Frailty is independently associated with worse health-related quality of life in chronic kidney disease: a secondary analysis of the Frailty Assessment in Chronic Kidney Disease study

Andrew C. Nixon, Theodoros M. Bampouras, Neil Pendleton, Sandip Mitra, Mark E. Brady, Ajay P. Dhaygude

Clinical Kidney Journal, sfz038, <https://doi.org/10.1093/ckj/sfz038>

In Table 3, in the 'Physical functioning' column, the 'Frailty Phenotype score' should have read '-0.65* (-0.77 to -0.50)' (the minus sign was originally missing before '0.77'). In addition, the legend of Figure 1 has been amended to include: 'Due to some participants having more than 1 Frailty Phenotype component, the sum of all the Frailty Phenotype components exceeds 100%.', a number has been rounded down to one decimal place in Table 2 and minor layout changes have been made to Table 3.
