Received 21 October 2010; accepted 9 November 2010

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.024; wR factor = 0.074; data-to-parameter ratio = 12.4.

The asymmetric unit of the title compound, $[\text{Co}(\text{N}_3)_2(\text{H}_2\text{O})_4] \cdot \text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_4$, comprises half of the cobalt(II) complex molecule and a half of the 3,3'-dicarboxylato-1,1'-ethylenedipyridinium molecule. The Co^{II} atom is located on an inversion centre and hence the complex molecule adopts a centrosymmetric *trans*-octahedral geometry. The zwitterionic organic molecule is also centrosymmetric with the centre of the C–C bond of the ethylene moiety coinciding with an inversion centre. The adduct of metal complex and organic molecule is associated into a three-dimensional network through O–H···O hydrogen bonds.

Tetraaquadiazidocobalt(II) 3,3'-dicarboxylato-1,1'-ethylenedipyridinium

Y.-Q. Wen, C.-Y. Tian and E.-Q. Gao

Comment

Hydrogen bonds play a key role in biological systems and materials, and they have been widely used as a putative supramolecular tool for engineering organic and metal-organic solids (Fabbiani *et al.*, 2010; Salitros *et al.*, 2010; Schultheis *et al.*, 2010; Braga & Grepioni, 2000). In this paper, we report the structure of the title compound, (I), which contains a neutral metal complex molecule, $[\text{Co}(\text{N}_3)_2(\text{H}_2\text{O})_4]$, and a zwitterionic dicarboxylate, 1,2-bis(3-carboxylatopyridinium)ethane (Fig. 1). The metal complex molecule is centrosymmetric, with the octahedral-coordinated Co^{II} by two azide anions and four water molecules in a *trans* arrangement (Fig. 1, Table 1). Two opposite $\text{Co}—\text{O}$ distances are longer than the $\text{Co}—\text{N}$ and other $\text{Co}—\text{O}$ ones, defining an axially elongated geometry. The zwitterionic molecule is also centrosymmetric (Fig. 1). The inorganic complex molecules and the carboxylate groups are associated into a sheet through $\text{O}—\text{H}…\text{O}$ hydrogen bonds involving the coordinated aqua ligands (O_3 and O_4) and the carboxylate oxygen atoms (O_1 and O_2) (Fig. 2, Table 2). The two O_4 aqua ligands from symmetry related complex molecules and two O_2 atoms from symmetry related organic molecules form a hydrogen-bonded ring which can be denoted by the graph set $R_4^2(8)$ (Bernstein *et al.*, 1995; Etter, 1990). Similar hydrogen-bonded rings are formed by O_1 and O_3 . The carboxylate group forms a $R_2^2(8)$ hydrogen-bonded ring with two aqua ligands from the same complex molecule. Besides, a large hydrogen-bonded ring [$R_4^4(16)$] is formed by two carboxylate groups and four aqua ligands from two complex molecules. The organic ligands interlink the hydrogen-bonded sheets of the metal complexes into the three-dimensional structure (Fig. 3).

Experimental

The zwitterionic ligand ($[\text{H}_2\text{L}^1]\text{Br}_2$) was synthesised from 1,2-dibromoethane and ethyl nicotinate according to the published procedure (Loeb *et al.*, 2006). An aqueous solution (4 mL) of $[\text{H}_2\text{L}^1]\text{Br}_2$ (0.1 mmol) and NaN_3 (1 mmol) was added to a DMF solution (1.5 mL) of $\text{Co}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$ (0.2 mmol) with stirring. The resulting solution was allowed to evaporate slowly at room temperature, yielding light-red block crystals of (I) in three days. Yield: 75%. Anal. calcd (found) (%) for $\text{CoC}_{14}\text{H}_{20}\text{N}_8\text{O}_8$: C, 34.79 (34.51); H, 4.39 (4.14); N, 22.87 (23.00). Main IR bands (KBr, ν/cm^{-1}): 3427*m*, 3097*w*, 2042 *s*, 1637 *s*, 1606 *s*, 1392*m*, 765*m*, 688*m*.

Refinement

All hydrogen atoms attached to carbon atoms were placed at calculated positions and refined with the riding model using AFIX 43 and AFIX 23 instructions for aromatic C—H and secondary CH_2 . The water hydrogen atoms were initially located from difference Fourier maps and refined isotropically with restraints on $\text{O}—\text{H}$ distance (0.85 Å) and $\text{H}—\text{O}—\text{H}$ angle, and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. The 'rigid-bond' restraint was applied on the azide moiety ($\text{N}_2—\text{N}_3—\text{N}_4$) using the SHELXL DELU instruction.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
