Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(C-C) = 0.009$  Å;  $R$  factor = 0.059;  $wR$  factor = 0.113; data-to-parameter ratio = 12.8.

The title cocrystal,  $[Cu_2(C_2O_4)(NO_3)_2(C_7H_9N_3)_2(H_2O)_2] \cdot [Cu_2(C_2O_4)(NO_3)_2(C_7H_9N_3)_2(CH_4O)_2]$ , is a 1:1 cocrystal of two centrosymmetric Cu<sup>II</sup> complexes with oxalate dianions and Schiff base ligands. In each molecule, the Cu<sup>II</sup> centre is in a distorted octahedral *cis*-CuN<sub>2</sub>O<sub>4</sub> environment, the donor atoms of the *N,N'*-bidentate Schiff base ligand and the bridging *O,O'*-bidentate oxalate group lying in the equatorial plane. In one molecule, a monodentate nitrate anion and a water molecule occupy the axial sites, and in the other, a monodentate nitrate anion and a methanol molecule occupy these sites. In the crystal structure, intermolecular N—H···O, O—H···O and N—H···N hydrogen bonds link the molecules into a network. Weak intramolecular N—H···O interactions are also observed.

### Comment

The molecular structure of the title compound, (I), (Fig. 1) contains two centrosymmetric binuclear Cu<sup>II</sup> complexes (A and B) with the same Schiff base ligand. The coordination spheres around Cu<sup>II</sup> in both A and B are slightly distorted octahedra (Table 1), with the coordination plane of each Cu<sup>II</sup> formed by the N<sub>2</sub>O<sub>2</sub>donor atoms of the Schiff base N<sub>2</sub> and the oxalate O<sub>2</sub>. The axial positions in A are occupied by an O—NO<sub>2</sub> ion and a water molecule whereas in B these positions are occupied by a O-NO<sub>2</sub> ion and a CH<sub>3</sub>OH molecule. The in-plane Cu—O distances are in the range 1.966 (3)–2.000 (3) Å with Cu—N distances 1.955 (4)–1.994 (4) Å, which are slightly larger than distances observed in other Cu<sup>II</sup> coordination complexes of the same Schiff base ligand (Kelly et al <i>, 2005). The elongation of the Cu—O—NO<sub>2</sub> and Cu—O(water) or Cu—O(methanol) axial bonds [2.610 (4) and 2.251 (4) Å in A and 2.541 (4) and 2.338 (3) Å in B] clearly indicate the usual Jahn Teller distortion of the Cu<sup>II</sup> as has been found previously (Bulut et al <i>, 2005; Moreno et al <i>, 2007; Du et al <i>, 2007). The basal bond angles O—Cu—O and N—Cu—N are less than 90° [N1—Cu1—N2 = 80.63 (18) ° and N5—Cu2—N6 = 81.50 (17) °; O1—Cu1—O2 = 84.01 (13) ° and O7—Cu2—O8 = 85.09 (17) °] whereas the O—Cu—N angles are largely superior to 90° [N1—Cu1—O2 = 98.76 (16) ° and N2—Cu1—O1 = 95.46 (16) ° in A; N5—Cu2—O8 = 95.29 (15) ° and N6—Cu2—O7 = 97.93 (15) ° in B]. The axial bonds angles O(water)—Cu1—O—NO<sub>2</sub> and O(methanol)—Cu2—O—NO<sub>2</sub> are also less than the ideal value of 180° [168.34 (14) ° in A and 173.96 (12) ° in B]. A network of hydrogen bonds (Table 2) completes the structure.

### Experimental

To a mixture of 0.324 g (1.0 mmol) of the ligand and 50 ml of methanol was added dropwise a solution of 0.463 g (2.0 mmol) of copper nitrate dihydrate in 10 ml of methanol. The resulting mixture was stirred under reflux for 120 min. After cooling the solution was left for slow evaporation and the title compound was obtained in good yield (0.620 g; 94.00%). IR (cm<sup>-1</sup>, KBr): 1655, 1625, 1603, 1585, 1484, 1375, 1327, 1030, 829, 783, 699. Analysis calculated for C<sub>34</sub>H<sub>48</sub>N<sub>16</sub>O<sub>24</sub>Cu<sub>4</sub>: C 30.96, H 3.67, N 16.99 °; found: C 30.94, H 3.69, N 16.95 °. Green prisms of (I) were obtained from slow evaporation of a dimethylformamide solution.

### Refinement

All water H atoms and amine H atoms of the bidentate Schiff base ligand were located from the difference Fourier map and refined. The water O—H and amine N—H distances were restrained to be 0.96 Å, with s.u.'s of 0.02 Å. Others H atoms were placed geometrically and refined with a riding model.  $U_{\text{iso}}(\text{H})$  for H was assigned as 1.2  $U_{\text{eq}}$  of the attached C or N atoms (1.5 for methyl C atoms).

Primary atom site location: structure-invariant direct methods	

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
