Crystal structure of *cis*-2-(2-carboxycyclopropyl)-glycine (CCG-III) monohydrate

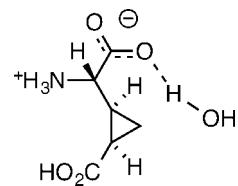

Sergey Lindeman, Nathaniel J. Wallock and William A. Donaldson*

Department of Chemistry, Marquette University, PO Box 1881, Milwaukee, WI 53201-1881, USA. *Correspondence e-mail: william.donaldson@marquette.edu

The title compound, $C_6H_9NO_4 \cdot H_2O$ [systematic name: ($\alpha R,1R,2S$)-*rel*- α -amino-2-carboxycyclopropaneacetic acid monohydrate], crystallizes with two organic molecules and two water molecules in the asymmetric unit. The space group is $P2_1$ and the organic molecules are enantiomers, thus this is an example of a ‘false conglomerate’ with two molecules of opposite handedness in the asymmetric unit (r.m.s. overlay fit = 0.056 Å for one molecule and its inverted partner). Each molecule exists as a zwitterion, with proton transfer from the amino acid carboxylic acid group to the amine group. In the crystal, the components are linked by N—H···O and O—H···O hydrogen bonds, generating (100) sheets. Conformationally restricted glutamate analogs are of interest due to their selective activation of different glutamate receptors, and the naturally occurring (+)-CCG-III is an inhibitor of glutamate uptake and the key geometrical parameters are discussed.

1. Chemical context

2-(2'-Carboxycyclopropyl)glycines **CCG-I**, **CCG-III** and **CCG-IV** (Fig. 1) are naturally occurring conformationally restricted analogs of glutamate isolated from *Aesculus parviflora*, *Blighia sapida* (Fowden, *et al.*, 1969), *Ephedra foeminea* (Caveney & Starratt, 1994), and *Ephedra altissima* (Starratt & Caveney, 1995). While not naturally occurring, both enantiomers of **CCG-II** (Fig. 1) have been prepared in the laboratory (Shimamoto, *et al.*, 1991) and all of the diastereomeric CCGs are useful tools for investigating the mechanism of glutamate function. The crystal structure of the title hydrate, (\pm)-**CCG-III** $\cdot H_2O$, is now reported.

2. Structural commentary

The racemic title compound (Fig. 2) crystallizes as a ‘false conglomerate’ with two molecules of opposite handedness in

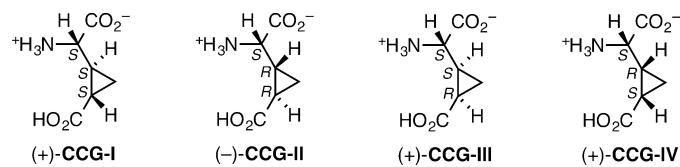

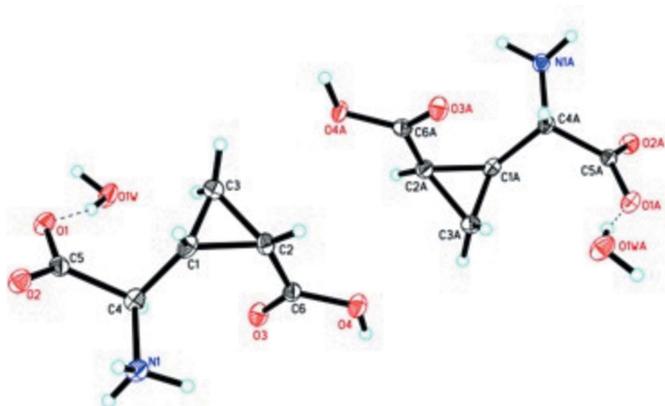

Figure 1
Structures of the diastereomers of 2-(2'-carboxycyclopropyl)glycine.

OPEN ACCESS

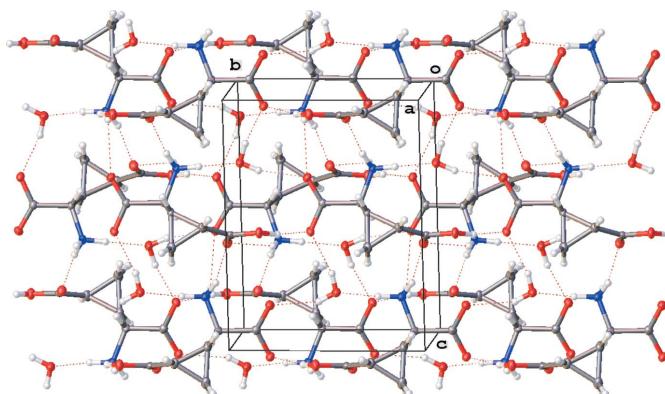

**Figure 2**

The asymmetric unit of the title compound, showing 50% displacement ellipsoids.

the asymmetric unit. Each of molecules of 2-(2'-carboxy-cyclopropyl)glycine has a molecule of water hydrogen bonded to the glycine carboxylate group. It has been estimated that only 1% of organic compounds are false conglomerates (Bishop & Scudder, 2009).

The torsion angles $O3-C6-C2-X = -4.3^\circ$ and $O3A-C6A-C2A-X = -11.1^\circ$ (where X is the midpoint of the distal cyclopropane bond) indicate that the carboxylic acid attached to the cyclopropane ring adopts a bisected conformation (Allen, 1980). The cyclopropane C–C bonds proximal to the C2 carboxylic group are roughly equal [$C1-C2 = 1.532$ (3); $C2-C3 = 1.512$ (3); $C1A-C2A = 1.520$ (3); $C2A-C3A = 1.516$ (2) Å] and are longer than the cyclopropane bonds distal to the C2 carboxylic acid [$C1-C3 = 1.489$ (2); $C1A-C3A = 1.484$ (2) Å]. These distances and torsion angles are consistent with other cyclopropane carboxylic acids (Allen, 1980).

Conformationally restricted glutamic acid analogs can be classified into one of four categories, which are characterized by the distances between the nitrogen atom of the amino group and the γ -carboxylate carbon atom (d_1), between the α - and γ -carboxylate carbon atoms (d_2), and their sum ($d_1 + d_2$).

**Figure 3**

The packing for the title compound viewed approximately down [100], with hydrogen bonds shown as dashed lines.

Table 1
Hydrogen-bond geometry (Å, °).

N1—H1B \cdots O2A ⁱⁱ	0.86 (2)	2.39 (2)	2.9454 (18)	123.1 (16)
N1—H1C \cdots O1WA ⁱ	0.98 (3)	1.83 (3)	2.795 (2)	167 (2)
O4—H4 \cdots O1 ⁱⁱⁱ	0.81 (3)	1.79 (3)	2.5851 (18)	166 (3)
O1W—H1WA \cdots O2A ^{iv}	0.82 (3)	2.01 (3)	2.8072 (19)	166 (2)
O1W—H1WB \cdots O1	0.86 (2)	1.90 (2)	2.7449 (16)	169 (2)
N1A—H1AA \cdots O3 ^v	0.90 (2)	2.01 (2)	2.9087 (18)	173 (2)
N1A—H1AB \cdots O3A ^{vi}	0.87 (2)	2.38 (2)	3.1151 (19)	141.7 (17)
N1A—H1AC \cdots O1W ^v	0.93 (2)	1.87 (2)	2.785 (2)	165.6 (18)
O4A—H4AA \cdots O1A ^{vii}	0.98 (3)	1.60 (3)	2.5672 (16)	168 (2)
O1WA—H1WC \cdots O2 ^{viii}	0.83 (3)	2.07 (3)	2.8628 (19)	158 (2)
O1WA—H1WD \cdots O1A	0.81 (2)	1.98 (3)	2.7717 (17)	166 (3)

Symmetry codes: (i) $-x+1, y-\frac{1}{2}, -z$; (ii) $x-1, y-1, z-1$; (iii) $x, y+1, z$; (iv) $-x+1, y-\frac{3}{2}, -z+1$; (v) $-x+1, y+\frac{1}{2}, -z+1$; (vi) $-x+2, y+\frac{1}{2}, -z+1$; (vii) $x, y-1, z$; (viii) $-x+1, y+\frac{3}{2}, -z$.

The classifications ‘folded’, ‘semi-folded’, ‘semi-extended’, and ‘extended’ are defined by $(d_1 + d_2) \leq 7.5$ Å, $7.5 \text{ \AA} \leq (d_1 + d_2) \leq 8.0$ Å, $8.0 \text{ \AA} \leq (d_1 + d_2) \leq 8.5$ Å, and $(d_1 + d_2) \geq 8.5$ Å, respectively (Pellicciari, *et al.*, 2002). The two enantiomeric molecules in the crystal structure evidence the following distances/sums: d_1 , 3.65 and 3.71 Å; d_2 , 4.59 and 4.59 Å; $(d_1 + d_2)$, 8.24 and 8.30 Å, respectively. From these values, these conformers of CCG-III can be considered to be in the ‘semi-extended’ class.

Computer programs: *APEX2* and *SAINT* (Bruker, 2005), *SHELXTL* and *SHELXL97* (Sheldrick, 2008).

3. Supramolecular features

In the crystal, the molecules are linked by N—H···O and O—H···O hydrogen bonds, forming sheets parallel to (100); Table 1 and Fig. 3.

4. Synthesis and crystallization

The racemic title compound was prepared according to the literature procedure (Wallock & Donaldson, 2004). A sample for X-ray diffraction analysis was recrystallized from water.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2.

 $l = 0 \rightarrow 12$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.021$
 $wR(F^2) = 0.055$
 $S = 1.06$
2164 reflections
305 parameters
1 restraint
Primary atom site location: structure-invariant
direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: difference Fourier map
All H-atom parameters refined
 $w = 1/[\sigma^2(F_o^2) + (0.0523P)^2 + 0.0652P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.15$ e Å⁻³
 $\Delta\rho_{\min} = -0.16$ e Å⁻³
Absolute structure: Flack (1983), 836 Friedel pairs
Absolute structure parameter: 0.57 (15)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
