#### Abstract

All four chiral pestalotin diastereomers were synthesized in a straightforward and divergent manner from common ( $R$ )-glycidol. Catalytic asymmetric Mukaiyama aldol reactions of readily-available bis(TMSO)diene (Chan's diene) with (S)-2-benzyloxyhexanal derived from $(R)$-glycidol produced a syn-aldol adduct with high diastereoselectivity and enantioselectivity using a $\mathrm{Ti}(\mathrm{iOPr})_{4} /(\mathrm{S})$-BINOL/LiCl catalyst. Diastereoselective Mukaiyama aldol reactions mediated by catalytic achiral Lewis acids directly produced not only a ( $1^{\prime} S, 6 S$ )-pyrone precursor via the syn-aldol adduct using $\mathrm{TiCl}_{4}$, but also ( $1^{\prime} \mathrm{S}, 6 \mathrm{R}$ )-pyrone precursor via the antialdol adduct using $\mathrm{ZrCl}_{4}$, in a stereocomplementary manner. A Hetero-Diels-Alder reaction of similarly available mono(TMSO)diene (Brassard's diene) with ( $S$ )-2-benzyloxyhexanal produced the ( $1^{\prime} S, 6 S$ )-pyrone precursor promoted by $\mathrm{Eu}(\mathrm{fod})_{3}$ and the $\left(1^{\prime} \mathrm{S}, 6 R\right)$-pyrone precursor $\mathrm{Et}_{2} \mathrm{AlCl}$. Debenzylation of the ( $1^{\prime} S, 6 S$ )-precursor and the ( $1^{\prime} S, 6 R$ )-precursor furnished natural ( - )-pestalotin ( $99 \%$ ee, 7 steps) and unnatural (+)-epipestalotin ( $99 \%$ ee, 7 steps), respectively. Mitsunobu inversions of the obtained $(-)$-pestalotin and $(+)$-epipestalotin successfully produced the unnatural ( + )-pestalotin ( $99 \%$ ee, 9 steps) and ( - )-epipestalotin ( $99 \%$ ee, 9 steps), respectively, in a divergent manner. All four of the obtained chiral pestalotin diastereomers possessed high chemical and optical purities (optical rotations, ${ }^{1} \mathrm{H}-\mathrm{NMR},{ }^{13} \mathrm{C}-\mathrm{NMR}$, and HPLC measurements).

Keywords: asymmetric total synthesis; divergent synthesis; pyran-2-one; pestalotin; epipestalotin; asymmetric Mukaiyama aldol reaction; hetero Diels-Alder reaction; Mitsunobu inversion; Chan's diene; Brassard's diene

## 1. Introduction

Products possessing the 4-methoxy-5,6-dihydroxy-pyran-2-one structure are distributed in nature [1], including the (i) kavalactone series, such as kavain, methylsitan, dihydrokavain, dihydromethylsitan, etc. [2], and (ii) (-)-pestalotin [3], with the three unnatural diastereomers of (-)-epipestalotin, (+)-pestalotin, and (+)-epipestalotin (Figure 1). (-)-Pestalotin was isolated from Pesalotia cryptomeriaecola Sawada by Kimura and Tamura's group; it possesses distinctive bioactivity as a gibberellin synergist [3-5]. Independently, the same compound was isolated from unidentified penicillium species as a minor component (code number: LLP-880 $\alpha$ ) by Ellestad's group [6].

(-)-Pestalotin has received considerable attention as a synthetic target due to its characteristic structure, which includes two consecutive stereogenic centers. Several asymmetric total syntheses of $(-)$-pestalotin have therefore been performed to date, and the features are described in chronologic order of their development: (i) Dianion addition using ethyl acetoacetate with aldehyde containing a 1,3-dithian group, and successive asymmetric reduction using a chiral lithium hydro aluminate derived from chiral diamino tartrate, but with ca. 10\% ee (Seebach's group) [7]; (ii) Sharpless asymmetric kinetic resolution of allyl alcohol producing (-)-pestalotin and diastereomeric (-)-epipestalotin, and chiral pool synthesis starting from glycel aldehyde acetonide derived from d-mannitol to produce antipodal (+)-pestalotin and (+)-epipestalotin (Mori's group) [8,9]; (iii) Derivatization of chiral diethyl tartarate and the incorporation of a tosyl group as a latent scaffold (Masaki's group) [10]; (iv) Asymmetric reduction using (S)-alpine-borane reagent of ethynyl ketone intermediate and successive hetero-Diels-Alder reaction with Brassard's siloxydiene [11] (Midland and Graham) [12]; (v) Chiral pool synthesis using unnatural (S)-norleucine, associated with successive syn-diastereoselective Mukaiyama aldol additions using Chan's 1,3-disiloxydiene [13] (Hagiwara's group) [14,15]; (vi) Cycloaddition strategy for chiral 1,2-diol with chiral induction utilizing Oppolzer's camphor sultum (Curran and Zhang) [16]; (vii) Sharpless asymmetric dihydroxylation of ester including a non-conjugated ene-yne precursor (Wang and Shen) [17]; and (viii) Sharpless asymmetric dihydroxylation of ethyl heptenoate and successive $\beta$-ketoester formation via Birch reduction of the $m$-methoxyphenyl ring (Rao's group) [18].

A review of these fruitful works revealed that the synthesis of all four pestalotin diastereomers is limited to the report by Mori's group [9]. The syntheses are somewhat lengthy [(-)-pestalotin: 8 steps, $4 \%$ overall yield; (-)-epipestalotin: 6 steps, $9 \%$ overall yield; (+)-pestalotin: 10 steps, $1 \%$ overall yield; (+)-epipestalotin: 10 steps, $3 \%$ overall yield], and commence with two quite different starting compounds. Nonetheless, this work contributed significantly to clarifying the stereostructure-activity relationship of these families; $1^{\prime} S$ configuration in the side chain was critical for the synergistic mode of action for gibberellin [6,9].

On the other hand, there are three natural 3-acyl-4-hydroxy-5,6-dihydroxy-pyran-2-one products relevant to 4-methoxy-5,6-dihydroxy-pyran-2-ones: $(R)$-podoblastins [19], ( $R$ )-lachnelluloic acid [20], and alternaric acid [21] (Figure 2). We previously reported asymmetric total syntheses of all these natural products utilizing a catalytic asymmetric Mukaiyama aldol reaction and an asymmetric Ti-Claisen condensation as the crucial steps [22,23].

(R)-Podoblastins-S

(R)-Lachnelluloic acid

Alternaric acid

Figure 2. All three 3-acyl-5,6-dihydro-2H-pyran-2-one natural products.
Consistent with our expeditious total syntheses of all these compounds, we envisaged a divergent synthetic access to all four chiral pestalotin diastereomers starting from a common and readily-available chiral building block, i.e., (R)-glycidol.

## 2. Results and Discussion

### 2.1. General Strategy for the Total Syntheses of All Four Pestalotin Diastereomers

A couple of the present divergent strategies involve a catalytic asymmetric and a diastereoselective Mukaiyama aldol addition, and a diastereoselective hetero-Diels-Alder reaction, followed by a Mitsunobu inversion as the crucial steps (Scheme 1). (R)-Glycidol is transformed to a common starting (S)-2-benzyloxyhexanal (1) by the epoxide opening with a Grignard reagent. Syn- and anti-selective Mukaiyama aldol additions of readily-available bis(TMSO)diene (so-called Chan's diene) 2 [13] with (S)-aldehyde 1 produce stereocomplementary chiral aldol adducts syn-3 and anti-3, respectively. Alternatively, syn- and anti-selective hetero-Diels-Alder reactions of similarly available mono(TMSO)diene (so-called Brassard's diene) 4 [11,24] with 1 produce diastereomeric chiral pyrone-adducts syn-5 and anti-5, respectively. Following a conventional synthetic procedure [15], syn-3 and anti-3 are transformed to (-)-pestalotin and (+)-epipestalotin, respectively. Mitsunobu inversions of ( - )-pestalotin and $(+)$-epipestalotin produce $(-)$-epipestalotin and (+)-pestalotin, respectively.

Scheme 1. Strategies for asymmetric total syntheses of pestalotin diastereomers.

### 2.2. Total Syntheses of All Four Pestalotin Diastereomers

Synthesis of (S)-2-benzyloxyhexanal (1)
(S)-2-Benzyloxyhexanal (1) was synthesized from $(R)$-glycidol as shown in Scheme 2. ( $R$ )-Glycidol was converted to trityl ether 6 (or commercially available) as a crude solid, which was purified by recrystallization ( $83 \%$ yield). CuI-catalyzed Grignard reaction of $n-\mathrm{PrMgBr}$ with epoxide 6 [25] gave secondary alcohol 7 in $93 \%$ yield. After the benzyl group protection of 7 , the trityl group was removed using a PTS $\bullet \mathrm{H}_{2} \mathrm{O}$ catalyst to afford primary alcohol 8 in $92 \%$ yield ( 2 steps). Finally, TEMPO (or Swern) oxidation of 8 produced (S)-2-benzyloxyhexanal 1 in $86 \%$ (or $97 \%$ ) yield. Because of its easier recrystallization purification procedure, trityl protection method was selected instead of an alternative $p$-methoxybenzyl protective method. The present sequence (four steps and $61 \%$ overall yield) is superior regarding steps and overall yield compared with the relevant reported route starting from (S)-norleucine (five steps and 27\% overall yield) [14].

Scheme 2. Synthesis of common (S)- $\alpha$-benzyloxy aldehyde 1.

### 2.3. Catalytic Asymmetric and Diastereoselective Mukaiyama Aldol Reactions

With (S)-aldehyde $\mathbf{1}$ in hand, we next investigated a catalytic asymmetric Mukaiyama aldol reaction using readily-available Chan's diene 2 [13] with $\mathbf{1}$ (Scheme 3). For this purpose, we employed the procedure applied for the asymmetric syntheses of $(R)$-podoblastin- $S$ and $(R)$-lachnelluloic acid [22], as well as that described in Organic Syntheses, recently [26]. The reaction by using catalysis of $\mathrm{Ti}(i \mathrm{OPr})_{4}$ ( $2 \mathrm{~mol} \%$ )/(S)-BINOL ( $2 \mathrm{~mol} \%$ )/ $\mathrm{LiCl}(4 \mathrm{~mol} \%$ ) and subsequent treatment with PPTS/MeOH afforded the desired aldol adduct syn-3 in $31 \%$ yield with high diastereoselectivity and enantioselectivity [syn/anti $=93: 7,85 \%$ ee (C-5 position) by HPLC analysis].

Scheme 3. Catalytic asymmetric Mukaiyama aldol reaction.
Instead of (S)-BINOL, antipodal ( $R$ )-BINOL ( $6 \mathrm{~mol} \%$ ) was examined under identical conditions. Expectedly, the results differed with regard to the yield and diastereoselectivity [syn/anti $=50: 50,89 \%$ ee (syn), and $99 \%$ ee (anti) by HPLC analysis] (mismatching).

Pyrone formation and successive $O$-methylation using syn-3 according to the reported method [15] produced 4-methoxy-5,6-dihydro-2H-pyran-2-one precursor ( $1^{\prime} S, 6 S$ )-5 in $88 \%$ yield ( $\mathrm{dr}=91: 9$ ) in two steps (Scheme 4). Finally, Pd/C-catalyzed debenzylation of ( $1^{\prime} S, 6 S$ )-5 furnished (-)-pestalotin in 60\% yield and $99 \%$ ee (C-6 position) by HPLC analysis after recrystallization, together with a trace amount of (+)-epipestalotin.

Scheme 4. Synthesis of (-)-pestalotin.

### 2.4. Diastereoselective Mukaiyama Aldol Reactions Promoted by Achiral Lewis Acids

Several simpler achiral Lewis acids were screened for diastereoselective Mukaiyama aldol reactions (Table 1). Hagiwara's pioneering work addressed Lewis acid-mediated crossed-aldol reactions between 1 and 2 to afford syn-3 adducts [15]; $\mathrm{TiCl}_{4}(100 \mathrm{~mol} \%)$ produced excellent syn-3 diastereoselectivity, but the anti- 3 selectivity was insufficient when using several other Lewis acids $\left(\mathrm{BF}_{3} \bullet \mathrm{OEt}_{2}, \mathrm{Et}_{2} \mathrm{AlCl}\right.$, $\mathrm{ZnCl}_{2}$ ). Taking this information into account, we reinvestigated this procedure with the aim of enhancing stereocomplementary anti-3 selectivity. The salient features are as follows: (i) The amount of $\mathrm{TiCl}_{4}(100 \mathrm{~mol} \%)$ could be decreased to a catalytic amount ( $20 \mathrm{~mol} \%$ ), by which aldehyde 1 was sufficiently consumed (entries 1-3). (ii) Notably, the aldol-step reaction mixture was directly treated with PPTS/MeOH solution following the procedure mentioned described in Section 2.2 to furnish the desired 4-methoxy-5,6-dihydro-2H-pyran-2-one precursor ( $1^{\prime} S, 6 S$ )-5 smoothly with good syn-/antiselectivity and excellent enantioselectivity at the C6-position (entry 2). This one-pot furan formation is the first finding among previously reported total syntheses. (iii) The use of other strong Lewis acids such as $\mathrm{AlCl}_{3}, \mathrm{SnCl}_{4}$, and $\mathrm{BF}_{3} \bullet \mathrm{OEt}_{2}$, did not afford fruitful results (entries 4-6). (iv) Fortunately, the reaction using $\mathrm{ZrCl}_{4}$ switched the selectivity from syn- to anti- to afford ( $1^{\prime} S, 6 S$ )-5 as a major product with moderate diastereoselectivity but with excellent enantioselectivity (entry 8). (v) The use of mild metal triflate reagents such as $\mathrm{M}(\mathrm{OTf}) \mathrm{n}(\mathrm{M}=\mathrm{Sc}, \mathrm{La}, \mathrm{Cu})$ were examined next. In contrast to $\mathrm{TiCl}_{4}$ and $\mathrm{ZrCl}_{4}, \mathrm{Cu}(\mathrm{OTf})_{2}$ produced a satisfactory yield with excellent syn-3 selectivity and enantioselectivity (entry 11).

### 2.5. Catalytic Diastereoselective Hetero-Diels-Alder Reaction

Next, our attention was focused on a hetero-Diels-Alder reaction between aldehyde 1 and Brassard's siloxydiene (4) [11] to construct pyrone precursors ( $1^{\prime} S, 6 S$ )-5 and ( $1^{\prime} S, 6 R$ )-5 in a straightforward manner, basically according to Midland's protocol [12] (Scheme 2). The salient features are as follows: (i) Several Lewis acid catalysts $\left(\mathrm{TiCl}_{4}, \mathrm{AlCl}_{3}, \mathrm{SnCl}_{4}, \mathrm{BF}_{3} \bullet \mathrm{OEt}_{2}, \mathrm{ZnCl}_{2}\right.$, and $\mathrm{MgCl}_{2}$ ) were screened (Table 2). The reaction profile apparently differed from the result listed in Table 1; i.e., both the yield and stereoselectivities were moderate to low (entries 1-5). (ii) Among metal triflate catalysts $\mathrm{M}(\mathrm{OTf}) \mathrm{n}(\mathrm{M}=\mathrm{Sc}, \mathrm{La}, \mathrm{Cu})$, only $\mathrm{Sc}(\mathrm{OTf})_{3}$ afforded moderate result (entry 6), and, in contrast to our expectation $\mathrm{Cu}(\mathrm{OTf})_{2}$ afforded a disappointing result (entry 8). (iii) A reinvestigation of Midland's best conditions using "chiral" Eu(hfc) $)_{3}$ revealed good selectivity for ( $1^{\prime} S, 6 S$ )-5 (entry 9). (iv) Notably, the use of more inexpensive and accessible "achiral" Eu(fod) ${ }_{3}$ produced superior diastereoselectivity and enantioselectivity (entry 10).

According to Midland's report, stereocomplementary ( $1^{\prime} S, 6 R$ )-diastereoselective reaction using $\mathrm{Et}_{2} \mathrm{AlCl}$ catalyst was examined to obtain pyrone ( $1^{\prime} S, 6 R$ )-5 in our hands (Scheme 5). Due to the subtle reported conditions, the reaction was hardly reproducible, and our best result was addressed; the obtained crude product contained considerable amounts of aldol-type compound 9 with the desirable product ( $1^{\prime} S, 6 R$ )-5. Compound 9 was converted to ( $1^{\prime} S, 6 R$ )-5 by PPTS/toluene under reflux conditions, albeit in poor yield (12\%).

Scheme 5. (1'S,6R)-Diastereoselective hetero-Diels-Alder reaction using Brassard's siloxydiene.
Finally, debenzylation of $\left(1^{\prime} S, 6 S\right)-5$ and $\left(1^{\prime} S, 6 R\right)-5$ using the $\mathrm{H}_{2} / \mathrm{Pd}(\mathrm{OH})_{2}-\mathrm{C}$ catalyst produced $(-)$-pestalotin and (+)-epipestalotin, respectively, in good yield and with excellent optical purities (Scheme 6). Gratifyingly, Mitsunobu inversions of (-)-pestalotin and (+)-epipestalotin smoothly proceeded to furnish (+)-epipestalotin and (-)-pestalotin, respectively (Scheme 6). The present inversion step increases the value of the whole synthesis by a convergent process. Physical and spectral data (mp, optical rotation, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) of all four pestalotin diastereomers matched completely with Mori's reported data [9]. Additional ${ }^{13} \mathrm{C}$-NMR spectral data and HPLC measurements are described in the experimental and in the ESI, respectively. The present divergent methodology is superior compared with Mori's approach to the only reported total synthesis of all four pestalotin families [9] in the following respects: (i) common ( $R$ )-glycidol starting compound, (ii) short syntheses ( 7 and 9 steps), and (iii) higher total yield.

Scheme 6. Final stage of the total synthesis all four pestalotin diastereomers.

## 3. Materials and Methods

All reactions were carried out in oven-dried glassware under an argon atmosphere. Flash column chromatography was performed with silica gel 60 (230-400 mesh ASTM, Merck, Darmstadt, Germany). TLC analysis was performed on Merck 0.25 mm Silicagel $60 \mathrm{~F}_{254}$ plates. Melting points were determined on a hot stage microscope apparatus (ATM-01, AS ONE, Osaka, Japan) and were uncorrected. NMR spectra were recorded on a JEOLRESONANCE EXC-400 or ECX-500 spectrometer (JEOL, Akishima, Japan) operating at 400 MHz or 500 MHz for ${ }^{1} \mathrm{H}-\mathrm{NMR}$, and 100 MHz and 125 MHz for ${ }^{13} \mathrm{C}$ NMR. Chemical shifts ( $\delta \mathrm{ppm}$ ) in $\mathrm{CDCl}_{3}$ were reported downfield from TMS $(=0)$ for ${ }^{1} \mathrm{H}$-NMR. For ${ }^{13} \mathrm{C}$-NMR, chemical shifts were reported in the scale relative to $\mathrm{CDCl}_{3}(77.00 \mathrm{ppm})$ as an internal reference. Mass spectra were measured on a JMS-T100LC spectrometer (JEOL, Akishima, Japan). HPLC data were obtained on a SHIMADZU (Kyoto, Japan) HPLC system (consisting of the following: LC-20AT, CMB20A, CTO-20AC, and detector SPD-20A measured at 254 nm ) using Chiracel AD-H or Ad-3 column (Daicel, Himeji, Japan, 25 cm ) at $25^{\circ} \mathrm{C}$. Optical rotations were measured on a JASCO DIP-370 (Na lamp, 589 nm ).
(R)-2-((trityloxy)methyl)oxirane (6)
$\operatorname{TrCl}(15.3 \mathrm{~g}, 55 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(35 \mathrm{~mL})$ was added to a stirred solution of $(R)-(+)$-glycidol $(3.70 \mathrm{~g}, 50 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(13.9 \mathrm{~mL}, 100 \mathrm{mmol})$ and DMAP ( $61 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring at $20-25^{\circ} \mathrm{C}$ for 24 h . The mixture was quenched with sat. $\mathrm{NH}_{4} \mathrm{Cl}$ aq., which was extracted three times with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude solid was purified by recrystallization from $\mathrm{MeOH}(100 \mathrm{~mL})$ to give the desired product $6(13.1 \mathrm{~g}, 83 \%)$.

Colorless crystals, mp 99-100 ${ }^{\circ} \mathrm{C}$ [lit. (S)-1-(Trityloxy)hexan-2-ol (7)

1-Bromopropane ( $8.60 \mathrm{~mL}, 95 \mathrm{mmol}$ ) was gradually added to a stirred Mg granular ( 2.31 g , $95 \mathrm{mmol})$ and a small amounts of $\mathrm{I}_{2}$ in THF $(60 \mathrm{~mL})$ at $20-25^{\circ} \mathrm{C}$ under an Ar atmosphere, and the mixture was stirred for 0.5 h at $20-25^{\circ} \mathrm{C}$. $\mathrm{CuI}(143 \mathrm{mg}, 0.80 \mathrm{mmol})$ was added, the mixture was cooled down to $-40^{\circ} \mathrm{C}$ and $(S)$-oxirane $6(12.1 \mathrm{~g}, 38 \mathrm{mmol})$ in THF $(100 \mathrm{~mL})$ was added to the mixture at the same temperature, followed by stirring for 2 h . The mixture was quenched with sat. $\mathrm{NH}_{4} \mathrm{Cl}$ aq., which was extracted three times with AcOEt. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude product was purified by $\mathrm{SiO}_{2}-\mathrm{column}$ chromatography (hexane/ $\mathrm{AcOEt}=15 / 1$ ) to give the desired alcohol $7(12.7 \mathrm{~g}, 93 \%)$.

Pale yellow oil; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=0.86(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.16-1.46(\mathrm{~m}, 6 \mathrm{H}), 2.30(\mathrm{~d}$, $J=3.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{dd}, J=7.8 \mathrm{~Hz}, 9.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.18(\mathrm{dd}, J=3.2 \mathrm{~Hz}, 9.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.72-3.80(\mathrm{~m}, 1 \mathrm{H})$, $7.19-7.35(\mathrm{~m}, 10 \mathrm{H}), 7.40-7.47(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=13.9,22.6,27.6,33.0,67.7,70.9$, 86.6, 127.0 (3C), 127.8 (6C), 128.6 (6C), 143.8.

(S)-2-(Benzyloxy)hexan-1-ol (8) [15]

A mixture of benzyl bromide ( $4.85 \mathrm{~mL}, 41 \mathrm{mmol}$ ) and (S)-alcohol $7(12.4 \mathrm{~g}, 34 \mathrm{mmol})$ in DMF $(25 \mathrm{~mL})$ were added to a stirred suspension of $\mathrm{NaH}(60 \% ; 2.04 \mathrm{mg}, 51 \mathrm{mmol})$ in DMF $(10 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere. TBAI ( $126 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) was added to the mixture and the mixture was allowed to warm up to $20-25^{\circ} \mathrm{C}$, followed by stirring for 1 h . The mixture was quenched with MeOH and $\mathrm{K}_{2} \mathrm{CO}_{3}$, which was extracted three times with AcOEt. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil ( 15.6 g ) was used for the next step without purification.
$\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}(647 \mathrm{mg}, 3.4 \mathrm{mmol})$ was added to a solution of the oil $(15.6 \mathrm{~g})$ in $\mathrm{MeOH}(70 \mathrm{~mL})$ at $20-25^{\circ} \mathrm{C}$ under an Ar atmosphere, and the mixture was stirred for 1 h at the same temperature. The mixture was quenched with sat. $\mathrm{NaHCO}_{3}$ aq. and concentrated, which was extracted three times with AcOEt . The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude product was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/ $\mathrm{AcOEt}=15: 1-3: 1$ ) to give 8 ( $6.52 \mathrm{~g}, 92 \%$ for 2 steps, $>98 \%$ ee).

Yellow oil; $[\alpha]_{\mathrm{D}}^{24}+21.4\left(c 1.16, \mathrm{CHCl}_{3}\right)$ [lit. [15], $\left.[\alpha]_{\mathrm{D}}^{\text {unknown }}+22.3\left(c 1.13, \mathrm{CHCl}_{3}\right)\right] ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=0.90(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.23-1.40(\mathrm{~m}, 4 \mathrm{H}), 1.44-1.71(\mathrm{~m}, 2 \mathrm{H}), 1.93(\mathrm{brs}, 1 \mathrm{H})$, $3.47-3.58(\mathrm{~m}, 2 \mathrm{H}), 3.65-3.75(\mathrm{~m}, 1 \mathrm{H}), 4.54(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.63(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-7.39(\mathrm{~m}$, $5 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=13.8,22.6,27.3,30.3,63.9,71.3,79.7,127.4,127.6$ (2C), 128.2 (2C), 138.3. HPLC analysis (AD-H, flow rate $1.00 \mathrm{~mL} / \mathrm{min}$, solvent: hexane $/ 2-$ propanol $=30 / 1) \mathrm{t}_{\mathrm{R}}($ racemic $)=$ 9.33 min and $10.27 \mathrm{~min} . \mathrm{t}_{\mathrm{R}}[(S)$-form $]=8.95 \mathrm{~min}$.

(S)-2-(Benzyloxy)hexanal (1) [15]

TEMPO ( $106 \mathrm{mg}, 0.68 \mathrm{mmol})$ and $\mathrm{KBr}(407 \mathrm{mg}, 3.4 \mathrm{mmol})$ was added to a stirred solution of alcohol $8(7.08 \mathrm{~g}, 34 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(34 \mathrm{~mL})$ at $0-5{ }^{\circ} \mathrm{C}$ under an Ar atmosphere. A mixture of NaOCl aq. ( $1.5 \mathrm{M}, 34 \mathrm{~mL}, 51 \mathrm{mmol}$ ), $\mathrm{NaHCO}_{3}(6.7 \mathrm{~g}, 80 \mathrm{mmol})$, and $\mathrm{Na}_{2} \mathrm{CO}_{3}(318 \mathrm{mg}, 3 \mathrm{mmol})$ in water ( 220 mL ), was added to the solution at same temperature. The mixture was allowed to warm to $20-25^{\circ} \mathrm{C}$, followed by stirring at the same temperature for 1 h . The mixture was quenched with water, which was extracted twice with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil was purified by Florisil ${ }^{\circledR}$ column chromatography (hexane/ $\mathrm{AcOEt}=5: 1$ ) to give the desired product $1(6.04 \mathrm{~g}, 86 \%)$.

Yellow oil; $[\alpha]_{\mathrm{D}}^{24}-81.2\left(c \quad 1.08, \mathrm{CHCl}_{3}\right)\left[\right.$ lit. [15], $\left.[\alpha]_{\mathrm{D}}^{\text {unknown }}-86.1\left(c 0.98, \mathrm{CHCl}_{3}\right)\right] ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=0.90(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}), 1.24-1.49(\mathrm{~m}, 4 \mathrm{H}), 1.69(\mathrm{q}, J=6.9 \mathrm{~Hz}, 13.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.76$ $(\mathrm{t}, J=6.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.54(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.68(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 7,27-7.41(\mathrm{~m}, 5 \mathrm{H}), 9.66(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=13.7,22.3,26.7,29.6,72.3,83.3,127.8,127.9,128.4,137.3,203.6$.

An alternative method is following:
DMSO ( $4.26 \mathrm{~mL}, 60 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added slowly to a stirred solution of oxalyl dichloride ( $3.43 \mathrm{~mL}, 40 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(60 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ under an Ar atmosphere. After the mixture was stirred for $5 \mathrm{~min}, 8(4.22 \mathrm{~g}, 20 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added and the mixture was stirred for 0.5 h at the same temperature. $\mathrm{Et}_{3} \mathrm{~N}(16.6 \mathrm{~mL}, 120 \mathrm{mmol})$ was added to the mixture and the mixture was allowed to warm up to $0-5{ }^{\circ} \mathrm{C}$ over a period of 1 h , followed by stirring for 1 h at $0-5{ }^{\circ} \mathrm{C}$. The mixture was quenched with water, which was extracted three times with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phase was washed with a large amounts of water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude product was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/ $\mathrm{AcOEt}=25 / 1$ ) to give the desired product 1 ( $3.99 \mathrm{~g}, 97 \%$ ).

Methyl (5S,6S)-6-(benzyloxy)-5-hydroxy-3-oxodecanoate (syn-3) [15]
Preparation for Ti-BINOL solution: A suspension of $\mathrm{Ti}(\mathrm{OiPr})_{4}(2.9 \mathrm{mg}, 10 \mu \mathrm{~mol})$, and (S)-BINOL $(2.8 \mathrm{mg}, 10 \mu \mathrm{~mol})$ in THF $(0.4 \mathrm{~mL})$ was stirred stirred at $20-25^{\circ} \mathrm{C}$ under an Ar atmosphere for 1 h .

Asymmetric Mukaiyama aldol reaction: Ti-BINOL solution was added to a stirred suspension of aldehyde $\mathbf{1}(103 \mathrm{mg}, 0.50 \mathrm{mmol})$ and $\mathrm{LiCl}(0.85 \mathrm{mg}, 20 \mu \mathrm{~mol})$ in THF $(0.5 \mathrm{~mL})$ at $20-25^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring at the same temperature for 0.5 h . Chan's diene $2(260 \mathrm{mg}, 1.0 \mathrm{mmol})$ in THF ( 0.3 mL ) was added slowly to the mixture, which was stirred for 14 h . PPTS ( $25 \mathrm{mg}, 0.10 \mathrm{mmol}$ ) in $\mathrm{MeOH}(1.0 \mathrm{~mL})$ was added to the mixture, followed by stirring at the same temperature for 2 h . The resulting mixture was quenched with sat. $\mathrm{NaHCO}_{3}$ aq., which was extracted three times with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/ $\mathrm{AcOEt}=8 / 1$ ) to give the desired product syn-3 ( $85 \%$ ee, dr 93:7, $51 \mathrm{mg}, 31 \%$ ).

Pale yellow oil; $[\alpha]]_{\mathrm{D}}^{25}+1.0\left(c 1.0, \mathrm{CHCl}_{3}\right)\left[\right.$ lit. $\left.[15],[\alpha]_{\mathrm{D}}^{\text {unknown }}+1.2\left(c 1.00, \mathrm{CHCl}_{3}\right)\right] ; 85 \%$ ee; HPLC analysis (AD-3, flow rate $1.00 \mathrm{~mL} / \mathrm{min}$, solvent: hexane $/ 2$-propanol $=30: 1$ ) $\mathrm{t}_{\mathrm{R}}($ racemic $)=13.51 \mathrm{~min}$, $14.13 \mathrm{~min}, 18.89 \mathrm{~min}$ and $19.82 \mathrm{~min} . \mathrm{t}_{\mathrm{R}}[(5 S, 6 S)$-form $]=18.69 \mathrm{~min} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ $0.91(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.24-1.70(\mathrm{~m}, 6 \mathrm{H}), 2.62-2.64(\mathrm{~m}, 1 \mathrm{H}), 2.71-2.74(\mathrm{~m}, 1 \mathrm{H}), 3.34-3.37(\mathrm{~m}, 1 \mathrm{H}), 3.477$ $(\mathrm{s}, 1 \mathrm{H}), 3.480(\mathrm{~s}, 1 \mathrm{H}), 3.73(\mathrm{~s}, 3 \mathrm{H}), 4.13-4.18(\mathrm{~m}, 1 \mathrm{H}), 4.49(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.63(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H})$, $7.28-7.37(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=14.0,22.8,27.6,29.3,46.0,49.6,52.3,68.3,72.2,80.8$, 127.8, 127.9, 128.4, 138.2, 167.4, 202.7.

(E)-((1,3-dimethoxybuta-1,3-dien-1-yl)oxy)trimethylsilane (4) (Brassard's diene)

Concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(0.27 \mathrm{~mL}, 5.0 \mathrm{mmol})$ was added to a stirred mixture of methyl acetoacetate $(11.6 \mathrm{~g}, 100 \mathrm{mmol})$ and trimethyl orthoformate $(26.5 \mathrm{~g}, 250 \mathrm{mmol})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring at $20-25^{\circ} \mathrm{C}$ for $24 \mathrm{~h} . \mathrm{K}_{2} \mathrm{CO}_{3}(5.0 \mathrm{~g})$ was added to the mixture, which was filtered through a glass filter. The filtrate was concentrated under reduced pressure. The obtained crude oil was purified by distillation (bp $72-75^{\circ} \mathrm{C} / 3.2 \mathrm{kPa}$ ) to give the desired ( $E$ )-methyl-3-methoxybut-2-enoate (9.08 g, 70\%).
$n \mathrm{BuLi}(1.63 \mathrm{M}$ in hexane, $13.6 \mathrm{~mL}, 22 \mathrm{mmol})$ was added to stirred solution of $i \mathrm{Pr}_{2} \mathrm{NH}(3.11 \mathrm{~mL}$, $22 \mathrm{mmol})$ in THF $(10 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring for 10 min . The mixture was cooled down to $-78^{\circ} \mathrm{C}$ and (E)-methyl-3-methoxybut-2-enoate ( $2.22 \mathrm{~g}, 17 \mathrm{mmol}$ ) in THF $(4.0 \mathrm{~mL})$ was added to the mixture, followed by stirring at the same temperature for 0.5 h . TMSCl $(2.58 \mathrm{~mL}, 20 \mathrm{mmol})$ in THF $(3.0 \mathrm{~mL})$ was added to the mixture at the same temperature and the mixture was allowed to warm up to $0-5^{\circ} \mathrm{C}$ over a period of 1 h . The mixture was concentrated and filtered through Celite ${ }^{\circledR}$ (No.503) using a glass filter, and washing with hexane ( $10 \mathrm{~mL} \times 3$ ). The filtrate was concentrated under reduced pressure and the obtained crude oil was purified by distillation to give the desired product $4(2.62 \mathrm{~g}, 76 \%)$.

Colorless oil; bp $40-43{ }^{\circ} \mathrm{C} / 50 \mathrm{~Pa} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=0.26(\mathrm{~s}, 9 \mathrm{H}), 3.56(\mathrm{~s}, 3 \mathrm{H}), 3.57(\mathrm{~s}$, $3 \mathrm{H}), 3.99(\mathrm{t}, J=1.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.03(\mathrm{~d}, J=1.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.34(\mathrm{~d}, J=1.8,1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $=0.3,54.0,55.0,75.5,78.6,158.7$

(S)-6-[(S)-1-(Benzyloxy)pentyl]-4-methoxy-5,6-dihydro-2H-pyran-2-one [(1'S,6S)-5] [15]
(1) $1 \mathrm{M}-\mathrm{KOH}$ aq. ( 0.37 mL ) was added to a stirred solution of $(5 S, 6 S)$-aldol adduct syn- $\mathbf{3}$ ( 108 mg , $0.33 \mathrm{mmol})$ in $\mathrm{MeOH}(0.37 \mathrm{~mL})$ at $20-25^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring at the same temperature for 3 h . The mixture was quenched with $1 \mathrm{M}-\mathrm{HCl}$ aq., which was extracted twice with AcOEt. The combined organic phase was washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil was purified by $\mathrm{SiO}_{2}$-gel column chromatography (hexane/ $\mathrm{AcOEt}=5 / 1-2 / 1$ ) to give the desired 4-hydroxy-5,6-dihydro-2H-pyran-2-one precursor (dr 93:7, $94 \mathrm{mg}, 98 \%$ ).
${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=0.92(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.28-1.40(\mathrm{~m}, 4 \mathrm{H}), 1.71-1.77(\mathrm{~m}, 2 \mathrm{H})$, $2.58(\mathrm{dd}, J=5.2 \mathrm{~Hz}, 17.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.76(\mathrm{dd}, J=5.2 \mathrm{~Hz}, 17.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.30(\mathrm{~d}, J=20.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.41(\mathrm{~d}$, $J=20.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.42-3.45(\mathrm{~m}, 1 \mathrm{H}), 4.44(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.59(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.71-4.74(\mathrm{~m}$, $1 \mathrm{H}), 7.26-7.37(\mathrm{~m}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=13.9,22.7,27.5,29.3,40.6,46.2,72.3,75.9,80.0$, 128.1, 128.2, 128.5, 136.9, 167.7, 199.4
$\mathrm{K}_{2} \mathrm{CO}_{3}(80 \mathrm{mg}, 0.58 \mathrm{mmol})$ was added to a stirred suspension of the precursor ( $85 \mathrm{mg}, 029 \mathrm{mmol}$ ) and $\mathrm{Me}_{2} \mathrm{SO}_{4}(55 \mathrm{mg}, 0.44 \mathrm{mmol})$ in acetone $(1.5 \mathrm{~mL})$ at $20-25^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by
stirring at the same temperature for 14 h . The mixture was quenched with water, which was extracted three times with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phase was washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil was purified by $\mathrm{SiO}_{2}$-gel column chromatography (hexane/AcOEt $=6 / 1-4 / 1)$ to give the desired product ( $1^{\prime} S, 6 S$ )-5 (dr 91:9, $79 \mathrm{mg}, 89 \%$ ).

Pale yellow oil; $\left.[\alpha]_{\mathrm{D}}^{25}-93.7\left(c ~ 0.72, \mathrm{CHCl}_{3}\right)\right]$. [lit. [15], $\left.[\alpha]_{\mathrm{D}}^{\text {unknown }}-99.1\left(c 0.93, \mathrm{CHCl}_{3}\right)\right]$.
(2) $\mathrm{TiCl}_{4}(0.02 \mathrm{~mL}, 0.2 \mathrm{mmol})$ was added to a solution of aldehyde $\mathbf{1}(206 \mathrm{mg}, 1.0 \mathrm{~m} \mathrm{~mol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(3.0 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring at the same temperature for 10 min . Chan's diene ( $61 \%$ purity, $520 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) was added to the mixture, which was stirred at $0-5^{\circ} \mathrm{C}$ for 5 min and at $20-25^{\circ} \mathrm{C}$ for 1 h . $\mathrm{MeOH}(2 \mathrm{~mL})$ and PPTS ( $125 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) was successively added to the mixture, followed by stirring at the same temperature for 2 h . The mixture was quenched with sat. $\mathrm{NaHCO}_{3}$ aq., which was filtered through Celite ${ }^{\circledR}$. The filtrate was extracted twice with AcOEt, and the combined organic phase was washed with water, brine dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/ $\mathrm{AcOEt}=4: 1$ ) to give the desired product ( $1^{\prime} S, 6 S$ )-5 [165 mg, $\left.49 \%, 91 \% \mathrm{ee}, \mathrm{dr}=87: 13\right]$.
(3) Aldehyde $1(413 \mathrm{mg}, 2.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ was added to a stirred suspension of $\mathrm{Eu}(\mathrm{fod})_{3}(104 \mathrm{mg}, 0.1 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere, followed by stirring at the same temperature for 5 min . Brassard's diene $4(607 \mathrm{mg}, 3.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ was added to the mixture at the same temperature, followed by stirring for 2 h . The mixture was quenched with water, which was extracted three times with AcOEt. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude product was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/ $\mathrm{AcOEt}=3 / 1$ ) to give the desired product $\left[\left(1^{\prime} S, 6 S\right)-5\right](370 \mathrm{mg}$, $67 \%,>98 \%$ ee $, \mathrm{dr}=98: 2$ ). HPLC analysis (AD-3, flow rate $1.00 \mathrm{~mL} / \mathrm{min}$, solvent: hexane/2-propanol $=30: 1) \mathrm{t}_{\mathrm{R}}($ racemic $)=23.25 \mathrm{~min}$ and $24.77 \mathrm{~min} . \mathrm{t}_{\mathrm{R}}[(1 S, 6 S)-$ form $]=25.53 \mathrm{~min} . ;{ }^{1} \mathrm{H}-\mathrm{NMR}(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=0.89(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.25-1.72(\mathrm{~m}, 6 \mathrm{H}), 2.26(\mathrm{dd}, J=4.0 \mathrm{~Hz}, 17.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.70$ (ddd, $J=1.7 \mathrm{~Hz}, 13.2 \mathrm{~Hz}, 17.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.58-3.61(\mathrm{~m}, 1 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}), 4.52(\mathrm{dt}, J=4.0 \mathrm{~Hz}, 13.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.62$ $(\mathrm{d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.66(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.13(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-7.36(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=14.0,22.7,27.9,28.4,29.3,56.1,72.9,76.3,79.0,90.2,127.8,127.9,128.4,138.1$, 167.0, 173.3.

(-)-Pestalotin; (S)-6-[(S)-1-Hydroxypentyl]-4-methoxy-5,6-dihydro-2H-pyran-2-one [9]
A suspension of benzyl ether $[(1 S, 6 S)-5](448 \mathrm{mg}, 1.5 \mathrm{mmol})$ and $20 \% \mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(53 \mathrm{mg}, 0.08 \mathrm{mmol})$ in AcOEt ( 15 mL ), equipped with a $\mathrm{H}_{2}$ balloon, was stirred at $20-25^{\circ} \mathrm{C}$ for 1 h . The mixture was filtered through Celite ${ }^{\circledR}$ (No.503) using glass filter and the filtrate was concentrated under reduced pressure. The obtained crude solid ( 384 mg ) was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/AcOEt $=$ 3:2) to give the desired (-)-pestalotin ( $283 \mathrm{mg}, 88 \%,>98 \%$ ee, $\mathrm{dr}=>98: 2$ ).

Colorless crystals; mp $84-86^{\circ} \mathrm{C}\left(\right.$ lit. [9], $\left.85.8-86.0^{\circ} \mathrm{C}\right)$; $[\alpha]_{\mathrm{D}}^{25}-91.9(c 0.44, \mathrm{MeOH})$ [lit. (R)-6-[(S)-1-(Benzyloxy)pentyl]-4-methoxy-5,6-dihydro-2H-pyran-2-one [(1'S,6R)-5]
(1) Aldehyde $1(206 \mathrm{mg}, 1.0 \mathrm{mmol})$ was added to a stirred suspension of $\mathrm{ZrCl}_{4}(47 \mathrm{mg}, 0.2 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.9 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$ under an Ar atmosphere. After 10 min , Chan's diene (ca. $60 \%$ purity; $520 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) was added to the mixture, which was allowed to warm up to $20-25^{\circ} \mathrm{C}$, followed by stirring for 1 h . $\mathrm{MeOH}(2.0 \mathrm{~mL})$ and PPTS $(125 \mathrm{mg} 0.5 \mathrm{mmol})$ was successively added to the solution, followed by stirring at $40-45{ }^{\circ} \mathrm{C}$ for 14 h . Sat. $\mathrm{NaHCO}_{3}$ aq. solution was added to the mixture, which was filtered through Cerite ${ }^{\circledR}$. The filtrate was extracted twice with AcOEt, and the combined organic phase was washed with water, brine dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude oil was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/AcOEt $=4: 1$ ) to give the desired product $\left(1^{\prime} S, 6 R\right)-5$ ( $126 \mathrm{mg}, 41 \%,>98 \%$ ee, $\mathrm{dr}=35: 65$ ).

Colorless oil. HPLC analysis (AD-3, flow rate $1.00 \mathrm{~mL} / \mathrm{min}$, solvent: hexane $/ 2$-propanol $=30: 1$ ) $\mathrm{t}_{\mathrm{R}}($ racemic $)=17.72 \mathrm{~min}$ and $19.60 \mathrm{~min} . \mathrm{t}_{\mathrm{R}}[(1 S, 6 R)$-form $]=18.10 \mathrm{~min} . ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $=0.89(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.29-1.64(\mathrm{~m}, 6 \mathrm{H}), 2.35(\mathrm{dd}, J=4.0 \mathrm{~Hz}, 17.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.81(\mathrm{ddd}, J=1.7 \mathrm{~Hz}$, $12.6 \mathrm{~Hz}, 17.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}), 3.73-3.78(\mathrm{~m}, 1 \mathrm{H}), 4.39(\mathrm{dt}, J=4.0,12.6,1 \mathrm{H}), 4.63(\mathrm{~d}, J=11.5,1 \mathrm{H})$, $4.74(\mathrm{~d}, J=11.5,1 \mathrm{H}), 5.14(\mathrm{~d}, J=1.7,1 \mathrm{H}), 7.28-7.35(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=13.9$, $22.6,27.4,27.9,30.7,56.0,73.3,78.4,79.1,90.0,127.6,127.8,128.3,138.3,167.0,173.4$.
(2) $\mathrm{Et}_{2} \mathrm{AlCl}(1.0 \mathrm{M}, 0.6 \mathrm{~mL}, 0.6 \mathrm{mmol})$ was added to a stirred solution of aldehyde $\mathbf{1}(103 \mathrm{mg}$, $0.5 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ under an Ar atmosphere. After 5 min , diene $4(202 \mathrm{mg}$, $0.6 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{~mL})$ was added to the mixture, which was stirred for 14 h at the same temperature. The mixture was allowed to warm up to $-30^{\circ} \mathrm{C}$, followed by stirring for 14 h . The mixture was quenched by MeOH , which was extracted three times with AcOEt. The combined organic phase was washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude product was purified by $\mathrm{SiO}_{2}$-column chromatography (hexane $/ \mathrm{AcOEt}=5 / 1$ ) to give a mixture of aldol adduct 9 and ( $1^{\prime} S, 6 R$ )-5 ( $45: 55,48 \mathrm{mg}, 30 \%$ ). The mixture ( 48 mg ) and PPTS ( $2 \mathrm{mg}, 0.007 \mathrm{mmol}$ ) in toluene $(1.4 \mathrm{~mL})$, was added at $80-85^{\circ} \mathrm{C}$ for 1 h under an Ar atmosphere. After cooling to room temperature, water was added to the mixture, which was extracted twice with AcOEt. The combined organic phase was washed with water and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated. The obtained crude solid purified by $\mathrm{SiO}_{2}$-column chromatography (hexane/AcOEt $=5 / 1$ ) to give the desired product $\left(1^{\prime} S, 6 R\right)-5$ ( 23 mg , 2 steps $15 \%$, ca. $30 \%$ of ( $1^{\prime} S, 6 S$ )- 5 was contained).

(+)-Epipestalotin; (R)-6-[(S)-1-Hydroxypentyl]-4-methoxy-5,6-dihydro-2H-pyran-2-one [9]
A suspension of benzyl ether $[(1 S, 6 R)-5](365 \mathrm{mg}, 1.2 \mathrm{mmol})$ and $20 \% \mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(42 \mathrm{mg}, 0.06 \mathrm{mmol})$ in AcOEt ( 12 mL ), equipped with a $\mathrm{H}_{2}$ balloon, was stirred stirred at $20-25^{\circ} \mathrm{C}$ for 1 h . The mixture was filtered through Celite ${ }^{\circledR}$ (No.503) using glass filter and the filtrate was concentrated under reduced pressure. The obtained crude solid was purified $\mathrm{SiO}_{2}-$ column chromatography (hexane/ $\mathrm{AcOEt}=3 / 2$ ) to give the desired (+)-epipestalotin ( $187 \mathrm{mg}, 71 \%,>98 \%$ ee, $\mathrm{dr}=98: 2$ ).

Colorless crystals; mp $92-94{ }^{\circ} \mathrm{C}$ (lit. ## 4. Conclusions

We achieved an asymmetric total synthesis of all four chiral pestalotin diastereomers using common and commercially-available ( $R$ )-glycidol as the starting compound. The present synthesis involves a couple of divergent strategies, including syn- and anti-selective Mukaiyama aldol additions and hetero-Diels-Alder reactions.

Catalytic asymmetric Mukaiyama aldol reactions of readily-available bis(TMSO)diene (Chan's diene) with (S)-2-benzyloxyhexanal derived from (R)-glycidol afforded a syn-aldol adduct with high diastereoselectivity and enantioselectivity. Diastereoselective Mukaiyama aldol reactions mediated by catalytic achiral Lewis acids directly produced not only a ( $1^{\prime} S, 6 S$ )-pyrone precursor via the syn-aldol adduct using $\mathrm{TiCl}_{4}$, but also ( $1^{\prime} S, 6 R$ )-pyrone precursor derived from an antialdol adduct using $\mathrm{ZrCl}_{4}$ in a stereocomplementary manner.

A hetero-Diels-Alder reaction of similarly available mono(TMSO)diene (Brassard's diene) with (S)-2-benzyloxyhexanal produced the ( $1^{\prime} S, 6 S$ )-pyrone precursor promoted by $\mathrm{Eu}(\mathrm{fod})_{3}$ and the $\left(1^{\prime} S, 6 R\right)$-pyrone precursor $E t \mathrm{AlCl}_{2}$.

Debenzylation of $\left(1^{\prime} S, 6 S\right)$-and $\left(1^{\prime} S, 6 R\right)$-precursors furnished natural (-)(-)-pestalotin and unnatural (+)-epipestalotin, respectively. The unnatural (+)-pestalotin and (-)-epipestalotin were successfully synthesized by Mitsunobu inversion of ( - )-pestalotin and (+)-epipestalotin, respectively, in a divergent manner. All four chiral pestalotin diastereomers obtained possessed high chemical and optical purities (optical rotations, ${ }^{1} \mathrm{H}-\mathrm{NMR},{ }^{13} \mathrm{C}-\mathrm{NMR}$, and HPLC measurements).

The present divergent method affords concise access to asymmetric syntheses directed for these types of compounds with consecutive chiral dihydroxy groups, and is useful for accessible asymmetric Mukaiyama aldol reactions and relevant hetero-Diels-Alder reactions.

Copies of the ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$-NMR spectra for compounds syn-3, (1'S,6S)-5, (-)-pestalotin, ( $\left.1^{\prime} S, 6 R\right)-5$, $(+)$-epipestalotin are available in the Supplementary Information. Copies of the HPLC chromatogram of $( \pm)-8,(S)-8,( \pm)-3$, syn-3, $( \pm)-5,\left(1^{\prime} \mathrm{S}, 6 \mathrm{~S}\right)-5,\left(1^{\prime} \mathrm{S}, 6 \mathrm{R}\right)-5,( \pm)$-pestalotin, $(+)$-pestalotin, $(-)$-pestalotin, $( \pm)$-epipestalotin, ( + )-epipestalotin, and ( - -epipestalotin are available in the Supplementary Information.

Supplementary Materials: The following are available online. Supplementary 1: ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra for compounds syn-3, ( $\left.1^{\prime} S, 6 S\right)-5,(-)$-pestalotin, $\left(1^{\prime} S, 6 R\right)-5,(+)$-epipestalotin, Supplementary 2: HPLC chromatogram of $( \pm)-8,(S)-8,( \pm)-3, \operatorname{syn}-3,( \pm)-5,\left(1^{\prime} S, 6 S\right)-5,\left(1^{\prime} S, 6 R\right)-5,( \pm)$-pestalotin, (+)-pestalotin, (-)-pestalotin, ( $\pm$ )-epipestalotin, $(+)$-epipestalotin, and ( - -epipestalotin.

Author Contributions: M.M., K.N., and T.F. contributed the majority of experiments. Y.T. conceived and designed the project, and prepared the whole manuscript. All authors have read and agreed to the published version of the manuscript.
Funding: This research was partially supported by Grant-in-Aids for Scientific Research on Basic Area (B) "18350056", Basic Areas (C) 15K05508, and Priority Areas (A) "17035087" and "18037068", and Exploratory Research "17655045" from the Ministry of Education, Culture, Sports, Science and Technology (MEXT).

Acknowledgments: We thank Momoyo Kawamoto and Daiki Ueura in our laboratory for their help of some experiments.
Conflicts of Interest: The authors declare no conflict of interest.
Dedication: This article is dedicated to the late professor Teruaki Mukaiyama who deceased in 2018 and the late professor Kenji Mori who deceased in 2019. One of the authors (Y.T) offer his warmest congratulations to Professor Ben L. Feringa (University of Groningen, The Netherlands) on being awarded the 2016 Nobel Prize in Chemistry.
