Received 30 October 2012; accepted 18 January 2013
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.033 ; w R$ factor $=0.118 ;$ data-to-parameter ratio $=15.0$.

The title molecule, $\mathrm{C}_{19} \mathrm{H}_{12} \mathrm{~S}_{2} \mathrm{O}_{2}$, lies on a twofold rotation axis. The thiochromonone unit is essentially planar, with a maximum deviation of 0.0491 (14) $\AA$. The dihedral angle between the thiochromenone ring systems is 64.48 (4) ${ }^{\circ}$. In the crystal, there are weak $\pi-\pi$ stacking interactions, with a centroid-centroid distance of 3.7147 (9) $\AA$.

## Comment

Bis-chromonones linked at position 3 are biologically important motifs (Santhosh \& Balasubramanian, 1991; Panja, et al., 2009). Analogues of these compounds prepared by replacing the oxygen atom in the heterocyclic core with sulfur are considered to be chemically inportant. Herein, we report the structure determination of the title compound (I).
The molecular structure of (I) is shown in Fig. 1. The molecule lies on a twofold rotation axis. The unique thiochromonone unit is essentially planar with a maximum deviation of 0.0491 (14) $\AA$ for atom C6. The planarity of this unit can be attributed to the $\mathrm{sp}^{2}$ hybridized nature of the aromatic benzene unit and the fused olefinic thiopyranone unit. This is similar to the case of a methylene bridged chromenone example found in the literature (Ambartsumyan et al., 2012). The dihedral angle between the two thiochromenone ring systems is $64.48(4)^{\circ}$. The torsion angles about the methylene carbon C 10 are 93.05 (13) $\AA$ for $\mathrm{C} 8-\mathrm{C} 7-\mathrm{C} 10-\mathrm{C} 7^{\mathrm{i}}$ (symmetry code: (i) $-\mathrm{x}+1, \mathrm{y},-\mathrm{z}+1 / 2$ ) and -87.80 (11) $\AA$ for C6-C7 $-\mathrm{C} 10-\mathrm{C} 7^{\mathrm{i}}$. The angle subtended at the bridging methylene carbon C 10 by the olefinic carbons $\left[\mathrm{C} 7-\mathrm{C} 10-\mathrm{C} 7^{\mathrm{i}}=\right.$ $\left.113.66(17)^{\circ}\right]$ and the olefinic bond length $[\mathrm{C} 7-\mathrm{C} 8=1.344(2) \AA$ ] are close to the respective values in known chromanone systems (Ambartsumyan et al., 2012). Examaples of thiochromone structures already appear in the literature (Nyburg et al., 1986; Li et al., 2010). In the crystal, there are weak $\pi-\pi$ stacking interactions (Fig .2) with $\mathrm{Cg} 1 \cdots \mathrm{Cg} 2^{\mathrm{ii}}=$ 3.7147 (9) $\AA$ where Cg 1 and cg2 are the centroids of the $\mathrm{S} 1 / \mathrm{C} 8 / \mathrm{C} 7 / \mathrm{C} 6 / \mathrm{C} 5 / \mathrm{C} 9$ and $\mathrm{C} 1-\mathrm{C} 5 / \mathrm{C} 9$ rings (symmetry code: (ii) $3 / 2-x, 1 / 2-y,-z)$.

## Experimental

To a stirred solution of 4-chloro-2H-thiochromene-3-carbaldehyde ( $0.5 \mathrm{~g}, 0.0025 \mathrm{~mol}$ ) in freshly dried DMSO ( 6.0 mL ) was added dried potassium fluoride $(0.3 \mathrm{~g}, 0.005 \mathrm{~mol})$ and then heated to $343-353 \mathrm{~K}$. After completion of the reaction by TLC, the reaction mass was cooled to $303-308 \mathrm{~K}$ and then quenched with 50 ml of water. The mixture was extracted with ethyl acetate ( $2 \times 30 \mathrm{ml}$ ). The combined organic portion was washed with water ( $2 \times 25 \mathrm{~mL}$ ) , dried over anhydrous sodium sulphate and then concentrated under reduced pressure to yield a brown paste. Purification of the crude product by column chromatography yielded the title bis methylene chromanone. 50 mg of the title compound was dissolved in 2 ml of methanol, and warmed to 323 K for complete dissolution, then filtered, and the clear solution was stored at room temperature. After 2 days, pale yellow crystals were formed.

## Refinement

H atoms bonded to $\mathrm{sp}^{2} \mathrm{C}$ atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $\mathrm{U}_{\mathrm{iso}}(\mathrm{H})=1.2 \mathrm{U}_{\mathrm{eq}}(\mathrm{C})$. The unique H atom conded to C 10 was refined independently with an isotropic displacement factor.

## Computing details

Data collection: SMART (Bruker, 2007); cell refinement: SAINT (Bruker, 2007); data reduction: SAINT (Bruker, 2007); program(s) used to solve structure: SHELXS97 (Sheldrick, 2008); program(s) used to refine structure: SHELXL97
(Sheldrick, 2008); molecular graphics: PLATON (Spek, 2009) and Jmol (Hanson, 2010); software used to prepare material for publication: SHELXTL (Sheldrick, 2008).

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
