Phylogeny

ABSTRACT

Hoya verticillata var *verticillata*, an epiphytic plant, is both an ornamental and a valuable medicinal plant. However, *H. verticillata* has a similar morphology to other species belonging to the *Hoya* genus, so it is challenging to distinguish the *H. verticillata* var *verticillata*, plant accurately. Alternatively, if *H. verticillata* var *verticillata*, is deformed or powdered, it is more challenging to identify. This dataset includes information on *H. verticillata* var *verticillata*, samples collected from the natural environment and four chloroplast DNA markers to support *H. verticillata* var *verticillata*, species identification. Phylogenetic analysis based on sequences of intergenic spacer regions (trnK-rps16, rps16-trnQ, psbl-atpA, and ndhC-trnV) shows that *H. verticillata* var *verticillata*, is very closely related and distributed in the same group as *Hoya carnosa* with a Bootstrap coefficient of 99–100 %. Four intergenic spacer region sequences, trnK-rps16, rps16-trnQ, psbl-atpA, and ndhC-trnV from the chloroplast genome are potential DNA barcoding candidates to distinguish *H. verticillata* var *verticillata*, from different species in the *Hoya* genus.

1. Value of the Data

- *Hoya verticillata* var *verticillata*, an epiphytic plant, has significant medicinal value. *H. verticillata* var *verticillata* contains many biologically active medicinal substances, effective in treating some for human diseases.
- A dataset on intergenic spacer region sequences, trnK-rps16, rps16-trnQ, psbl-atpA, and ndhC-trnV from the chloroplast genome can be used to develop potentially useful molecular markers and support species identification, especially when plant specimens are deformed and in powder form.
- The analysis of molecular phylogeny and evolution of *Hoya* genus based on the intergenic spacer regions sequences.

2. Background

Hoya verticillata var *verticillata*, an epiphyte that climbs and belongs to the Apocynaceae family [1], is a precious medicinal plant. *H. verticillata* var *verticillata* widely used in traditional medicine to treat kidney diseases, urinary tract disorders, rheumatism, jaundice, fever and diarrhea [2]. Therefore, accurate species identification is the basis for the effective use of *H. verticillata* var *verticillata* in medical treatment in traditional medicine in Vietnam.

Chloroplast DNA has a double circular structure, and different regions in the DNA molecule have different mutations [3]. Therefore, it is possible to determine close or distant relationships of plant objects based on the different levels of variation of a particular DNA region. So, regions with high variability are used for phylogenetic analysis and selected as potential DNA barcodes to support species identification. The complete chloroplast genome of *H. verticillata* var *verticillata* has been sequenced, analyzed and registered on GenBank with code OR475244.1 [4]. Accordingly, some intergenic spacer regions belonging to the large single-copy region (LSC) with high nucleotide diversity (Pi), such as trnK-rps16, rps16-trnQ, psbl-atpA, and ndhC-trnV, were identified. So, these IS regions may be potential DNA markers for identification and phylogenetic analysis of *Hoya* that need to be explored.

3. Data Description

The present work employs data on *H. verticillata* var *verticillata* specimens. The leaf samples and specimens of *H. verticillata* var *verticillata* samples (Voucher HOYP202305TN) were collected in May 2023 at Hang Trai area, Tan Long commune, Dong Hy district, Thai Nguyen province, Vietnam, in the coordinates of 21°43'34" N, 105°50'52" E (Fig. 1). The *H. verticillata* var *verticillata* plant has a cylindrical root with a strongly developed main root and lateral roots. The small tree trunk is climbing and has 5–20 mm long aerial roots. Leaves are simple, growing oppositely on

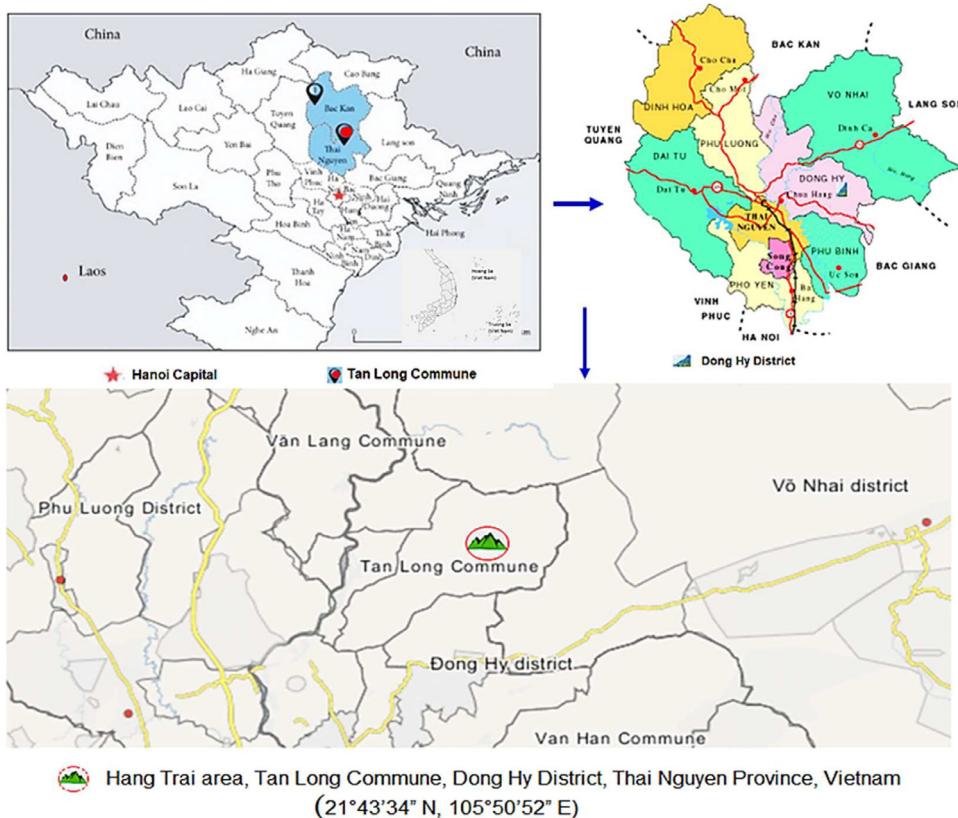

Fig. 1. Map showing *Hoya verticillata* var. *verticillata* sample collection location Hang Trai area, Tan Long commune, Dong Hy district, Thai Nguyen province, Vietnam in the coordinates of 21°43'34" N, 105°50'52" E.

the trunk and branches. Fat leaves, oval blades up to 7 cm long, 1.3–2.5 cm wide. Leaf stalks are 10–20 mm long, with sparse fine hairs (Fig. 2).

Four intergenic spacer regions of *H. verticillata* var. *verticillata* chloroplast genome (cp) [1] with high Pi, trnK-rps16, rps16-trnQ, ndhC-trnV and psbl-atpA were selected as cp DNA barcodes with nucleotide sequences as shown in Table 1. *H. verticillata* var. *verticillata* is distributed in the same group as *Hoya carnosa* with a Bootstrap coefficient of 99–100 % on the phylogenetic tree established based on the four regions trnK-rps16, rps16-trnQ, ndhC-trnV and psbl-atpA (Fig. 3 and Table S1, Fig. 4 and Table S2, Fig. 5 and Table S3, Fig. 6 and Table S4).

4. Experimental Design, Materials and Methods

4.1. Sample collection and data source creation for analysis

The *Hoya verticillata* var. *verticillata* samples (Voucher HOYP202305TN) were collected in May 2023 at Hang Trai area, Tan Long commune, Dong Hy district, Thai Nguyen province, Vietnam, in the coordinates of 21°43'34" N, 105°50'52" E. The *Hoya verticillata* var. *verticillata* was identified by comparative morphological methods at the Botany Department in the Faculty of Biology, Thai

Fig. 2. *Hoya verticillata* var. *verticillata* plant growing in natural environment (A, B, C, D) were collected at Hang Trai area, Tan Long commune, Dong Hy district, Thai Nguyen province, Vietnam and kept at the experimental garden (E) of the Department of Biology, Thai Nguyen University of Education, Vietnam.

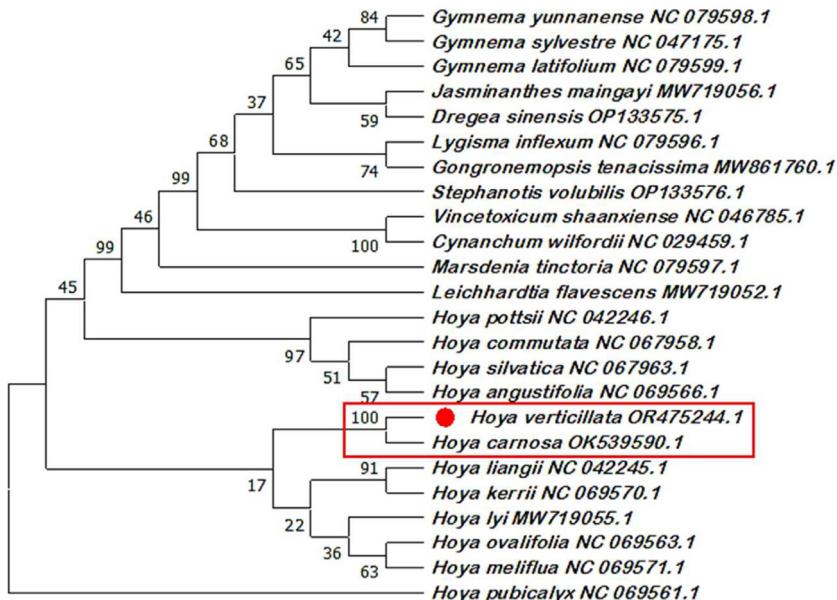

Fig. 3. Phylogenetic tree construction using the trnK-rps16 intergenic spacer region of *Hoya verticillata* var. *verticillata* chloroplast genome and of other species belongs the Apocynaceae family.

Nguyen University of Education. The voucher specimens were placed in the Herbarium of the Department of Biology, Thai Nguyen University of Education, Vietnam.

Total DNA extracted from leaves was used for chloroplast DNA sequencing. The chloroplast genome of *H. verticillata* var. *verticillata* is registered on GenBank. Nucleotide diversity (π) of DNA regions in chloroplast DNA was calculated by sliding window analysis performed in DnaSP v.6.11.01 [14], and DNA regions with high nucleotide diversity were selected for analysis.

The intergenic spacer regions of other species belonging to the Apocynaceae family were obtained by a Basic Local Alignment Search Tool (BLAST) search on the National Center For Biotechnology Information (NCBI) [5].

4.2. Phylogenetic analysis

Evolutionary analyses of some gene regions were conducted in MEGA v11.0.13 [6]. The evolutionary history was inferred using the Maximum Likelihood method and the Tamura-Nei model [7]. The bootstrap consensus tree inferred from 1000 replicates is taken to represent the evolutionary history of the taxa analyzed [8]. For the trnK-rps16 intergenic spacer region, the analysis was performed with 24 species (Table S1), for rps16-trnQ with 44 species (Table S2), for ndhC-trnV with 47 species (Table S3), and for psbl-atpA with 46 species (Table S4).

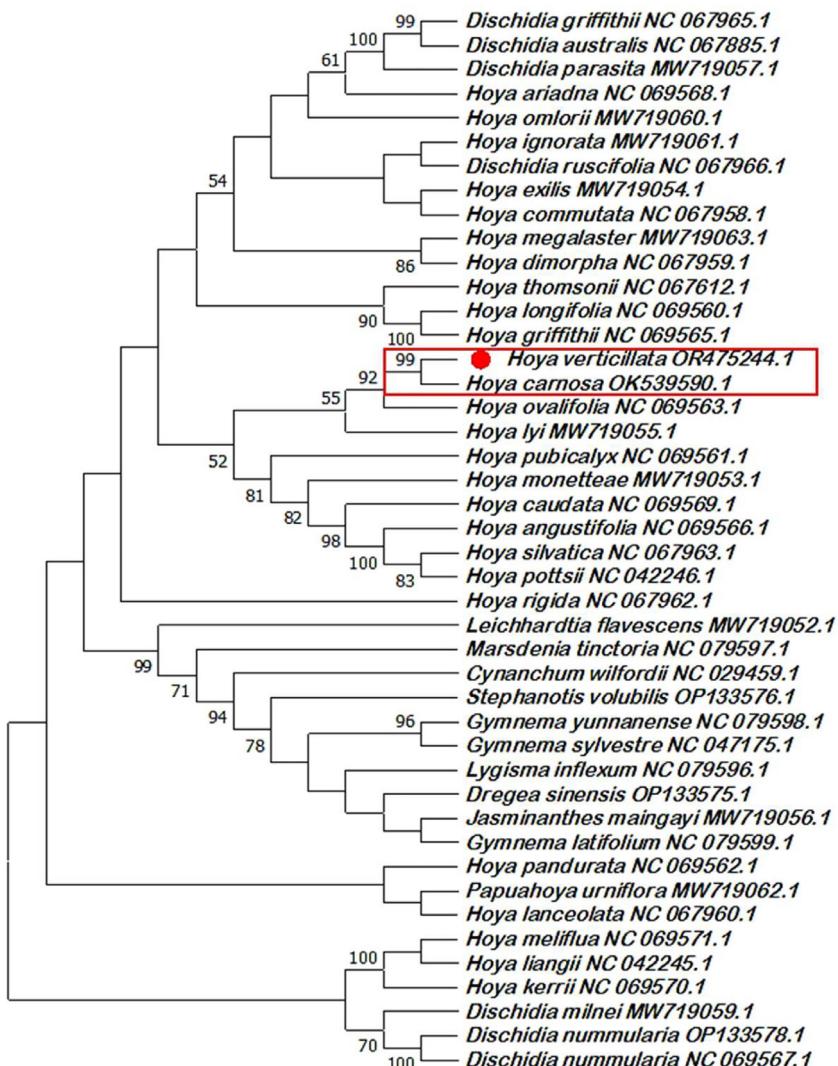

Fig. 4. Phylogenetic tree construction using the rps16-trnQ intergenic spacer region of *Hoya varticillata* var. *varticillata* chloroplast genome and of other species belongs the Apocynaceae family.

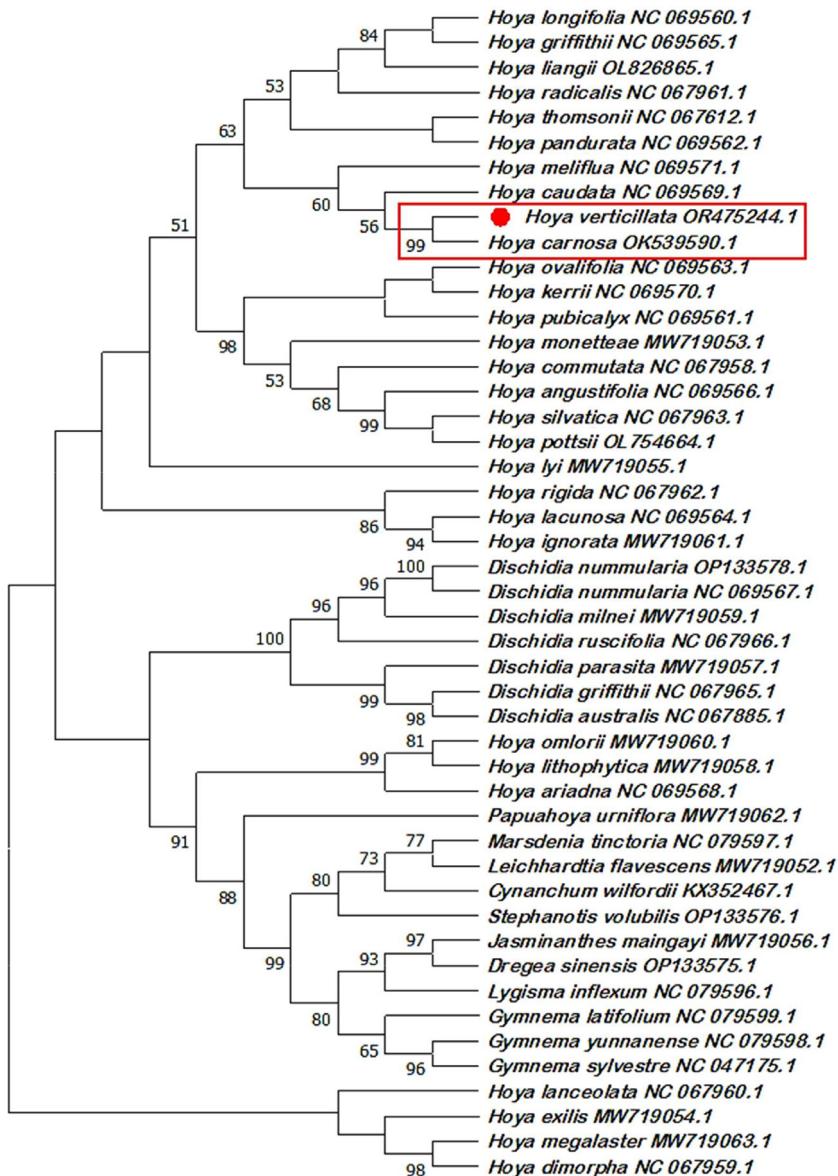

Fig. 5. Phylogenetic tree construction using the ndhC-trnV intergenic spacer region of *Hoya verticillata* var. *verticillata* chloroplast genome and of other species belongs the Apocynaceae family.
