Received 11 December 2007; accepted 24 December 2007

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.073; wR factor = 0.233; data-to-parameter ratio = 18.3.

The molecule of the title compound, $\text{C}_{14}\text{H}_{12}\text{ClNO}$, adopts the enol-imine tautomeric form, with an intramolecular $\text{O}-\text{H}\cdots\text{N}$ hydrogen bond. In the molecule, the two benzene rings are twisted with respect to each other by $30.6(2)^\circ$. The crystal structure is stabilized by intermolecular $\text{C}-\text{H}\cdots\pi$ interactions.

Ö. Deveci, S. Isik, F. Ersahin and E. Agar

Comment

Most Schiff bases have antibacterial, anticancer, anti-inflammatory and antitoxic properties (Williams, 1972). In addition, Schiff bases have been used extensively as ligands in the field of coordination chemistry (Garnovski *et al.*, 1993). There is considerable interest in Schiff base complexes due to their striking anti-tumour activities (Zhou *et al.*, 2000). Schiff base compounds show photochromism and thermochromism in the solid state by proton transfer from the hydroxyl O atom to the imine N atom (Cohen *et al.*, 1964; Hadjoudis *et al.*, 1987). Photochromic compounds are of great interest for the control and measurement of radiation intensity, optical computers and display systems (Dürr & Bouas-Laurent *et al.*, 1990).

There are two possible types of intramolecular hydrogen bonds in Schiff bases, *viz.* the keto-amine ($\text{N}-\text{H}\cdots\text{O}$) and enol-imine ($\text{O}-\text{H}\cdots\text{N}$) tautomeric forms. X-ray investigation shows that (I) prefers the enol-imine tautomeric form. The molecular structure of (I) is shown in Fig. 1, with the atom-numbering scheme. Selected bond lengths and angles are listed in Table 1. The C13—O1 and C7=N1 bond lengths verify the enol-imine form. The same bonds can be compared with the corresponding distances in (E)-*N*-(2-fluoro-3-methoxy)- salicylald-imine [1.347 (3) Å and 1.280 (3) Å; Ünver *et al.*, 2002] and (E)-*N*-(3,5-bis(trifluoromethyl)phenyl)-3-methoxysalicylaldimine [1.352 (3) Å and 1.280 (4) Å; Karadayı *et al.*, 2003], which exist in the enol-imine tautomeric form. The dihedral angle between the two benzene rings is 30.6 (2)°. The title molecule has a strong intramolecular O—H···N hydrogen bond between atoms N1 and O1 (Table 2). This type of strong intramolecular hydrogen bond is a common feature of *o*-hydroxysalicylidene systems (Filarowski *et al.*, 2003; Yıldız *et al.*, 1998; Odabaşoğlu *et al.*, 2003). The O—H···N hydrogen-bonded ring is almost coplanar with the adjacent ring, with an N1—C7—C8—C13 torsion angle of 3.4 (6)°. In the crystal there are also C—H···π interactions between C14-methyl group and C1ⁱ-containing benzene ring [symmetry code: (i) $-1/2 + x, y, 1/2 - z$] (Fig. 2), $\text{C}14-\text{H}15\text{B}-\text{Cg}1^i = 174^\circ$, $\text{H}15\text{B}\cdots\text{Cg}1^i = 2.83$ and $\text{C}14\cdots\text{Cg}1^i = 3.849$ (6) Å ($\text{Cg}1$ is centroid of the C1-containing benzene ring).

Experimental

The title compound was prepared by reflux a mixture of a solution containing 5-methylsalicylaldehyde (0.05 g, 0.367 mmol) in 20 ml ethanol and a solution containing 2-kloranilin (0.0447 g, 0.367 mmol) in 20 ml ethanol. The reaction mixture was stirred for 2 h under reflux. The crystals suitable for X-ray analysis were obtained from an ethanol solution by slow evaporation (yield % 80).

Refinement

H atoms were positioned geometrically and treated using a riding model with $\text{C}-\text{H} = 0.93, 0.96, 0.82$ and 0.93 Å for CH, CH_3 , OH and CH (aromatic), respectively. $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl or $1.2U_{\text{eq}}(\text{C}, \text{N})$ for others.

Crystal data

C ₁₄ H ₁₂ ClNO	$D_x = 1.325 \text{ Mg m}^{-3}$
$M_r = 245.70$	Melting point: 356–358 K
Orthorhombic, <i>Pbca</i>	Mo $K\alpha$ radiation
Hall symbol: -P 2ac 2ab	$\lambda = 0.71073 \text{ \AA}$
$a = 7.5121 (7) \text{ \AA}$	Cell parameters from 5622 reflections
$b = 11.9190 (15) \text{ \AA}$	$\theta = 27.1\text{--}2.2^\circ$
$c = 27.500 (3) \text{ \AA}$	$\mu = 0.29 \text{ mm}^{-1}$
$V = 2462.3 (5) \text{ \AA}^3$	$T = 296 (2) \text{ K}$
$Z = 8$	Prism, yellow
$F_{000} = 1024$	$0.8 \times 0.23 \times 0.09 \text{ mm}$

Data collection

Stoe IPDS-2 diffractometer	2428 independent reflections
Radiation source: fine-focus sealed tube	833 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.133$
Detector resolution: 6.67 pixels mm^{-1}	$\theta_{\text{max}} = 26.0^\circ$
$T = 296(2) \text{ K}$	$\theta_{\text{min}} = 3.0^\circ$
rotation method scans	$h = -9 \rightarrow 8$
Absorption correction: none	$k = -14 \rightarrow 14$
14292 measured reflections	$l = -33 \rightarrow 33$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.073$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.233$	$w = 1/[\sigma^2(F_o^2) + (0.1247P)^2]$

$S = 0.81$	where $P = (F_o^2 + 2F_c^2)/3$
2428 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
133 parameters	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.34 \text{ e \AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and $R-$ factors based on ALL data will be even larger.
