Received 26 September 2010; accepted 8 October 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ (C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.110; data-to-parameter ratio = 10.2.

In the title compound, $C_{14}H_{13}NO$, the dihedral angle between the aromatic rings is 66.08 (9)°. Chains are formed along the b axis through intermolecular $N-H\cdots O$ hydrogen bonds. The crystal structure is further stabilized by $C-H\cdots \pi$ interactions.

4-(p-Tolylamino)benzaldehyde

X. Tian, Y.-S. Xie and H. Zuo

Comment

Due to their wide range of applications and special pharmacological activities diarylamines represent an important class of chemical compounds (Abou-Seri, 2010; Kostrab *et al.*, 2008). We report here the synthesis and the crystal structure of one such diarylamine, the title compound 4-(p-tolylamino)benzaldehyde.

The title compound, $C_{14}H_{13}NO$, consists of benzaldehyde and tolyl groups connected through a central amino nitrogen atom (Fig. 1). The dihedral angle between the aromatic rings is $66.08~(9)^{\circ}$. In the crystal, one-dimensional chains are formed along the *b*-axis through intermolecular N—H···O hydrogen bonding interactions (Fig. 2). The chains are in turn linked through weak intermolecular C—H··· π contacts involving the C8–C13 phenyl ring (centroid Cg1) into a three-dimensional network structure (Table 1).

Experimental

To a magnetically stirred solution of p-toluidine (1.0 mmol) and Cs₂CO₃ (3.2 mmol) in dry DMF cooled by an ice bath were added chloroacetyl chloride (1.2 mmol) and 4-hydroxybenzaldehyde (1.0 mmol). The reaction mixture was then stirred for 30 min at room temperature and placed into a microwave oven (600 W, 424 K) and irradiated for 35 min. The solvent was removed under vacuum and water (20 ml) was added to the residue. The mixture was then extracted with ethyl acetate (4 × 30 ml). The combined organic layers were dried over anhydrous MgSO₄ and evaporated under vacuum to give the crude product. The product was purified by column chromatography on silica gel using ethyl acetate/petroleum ether (yield 89%). Mp 358-362 K; 1 H NMR (300 MHz, CDCl₃): δ 2.35 (s, 3H; CH₃), 6.20 (s, 1H; NH), 6.95 (d, J = 8.4 Hz, 2H; ArH), 7.10 (d, J = 8.1 Hz, 2H; ArH), 7.18 (d, J = 8.1 Hz, 2H; ArH), 7.72 (d, J = 8.4 Hz, 2H; ArH), 9.77 (s, 1H; CHO). 13 C NMR (75 MHz, CDCl₃): δ 20.8 (CH₃), 113.9 (CH), 122.1 (CH), 128.1 (C), 130.1 (CH), 132.1 (CH), 134.0 (C), 137.2 (C), 150.5 (C), 190.3 (CHO). Crystals suitable for X-ray diffraction were obtained by slow evaporation of a solution of the solid dissolved in ethyl acetate/petroleum ether at room temperature for 5 days.

Refinement

In the absence of significant anomalous dispersion effects, Friedel pairs were merged.

Aromatic and methyl H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93 Å for aryl and 0.96 Å for methyl H atoms, and with $U_{\rm iso}({\rm H})$ =1.2 $U_{\rm eq}({\rm C})$ for aryl Hatoms, and 1.5 $U_{\rm eq}({\rm C})$ for methyl H atoms. The aldehyde (C14) and N-bound H-atoms were located in a difference Fourier map and their positions and $U_{\rm iso}$ values were freely refined.

Figures

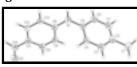

Fig. 1. The molecular structure of the title compound, with displacement ellipsoids drawn at the 30% probability level.

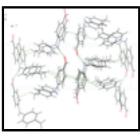

Fig. 2. The crystal packing of the title compound. Intermolecular hydrogen bonds and C—H··· π contacts are shown as dashed lines.

Refinement

Primary atom site location: structure-invariant direct Refinement on F^2

methods

Least-squares matrix: full Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring $R[F^2 > 2\sigma(F^2)] = 0.038$

H atoms treated by a mixture of independent and $wR(F^2) = 0.110$

constrained refinement

S = 1.07 $w = 1/[\sigma^2(F_0^2) + (0.0662P)^2 + 0.0847P]$

	where $P = (F_0^2 + 2F_c^2)/3$
1555 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
153 parameters	$\Delta \rho_{max} = 0.12 \text{ e Å}^{-3}$
0 restraints	$\Delta \rho_{\min} = -0.16 \text{ e Å}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
