Received 25 August 2010; accepted 9 September 2010

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.062;  $wR$  factor = 0.166; data-to-parameter ratio = 12.3.

The asymmetric unit of the title compound,  $C_{34}H_{30}N_2O_4$ , contains four independent half-molecules, the complete molecules being generated by inversion symmetry. The molecules each have planar (within  $4\sigma$ ) perylenetetracarboxylic diimide fragments with bent side chains. In one of the independent molecules, each 3-pentyl fragment is disordered over two conformations in a 7:3 ratio. In the crystal,  $\pi-\pi$  interactions link molecules into stacks propagated in [010]. The crystal packing also exhibits weak intermolecular C–H $\cdots$ O hydrogen bonds.

### Comment

The derivatives of perylene tetracarboxylic diimide (PTCDI) have long been a focus of research for their wide applications. These compounds are well known as industrially important organic pigments, which exhibit a variety of colours (Herbst & Hunger, 1993). The correlations between the colour of the crystals and the different arrangement of the molecules in the stacks were discussed in details by Graser and Hädicke (Graser and Hädicke, 1980, 1984). Besides, the derivatives of perylenediimide are extremely robust, commercially available materials with high photo and thermal stability (Newman, 2004). More recently the PTCDI's are also of interest as the n-type semiconductors, in contrast to the more common *p*-type counterparts in organic semiconductors, making them attractive candidates for fabrication of various organic electronic elements (Wiatrowski *et al.*, 2010; Dodabalapur, 2006; Miśkiewicz, 2006; Wurthner, 2004; Tracz, 1981). The crystal and molecular structure of the title compound reported here have been determined as part of an investigation on the charge transport properties of organic semiconductors caused by electronic coupling between stacking molecules. The unit structure of the PTCDI is illustrated in Fig. 1. Neighbouring molecules are arranged in stacks (Fig. 2), where the stacking distance is about 3.35 Å, with their long axes tilted in relation to the column grow direction. Typical hydrogen bonds are not observed.

### Experimental

All chemicals used were commercially available. PTCDI-C5(3) was provided SynTech GmbH. The single crystals were grown by slow evaporation from a nitrobenzene solution of the title compound at room temperature. After several weeks poor quality, weakly diffracted dark red needle crystals were obtained. The structure was determined by single-crystal diffraction.

### Refinement

All hydrogen atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C—H = 0.93 - 0.97 Å and with  $U_{\text{iso}}(\text{H}) = 1.2\text{-}1.5 U_{\text{eq}}(\text{C})$ . The terminal ethyl groups in one of the molecules were treated as disordered over two sets of positions using restraints on the anisotropic displacement, with the occupancies fixed to 0.7 and 0.3, respectively.

### Figures

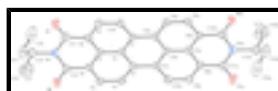

Fig. 1. One independent molecule of the title compound showing the atomic numbering and 30% probability displacement ellipsoids [symmetry code: (a)  $-x, 1 - y, -z$ ]. All H atoms have been omitted for clarity.

Monoclinic, <i>P2</i> <sub>1</sub> / <i>c</i>	Mo <i>Kα</i> radiation, $\lambda$ = 0.71073 Å
Hall symbol: -P 2ybc	Cell parameters from 9930 reflections
<i>a</i> = 34.009 (4) Å	$\theta$ = 2.4–26.2°
<i>b</i> = 7.5035 (10) Å	$\mu$ = 0.09 mm <sup>-1</sup>
<i>c</i> = 21.248 (3) Å	<i>T</i> = 296 K
$\beta$ = 100.562 (2)°	Needle, dark red
<i>V</i> = 5330.3 (12) Å <sup>3</sup>	0.40 × 0.05 × 0.05 mm
<i>Z</i> = 8	

#### Data collection

Bruker APEXII CCD diffractometer	9351 independent reflections
Radiation source: fine-focus sealed tube graphite	6350 reflections with $I > 2\sigma(I)$
$\omega$ scan	$R_{\text{int}} = 0.051$
Absorption correction: multi-scan ( <i>SADABS</i> ; Sheldrick, 2002)	$\theta_{\text{max}} = 25.0^\circ$ , $\theta_{\text{min}} = 1.8^\circ$
$T_{\text{min}} = 0.966$ , $T_{\text{max}} = 0.996$	$h = -40 \rightarrow 40$
85917 measured reflections	$k = -8 \rightarrow 8$
	$l = -25 \rightarrow 25$

#### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.062$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.166$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0469P)^2 + 6.5326P]$ where $P = (F_o^2 + 2F_c^2)/3$

9351 reflections	$(\Delta/\sigma)_{\max} < 0.001$
760 parameters	$\Delta\rho_{\max} = 0.24 \text{ e \AA}^{-3}$
871 restraints	$\Delta\rho_{\min} = -0.21 \text{ e \AA}^{-3}$

*Special details*

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
