The crystal structure of 6-(4-chlorophenyl)-2-(4-methylbenzyl)imidazo[2,1-*b*][1,3,4]thiadiazole-5-carbaldehyde

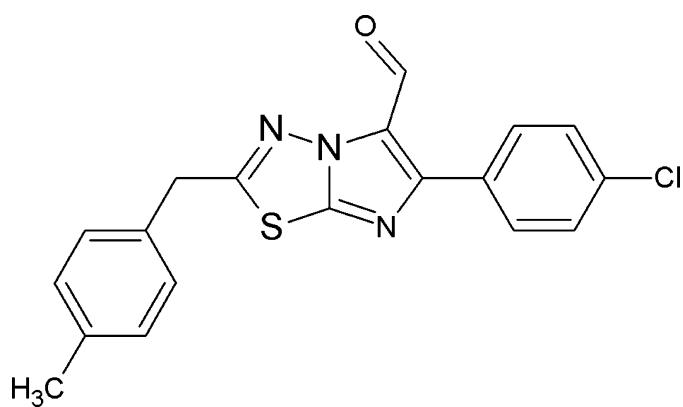

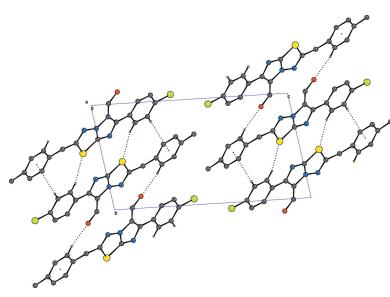

A. Sowmya,^a G. N. Anil Kumar,^{a*} Sujeet Kumar^b and Subhas S. Karki^b

^aDepartment of Physics, M. S. Ramaiah Institute of Technology, Bangalore, India, and ^bDepartment of Pharmaceutical Chemistry, KLE University's College of Pharmacy, Bangalore 560 010, India. *Correspondence e-mail: anilgn@msrit.edu

In the title imidazo[2,1-*b*][1,3,4]thiadiazole derivative, $C_{19}H_{14}ClN_3OS$, the 4-methylbenzyl and chlorophenyl rings are inclined to the planar imidazo[2,1-*b*][1,3,4]thiadiazole moiety (r.m.s. deviation = 0.012 Å) by 64.5 (1) and 3.7 (1)°, respectively. The molecular structure is primarily stabilized by a strong intramolecular C—H···O hydrogen bond, leading to the formation of a pseudo-seven-membered *S*(7) ring motif, and a short intramolecular C—H···N contact forming an *S*(5) ring motif. In the crystal, molecules are linked by pairs of C—H···S hydrogen bonds, forming inversion dimers. The dimers are linked by C—H···O and C—H···π interactions, forming chains propagating along [110].

1. Chemical context

The search for potential drugs to fight cancer and the design of molecules with limited side effects, particularly to the immune system, is an emerging area of research. Imidazo[2,1-*b*][1,3,4]-thiadiazole derivatives have been reported for their promising biological activities, and the most recent studies indicate their potential as antitumor agents (Karki *et al.*, 2011). However, active heterocyclic pharmacophores particularly at position 5 of the imidazo[2,1-*b*][1,3,4]thiadiazole moiety have shown significant activities; substitution of aldehydes at the 5-position resulted in an improvement of their anticancer activity (Kumar *et al.*, 2014), whereas a substituted phenyl group enhanced the anti-tubercular activity (Ramprasad *et al.*, 2015). In view of the above, we report herein on the synthesis and crystal structure of title imidazo[2,1-*b*][1,3,4]thiadiazole derivative.

OPEN ACCESS

2. Structural commentary

The molecular structure of the title compound is illustrated in Fig. 1. The carbaldehyde group is coplanar with the imidazothiadiazole ring system and *cis* to the chlorophenyl ring. Bond C12=O1 is *cis* to the C13–C14 bond, which favours the formation of an intramolecular C15–H15···O1 hydrogen bond (Table 1). The imidazole and thiadiazole rings show different π conjugations, resulting from their fused nature and also due to the groups attached to them. This is evident from the differences in the bond lengths S1–C9 [1.772 (4) Å] and S1–C10 [1.724 (2) Å] of the thiadiazole ring, indicating that the resonance effect caused by the imidazole ring is stronger than that caused by the thiadiazole ring. As a result, the imidazole system is more resonance stabilized. Additionally, the imidazothiadiazole moiety is planar and rigid with maximum deviations of 0.0182 (2) and –0.0078 (3) Å for atoms N2 and C13, respectively, from the mean plane. The 4-chlorophenyl ring makes a dihedral angle of 3.7 (1) $^\circ$, whereas the 4-methylbenzyl ring is inclined at an angle of 64.5 (1) $^\circ$ with respect to the mean plane of the imidazothiadiazole ring system. The molecular structure is primarily stabilized by the strong intramolecular C15–H15···O1 hydrogen bond, leading to the formation of a pseudo-seven-membered hydrogen-bonded *S*(7) ring motif, and an intramolecular C19–H19···N3 interaction forming an *S*(5) ring motif, thus locking the molecular conformation and eliminating conformational flexibility (Fig. 1 and Table 1).

3. Supramolecular features

In the crystal, the solid-state structure is stabilized primarily by a pair of C–H···S hydrogen bonds, forming inversion dimers (Table 1 and Fig. 2). These dimers are linked by pairs of C–H···O hydrogen bonds and C–H··· π interactions, forming chains propagating along [110]. There are no halogen interactions involving the chlorine atom, and no aromatic π – π stacking interactions present.

4. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.37, last update May 2016; Groom *et al.*, 2016) gave

55 hits for molecules containing the imidazo[2,1-*b*][1,3,4]-thiadiazole moiety. A search for 2-benzyl-6-phenylimidazo[2,1-*b*][1,3,4]thiadiazoles gave ten hits, and five of these compounds contain a 6-phenylimidazo[2,1-*b*][1,3,4]-thiadiazole-5-carbaldehyde moiety. It is interesting to note that the aldehyde group generally accepts a hydrogen bond, and that the *para*-substituted halogens do not generate any significant weak interactions in the crystal packing, except for a C–H···F interaction in 2-(4-fluorobenzyl)-6-phenylimidazo[2,1-*b*][1,3,4]thiadiazole-5-carbaldehyde (OWIFAC; Banu *et al.*, 2010), the 4-fluorobenzyl analogue of the title compound.

5. Synthesis and crystallization

The title compound was obtained according to a reported procedure (Kumar *et al.*, 2014). The Vilsmeier reagent was prepared at 273–278 K by adding dropwise phosphorous oxychloride (2.3 g, 15 mmol) into a stirred solution of DMF (10 ml). The 6-(4-chlorophenyl)-2-(4-methylbenzyl) imidazo[2,1-*b*][1,3,4]thiadiazole (4 mmol) was added slowly to the Vilsmeier reagent with stirring and cooling for 2 h. Further stirring was continued for 6 h at 353–363 K. The reaction

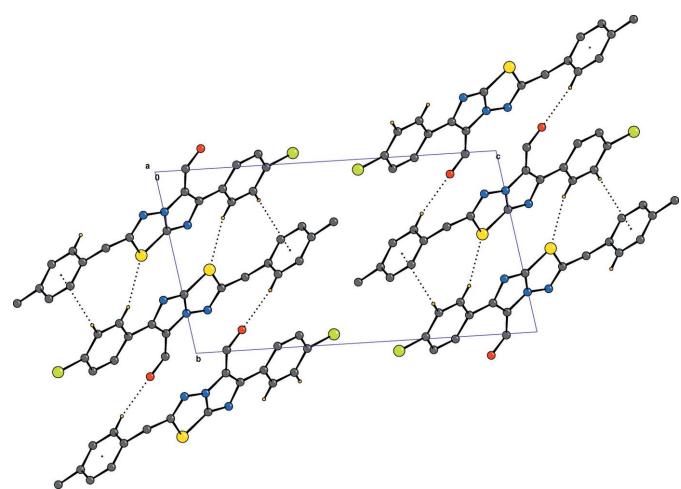

Figure 2

A view along the *a* axis of the crystal packing of the title compound. The intermolecular interactions are shown as dashed lines (see Table 1) and, for clarity, H atoms not involved in these interactions have been omitted.

mixture was then poured into 100 ml of water. The precipitate obtained was filtered, and neutralized with a cold aqueous solution of sodium carbonate. The solid obtained was filtered, washed with water and dried. Single crystals were obtained by slow evaporation of a solution in ethanol/DMF (2:1 *v:v*).

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. H atoms were positioned geometrically, with N—H = 0.86 Å and C—H = 0.93–0.96 Å, and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C-methyl})$ and $1.2U_{\text{eq}}(\text{C,N})$ for other H atoms.

Acknowledgements

The authors are grateful to Professor T. N. Guru Row, Indian Institute of Science and DST India, for the data collection on the CCD facility. GNA thanks MSRIT for encouragement.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Hydrogen-bond geometry (Å, °)

Cg is the centroid of the C2—C7 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C15—H15···O1	0.93	2.20	3.047 (3)	151
