Edited by H. Stoeckli-Evans, University of Neuchâtel, Switzerland

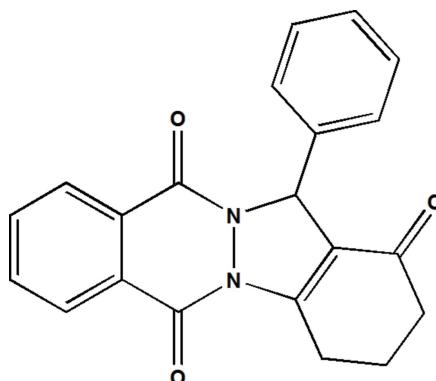

The title compound, $C_{21}H_{16}N_2O_3$, consists of an indazolone moiety, bearing a phenyl group, fused to a phthalazine ring system (r.m.s. deviation = 0.018 Å). The phenyl ring is almost normal to the mean plane of the five-membered ring of the indazolone moiety, making a dihedral angle of 89.64 (7)°. The six-membered ring of the indazolone moiety has an envelope conformation, with the central methylene C atom as the flap. In the crystal, molecules are linked via C—H···O hydrogen bonds, forming slabs parallel to the *bc* plane. The slabs are linked via C—H···π and π—π interactions [the shortest inter-centroid distance involving rings of pyrazolophthalazine moieties is 3.6430 (8) Å], forming a three-dimensional structure.

Keywords: crystal structure; indazolo; phthalazine-trione; C—H···O hydrogen bonds; π—π interactions.

Crystal structure of 13-phenyl-2,3,4,13-tetrahydro-1*H*-indazolo[1,2-*b*]phthalazine-1,6,11-trione

Esma Lamera, Saida Benzerka, Abdelmalek Bouraiou, Sofiane Bouacida, Hocine Merazig, Aissa Chibani, Marc Le Borgne and Zouhair Bouaziz

S1. Comments

Phthalazine derivatives have been reported to act as anticonvulsants (Carling *et al.* 2004), potential inhibitors of serotonin reuptake (Cashman & Ghirmai, 2009), anti-proliferative agents against different human and murine tumor cells (Hall *et al.*, 1992, 2001) and vasorelaxant agents (Nomoto *et al.* 1990). Therefore, a number of synthetic methods have been developed in recent years to uncover a variety of new reagents for the synthesis of phthalazine derivatives (Mosaddegh & Hassankhani, 2011; Hasaninejad *et al.*, 2012; Keshipour *et al.*, 2012). In previous work, we have reported the synthesis and structure heterocyclic compounds bearing a phthalazine unit (Bouraiou *et al.*, 2015). Herein, we describe the synthesis and crystal structure of the title indazolo phthalazine-trione derivative, resulting from the reaction of phthalhydrazide, cyclohexa-1,3-dione and benzaldehyde in the presence of catalytic amounts of sulfuric acid.

The title compound, Fig. 1, consists of an indazolone moiety, bearing a phenyl group, fused to a phthalazine ring system [r.m.s. deviation = 0.018 Å]. The phenyl ring (C16—C21) is almost normal to the mean plane of the five-membered ring (N1/N2/C9/C10/C15) of the indazolone moiety with a dihedral angle of 89.64 (7)°. The six-membered ring of the indazolone moiety (C10—C15) has an envelope conformation with the central methylene C atom, C13, as the flap.

In the crystal, molecules are linked *via* C—H···O hydrogen bonds forming slabs parallel to the *bc* plane (Table 1 and Fig. 2). The slabs are linked *via* C—H···π (Table 1) and slipped parallel π···π interactions [the shortest inter-centroid distance involves $Cg2\cdots Cg3^i = 3.6430(8)$ Å; $Cg2$ and $Cg3$ are the centroids of rings (N1/N2/C1/C2/C7/C8) and (C2—C7), respectively; inter-planar distance = 3.457 (5); slippage = 1.07 Å; symmetry code: (i) $-x + 1, -y, -z$], forming a three-dimensional structure.

S2. Synthesis and crystallization

The title compound was synthesized in accordance with established methods (Khurana & Magoo, 2009; Bouraiou *et al.*, 2015). Spectroscopic results and physical properties are in agreement with literature reports (Nagarapu *et al.*, 2009). The solid obtained, was recrystallized in a hot CHCl₃/EtOAc/EtOH (1:1:1) mixture giving yellow crystals of the title compound. MS (ES-API): m/z [M+H]⁺ = 345.1; ¹H-NMR δ (p.p.m.) (250 MHz, CDCl₃): 8.35–8.23 (m, 2H), 7.88–7.84 (m, 2H), 7.32–7.30 (m, 5H), 6.46 (s, 1H), 3.63–3.30 (m, 2H), 2.51–2.46 (m, 2H), 2.32–2.22 (m, 2H); ¹³C-NMR δ (p.p.m.) (62.9 MHz, ₃): 192.6, 156.1, 154.3, 152.3, 136.4, 134.6, 133.6, 129.1, 129.0, 128.7, 128.0, 127.8, 127.2, 119.7, 65.0, 37.0, 24.6, 22.3.

S3. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The H atoms were located in difference Fourier maps but introduced in calculated positions and refined as riding atoms: C—H = 0.93–0.98 Å with

$U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

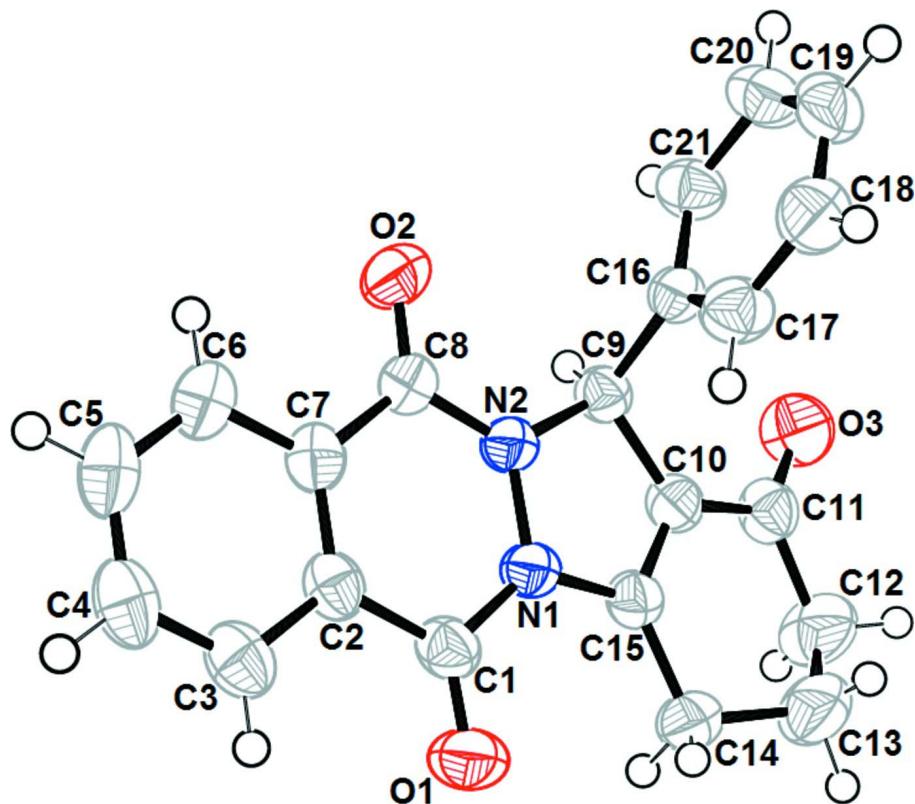

Figure 1

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg3 is the centroid of the C2—C7 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C5—H5···O2 ⁱ	0.93	2.59	3.488 (2)	163

C9—H9···O3 ⁱⁱ	0.98	2.54	3.501 (2)	165
C18—H18···Cg3 ⁱⁱⁱ	0.93	2.68	3.552 (2)	156

Symmetry codes: (i) $-x+1, y-1/2, -z+1/2$; (ii) $-x+1, -y+1, -z$; (iii) $-x+2, y+1/2, -z+1/2$.
