions are found between the NH₂ group of ATU and Br atoms. A perspective view of all the intramolecular interactions in (I) is depicted in Fig. 2.

3. Supramolecular features

In the crystal, neighbouring dinuclear molecules form a hydrogen-bonded dimer held together by two N–H \cdots Br bonds as a cyclic pattern with its symmetry-equivalent

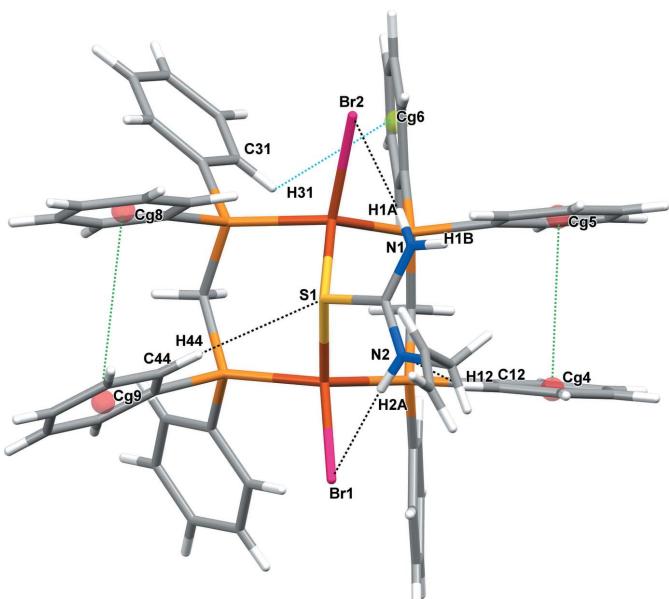

Figure 2
Intramolecular interactions in (I)

partner, generated by a crystallographic inversion center (symmetry code: $-x, 2 - y, -z$), which generates $R_4^2(8)$ loops. Moreover, the dimers are linked together by very weak $\pi\text{-}\pi$ stacking of the $Cg8\cdots Cg8^{iii}$ rings [3.9338 (16) Å, symmetry code: (iii) $1 - x, 2 - y, -z$] generating a chain of alternating $N\text{--}H\cdots\cdot\cdot\cdot\text{Br}$ links and $\pi\text{-}\pi$ stacking running along [100], as shown in Fig. 3. The N atoms of the acetonitrile solvent molecules both accept $C\text{--}H\cdots\cdot\cdot\cdot N$ interactions ($C55\cdots$

$H55\cdots N4^{ii}$ and $C50\cdots H50\cdots N3^i$; symmetry codes: (i) $-x + 1, y + \frac{1}{2}, -z + \frac{1}{2}$, (ii) $= -x, y - \frac{1}{2}, -z + \frac{1}{2}$) from the dppm phenyl rings. Numerical details of the hydrogen-bond geometry are given in Table 2.

4. Database survey

A search of the Cambridge Structural Database (Version 5.36, update November 2014; Groom & Allen, 2014) found 309 complexes of copper(I) with mixed dppm and other ligands. There are six copper(I) complexes with an ATU ligand, three complexes containing only an ATU ligand and three complexes containing a mixed ATU and other ligands. However, there is only one structure that has a similar core structure and coordination mode to the title compound, $[\text{Cu}_2\text{I}_2(\text{C}_3\text{H}_8\text{N}_2\text{S})(\text{dppm})_2]\cdot 1.5\text{CH}_3\text{CN}$, studied by Nimthong *et al.* (2013).

5. Synthesis and crystallization

Copper(I) bromide (0.07 g, 0.49 mmol) was added to a solution of 1,1-bis(diphenylphosphino)methane (0.19 g, 0.50 mmol) in 30 ml acetonitrile at 338 K. The mixture was refluxed for two h and a white precipitate was formed. After that, *N*-allylthiourea (0.06 g, 0.52 mmol) was added and further refluxed for four h and the precipitate slowly disappeared. Colorless crystals were obtained after the clear solution was left to evaporate at room temperature for a few days. The yield was 33% based on CuBr. Calculated for

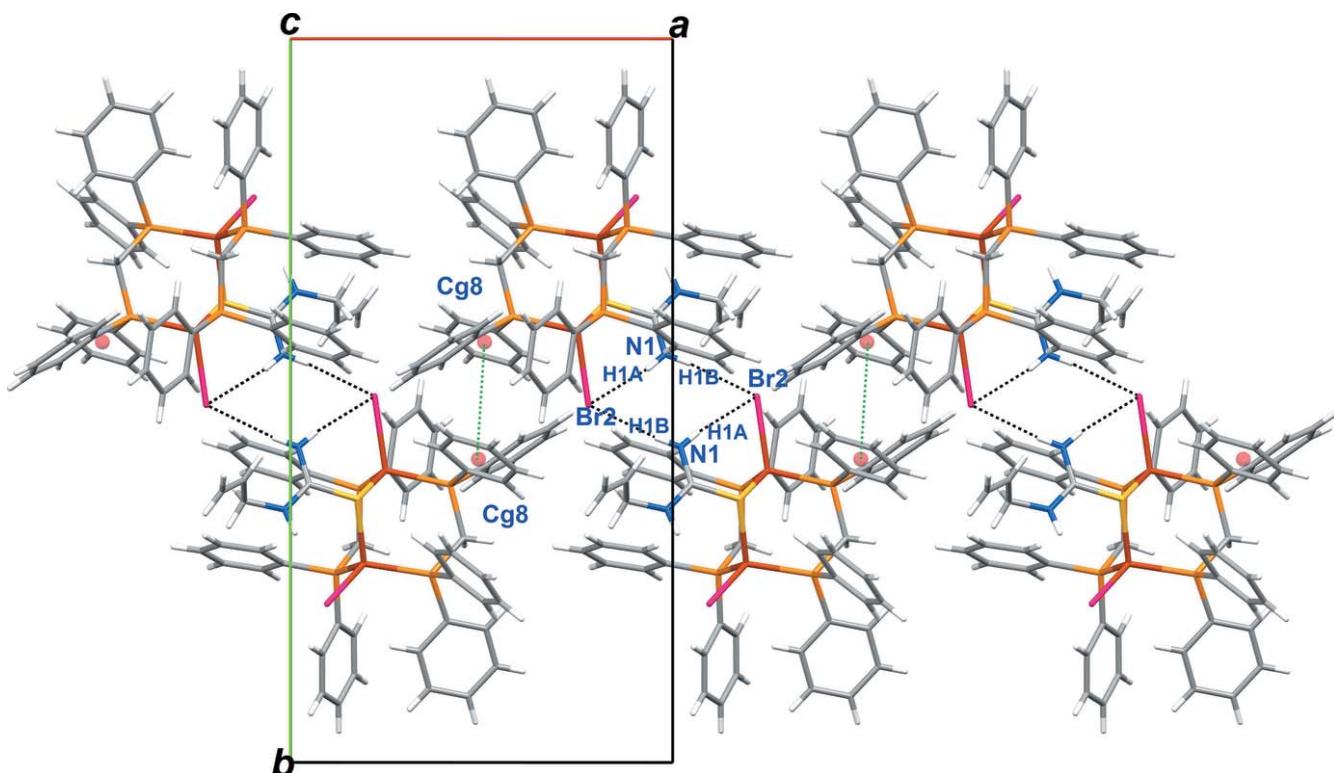

Figure 3
A chain in the structure of (I) mediated by $N\text{--}H\cdots\cdot\cdot\cdot\text{Br}$ hydrogen bonds and aromatic $\pi\text{-}\pi$ stacking.

$C_{58}H_{58}Br_2Cu_2N_4P_4S$: C 55.55, H 4.66, N 4.47 and S 2.56%. Found: C 55.28, H 4.28, N 3.68 and S 2.54%. The main IR bands (KBr disc, cm^{-1}): 3282 [$\nu(\text{NH}_2)$], 3168 [$\nu(\text{NH}_2)$], 3058 [$\nu(=\text{C}-\text{H})_{\text{ph}}$], 1580 [$\nu(\text{C}=\text{S})$] and 1110 [$\nu(\text{P}-\text{C}_{\text{ph}})$].

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. Hydrogen atoms bonded to carbon were included at geometrically idealized positions and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$. The N—H atoms were located in a difference map and the coordinates were refined with an N—H distance restraint of 0.86 Å and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.

Acknowledgements

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Hydrogen-bond geometry (Å, °)

Cg6 is the centroid of the C20—C25 ring.

D—H···A	D—H	H···A	D···A	D—H···A
