Received 22 January 2009; accepted 4 February 2009

Key indicators: single-crystal X-ray study;  $T = 294\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.042;  $wR$  factor = 0.136; data-to-parameter ratio = 18.4.

In the molecule of the title compound,  $\text{C}_{16}\text{H}_{14}\text{O}_2$ , the aromatic rings are oriented at a dihedral angle of  $78.49(3)^\circ$ . The heterocyclic ring adopts a twist conformation. In the crystal structure, intermolecular  $\text{C}-\text{H} \cdots \text{O}$  hydrogen bonds link the molecules into chains along the  $c$  axis.

### **3-Benzylisochroman-1-one**

**T. M. Babar, G. Qadeer, N. H. Rama, M. Khawar Rauf and W.-Y. Wong**

#### **Comment**

The title compound was prepared in order to evaluate its potential as antibacterial and antifungal agents. The CCDC search (Allen, 2002) showed that the crystal structures of rac-*exo*-tricarbonyl-(h6-3-phenyl isochromanone)-chromium (Schnebel *et al.*, 2003) and 3,4-dihydro-8-hydroxy-3-(4-hydroxy- phenyl)-isocoumarin (Schmalle *et al.*, 1982) have been reported, which have close resemblance as far as isochromane and attached phenyl ring is considered. We report herein the synthesis and crystal structure of the title compound.

In the molecule of the title compound (Fig. 1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Rings A (C1-C6) and C (C11-C16) are, of course, planar, and they are oriented at a dihedral angle of 78.49 (3)°. Ring B (O2/C5-C9) is not planar, having total puckering amplitude,  $Q_T$ , of 2.420 (3) Å and twisted conformation [ $\phi = 151.98$  (3)° and  $\theta = 88.50$  (3)°] (Cremer & Pople, 1975).

In the crystal structure, intermolecular C-H···O hydrogen bonds (Table 1) link the molecules into chains along the c axis, in which they may be effective in the stabilization of the structure.

#### **Experimental**

As shown in Scheme 2, a mixture of homophthalic acid (1.98 g, 11.0 mmol) and 2-phenylacetyl chloride (7.08 g, 46 mmol) was heated under reflux for 6 h at 473 K. After concentration, the residue was chromatographed on silica gel column using petroleum ether (333–353 K) to give 3-benzyl-1*H*-isochromen-1-one. 2-(2-oxo-3-phenylpropyl) benzoic acid was obtained by refluxing a solution of 3-benzyl-1*H*-isochromen-1-one (4 g, 15.9 mmol) in ethanol (200 ml) and potassium hydroxide (5%, 200 ml) for 6 h. NaBH4 (1.6 g) was added to a solution of 2-(2-oxo-3-phenylpropyl) benzoic acid (4.81 g, 17.8 mmol) in sodium hydroxide (1%, 180 ml) and the resulting solution was stirred overnight at room temperature. After being acidified with HCl, the whole mixture was extracted with dichloromethane (2 \ times 15 ml). Usual work-up gave crude racemic hydroxy-acid, 2-(2-hydroxy-3-phenylpropyl)benzoic acid, which was dissolved in acetic anhydride (5 ml) and heated under reflux for 2 h to get the title compound (yield; 73%, m.p. 605–606 K). The crude compound was purified by column chromatography on silica gel with petroleum ether and recrystallized in ethanol.

#### **Refinement**

H atoms were positioned geometrically, with C-H = 0.93, 0.98 and 0.97 Å for aromatic, methine and methylene H, respectively, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

### Crystal data

C <sub>16</sub> H <sub>14</sub> O <sub>2</sub>	$F_{000} = 504$
$M_r = 238.27$	$D_x = 1.254 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Melting point: 332(1) K
Hall symbol: -P 2ybc	Mo $K\alpha$ radiation
$a = 12.503 (5) \text{ \AA}$	$\lambda = 0.71073 \text{ \AA}$
$b = 8.0200 (9) \text{ \AA}$	Cell parameters from 1316 reflections
$c = 12.892 (5) \text{ \AA}$	$\theta = 5.3\text{--}25.2^\circ$
$\beta = 102.43 (2)^\circ$	$\mu = 0.08 \text{ mm}^{-1}$
$V = 1262.4 (7) \text{ \AA}^3$	$T = 294 \text{ K}$
$Z = 4$	Block, colorless
	$0.32 \times 0.26 \times 0.21 \text{ mm}$

### Data collection

Bruker SMART CCD area-detector

3024 independent reflections

diffractometer	
Radiation source: fine-focus sealed tube	2546 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.021$
$T = 294 \text{ K}$	$\theta_{\text{max}} = 28.5^\circ$
$\omega$ and $\varphi$ scans	$\theta_{\text{min}} = 3.0^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2001)	$h = -16 \rightarrow 16$
$T_{\text{min}} = 0.820, T_{\text{max}} = 0.983$	$k = -10 \rightarrow 10$
7148 measured reflections	$l = -10 \rightarrow 17$

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.042$	$w = 1/[\sigma^2(F_o^2) + (0.0818P)^2 + 0.1131P]$
$wR(F^2) = 0.136$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\text{max}} < 0.001$
3024 reflections	$\Delta\rho_{\text{max}} = 0.18 \text{ e \AA}^{-3}$
164 parameters	$\Delta\rho_{\text{min}} = -0.14 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{1/4}$
Secondary atom site location: difference Fourier map	Extinction coefficient: 0.058 (7)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
