Received 6 July 2010; accepted 8 July 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.034; wR factor = 0.086; data-to-parameter ratio = 17.5.

An N—H···Cl hydrogen bond connects the ions in the title salt, $C_{18}H_{16}NO^{+}\cdot Cl^{-}$. The quinolin-1-ium residue is almost planar (r.m.s. deviation = 0.020 Å) but both the acetyl group [O—C—C—C torsion angle = 62.73 (17)°] and adjacent benzene ring [C—C—C—C torsion angle = −104.06 (14)°] are twisted out of this plane; the acetyl and benzene substituents are non-parallel [dihedral angle = 66.16 (7)°]. The crystal packing is consolidated by C—H···O and C—H···Cl contacts.

3-Acetyl-2-methyl-4-phenylquinolin-1-ium chloride

K. Kiran, S. Sarveswari, V. Vijayakumar, K. W. Tan and E. R. T. Tiekink

Comment

The potential pharmacological properties of quinoline derivatives (Musiol *et al.*, 2006) motivate our studies into the structural chemistry of such derivatives (Kaiser *et al.*, 2009; Viji *et al.*, 2010). Herein, the crystal and molecular structure of the title salt is described.

The asymmetric unit comprises a 3-acetyl-2-methyl-4-phenylquinolin-1-ium cation and a chloride anion, being connected by a N–H···Cl hydrogen bond, Fig. 1 and Table 1. The non-hydrogen atoms comprising the quinolin-1-ium residue are planar with a r.m.s. deviation of 0.020 Å. The acetyl group at C3 and the adjacent benzene ring are twisted out of the plane of the quinolin-1-ium residue as seen in the values of the O1–C2–C3–C4 and C10–C11–C13–C14 torsion angles of 62.73 (17) and -104.06 (14) °, respectively. The acetyl and benzene substituents are splayed as seen in the dihedral angle formed between them of 66.16 (7) °.

In addition to the N–H···Cl hydrogen bond, the crystal structure features C–H···O and C–H···Cl contacts. The former lead to supramolecular chains along the *b* axis and these are consolidated in three-dimensions by the C–H···Cl contacts, Fig. 2 and Table 1.

Experimental

A mixture of 2-aminobenzophenone (0.01 *M*), acetylacetone (0.01 *M*) and a catalytic amount of conc. HCl was irradiated under 240 W for about 5 min. The resultant solid was filtered, dried and purified by column chromatography using a 1:1 mixture of ethyl acetate and petroleum ether, and recrystallized using ethanol. *M*.pt. 371–373 K. Yield: 65%.

Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.95 to 0.98 Å) and were included in the refinement in the riding model approximation, with U_{iso}(H) set to 1.2 to 1.5U_{equiv}(C). The pyridinium-H atom was refined with the distance restraint N–H = 0.88±0.1 Å, and with U_{iso}(H) = 1.2U_{equiv}(N).

Figures

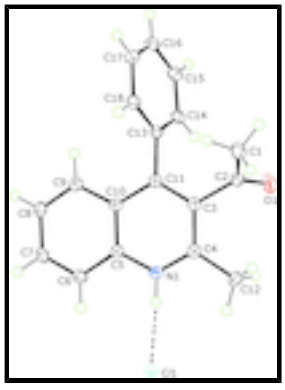

Fig. 1. The molecular structure of (I) showing displacement ellipsoids at the 50° probability level.

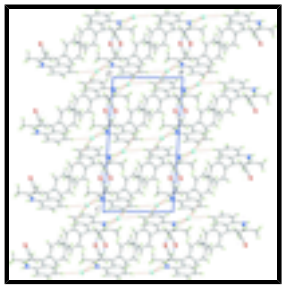

Fig. 2. 2-D array formed in the ($\bar{1}$ 0 1) plane in (I) mediated by C–H···O and Cl···O contacts shown as orange and purple dashed lines, respectively.

3-Acetyl-2-methyl-4-phenylquinolin-1-ium chloride

Crystal data

$C_{18}H_{16}NO^{+}\cdot Cl^{-}$	$F(000) = 624$
$M_r = 297.77$	$D_x = 1.333$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 6610 reflections
$a = 9.5046$ (8) Å	$\theta = 2.6$–$28.2°$
$b = 8.5787$ (8) Å	$\mu = 0.26$ mm^{-1}
$c = 18.2538$ (16) Å	$T = 100$ K
$\beta = 94.282$ (1)°	Block, colourless
$V = 1484.2$ (2) Å^3	0.32 × 0.23 × 0.17 mm
$Z = 4$	

Data collection

Bruker SMART APEX diffractometer	3409 independent reflections
Radiation source: fine-focus sealed tube	3047 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.028$
ω scans	$\theta_{max} = 27.5°$, $\theta_{min} = 2.2°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -12 \rightarrow 12$
$T_{min} = 0.972$, $T_{max} = 0.980$	$k = -10 \rightarrow 11$

13696 measured reflections	$l = -23 \rightarrow 23$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.034$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.086$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0335P)^2 + 0.8555P]$ where $P = (F_o^2 + 2F_c^2)/3$
3409 reflections	$(\Delta/\sigma)_{max} = 0.001$
195 parameters	$\Delta\rho_{max} = 0.34$ e Å^{-3}
1 restraint	$\Delta\rho_{min} = -0.18$ e Å^{-3}

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
