### ABSTRACT

The data presented here are the biochemical parameters of 156 patients with hyperphenylalaninemia. PKU patients, who, in order to maintain optimal serum Phe concentrations, receive dietary treatment consisting of a diet low in natural protein supplemented with special low protein foods and a Phe-free amino acid mixture, vitamins and minerals. The obtained data reflects a high percentage of patients with prealbumin and selenium deficiencies, as well as an increased level of folic acid. This data article is related to the research article entitled, "Vitamin and mineral status in patients with hyperphenylalaninemia", by Crujeiras et al. [1].

## Specifications Table

---

Subject area	<i>Metabolic diseases</i>
More specific subject area	<i>Vitamins and minerals in phenylketonuria</i>
Type of data	<i>Table</i>
How data was acquired	<i>By clinical history</i>
Data format	<i>Analyzed data</i>
Experimental factors	<i>None applied</i>
Experimental features	-Tandem mass-spectrometry and standard procedures of laboratory
Data source location	PKU patients from three Spanish Centers: Hospital Universitario La Fe-Valencia, Hospital Universitario de Cruces-Basque Country and Hospital Clínico Universitario de Santiago-Galicia.
Data accessibility	Data is supplied in this article

---

## Value of the data

---

- A high percentage of selenium deficits as well as a high percentage of folic acid overloads are detected in PKU patients treated, which should lead us to reflect on whether to adjust international standards supplements formulated milks.
- 

## 1. Data, experimental design, materials and methods

The population comprised PKU patients from three Spanish Centers: Hospital Universitario La Fe-Valencia, Hospital Universitario de Cruces-Basque Country and Hospital Clínico Universitario de Santiago-Galicia. Patients were followed in their center from diagnosis to date. We included both patients diagnosed by newborn screening as well as those diagnosed later. Those who underwent sporadic monitoring were excluded, as well as those cases in which informed consent was not signed by parents and/or patients.

The variables collected for each patient were: age, sex, phenotype (mild hyper-Phe (MHPA) 120–360 µmol/L; mild-moderate PKU 360–1200 µmol/L (MPKU); classic PKU > 1200 µmol/L (CPKU) (according to US Guidelines [2], disease detection (early and late diagnosis), annual median blood Phe levels (target blood Phe levels considered adequate for children under 6 years of age were < 360 µmol/L; < 480 µmol/L between 6 and 10 years and ≤ 600 µmol/L in older patients), anthropometric measurements (weight, height and BMI), phenylalanine tolerance and BH4 treatment in the BH4 responsive patients; blood chemistry (total protein, prealbumin, electrolytes, selenium (Se), zinc (Zn), B<sub>12</sub>, folic acid, ferritin, 25-hydroxy vitamin D (25-OHD).

Micronutrients levels evaluated present the following reference intervals (valid for any patient age): Total protein: 6.3–8.5 g/dL; calcium (Ca): 8.7–10.8 mg/dL; phosphorus (P): 2.6–5.9 mg/dL; prealbumin: 21–41 mg/dL; vitamin B<sub>12</sub>: 180–1900 pg/mL; folic acid: 3–17.5 ng/mL; 25-OHD: 20–42 ng/mL; ferritin: 14–325 ng/mL; Zn: 65–140 µg/dL; Se: 60–125 µg/L

## 2. Data

In PKU patients, micronutrient deficiencies but no clinical symptoms have been reported, mainly for Zn, Se, Fe, folate and B<sub>12</sub> [3–5]. In this study 127 patients had altered values in one or several markers evaluated (Table 1), 58.33% were from CPKU, 21.67% from MPKU and 20% from MHPA patients. Interestingly, from these patients with altered values, the 84.16% had adequate adherence to diet.

**Table 1**

Characteristics of Hyperphenylalaninaemia patients with values of the biochemical parameters studied.

Characteristics of Hyperphenylalaninaemia patients with altered values of the biochemical parameters studied.

P: patient; M: male; F: female; BMI: body mass index; N: normal; ↑overweight, ↑↑ obesity, CPKU: classic phenylketonuria; MPKU: mild-moderate PKU; MHPA: moderate hyperphenylalaninaemia; Tre:Treatment; D: Dietetic; T: BH4 therapy; TD: time of diagnosis; E: Early; L:late; Phe tol: Phenylalanine tolerance; Prot: Total protein total; Prealb: Prealbumin; Fer: Ferritin.

Total protein, Ca, P, B<sub>12</sub>, ferritin, and Zn levels were in the normal range in almost all patients. Nevertheless, Palb was decreased in 34.6% of patients (74% from PKU) being the 94.4% of them below 18 years old and having the 96.3% an adequate adherence to treatment. Se was found to be diminished in 25% of patients, 76.9% of them with classic PKU but only in 2.56% of patients under BH4 treatment.

An adequate intake of Ca, P and 25-OHD is necessary for optimal bone accretion but it is not enough for bone normal development because several studies have showed that protein intake deficiency can influence the bone mass [6,7]. Our patients generally had adequate levels of Ca and P, but there were found low levels of 25-OHD in 14% of them. The 25-OHD was found altered in 14% of total patients. No deficiency of folic acid was found in our cohort, but was found to be above the upper limit in 39% of patients, 65.6% with classic PKU and 82% of them with adequate adherence to diet.

Patients treated with BH4 presented lower levels of B<sub>12</sub> with respect to non-treated (536 vs 694 pg/mL, p: 0.0094). No other anthropometric parameters were found to be correlated with any variable in our study.

We noted in our study a high percentage of PKU patients with good adherence to diet with Prealbumin deficiency and total protein normal. Also a high percentage of PKU patients with Se deficiency had folic acid increase. On the contrary, only el 2.56% de patients under BH4 treatment showed Se deficiency.
