The title compound, $C_{10}H_{10}N_4^{2+}\cdot NO_3^- \cdot ClO_4^-$, was obtained unexpectedly by the reaction of $Co(ClO_4)_2 \cdot 6H_2O$ and cytidine-5'-monophosphate with 4,4'-azopyridine in an aqueous solution of nitric acid. The molecular structure comprises two planar 4,4'-diazenediyldipyridinium dications lying on inversion centres and perchlorate and nitrate anions in general positions. In the crystal, N—H···O hydrogen bonds between dications and anions lead to the formation of [232] chains.

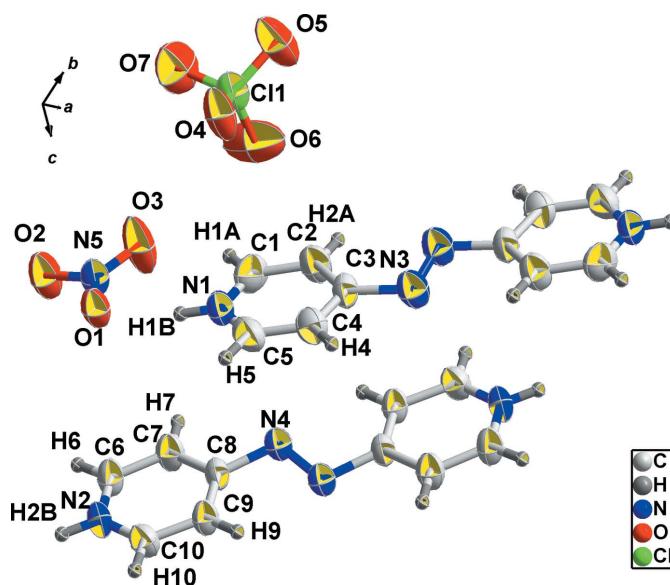

1. Chemical context

If a molecule contains two connected six-membered rings, and each of them contains N atoms, this molecule can coordinate various metal ions in different ways. In particular, molecules containing two or more pyridine rings are perfect bridging ligands to form supramolecular structures (Zhang *et al.*, 2005; Rusu *et al.*, 2012; Theilmann *et al.*, 2009; Aakeröy *et al.*, 2013*a,b*; Huang *et al.*, 2016; Santana *et al.*, 2017; Hutchins *et al.*, 2018). In our previous work (Qiu *et al.*, 2017), we used, together with a cytidine-5'-monophosphate mononucleotide (CMP), an auxiliary ligand, namely 4,4'-azopyridine (azpy), to completely coordinate a metal ion to restrain the non-enzymatic hydrolysis of the phosphate group catalyzed by these ions, and we obtained the complex Co-CMP-azpy under pH = 5. As a result of the different charge states of CMP in aqueous solution, it seems to be meaningful to study nucleotide complexes at other pH values. Unexpectedly, single crystals of the title compound were obtained in a more acidic medium (pH = 3). The title compound is the first example of a salt of 4,4'-diazenediyldipyridinium dication with two different anions.

2. Structural commentary

The molecular structure of the title compound comprises two planar [within 0.261 (5) Å] 4,4'-diazenediyldipyridinium dications lying on inversion centers and perchlorate and nitrate

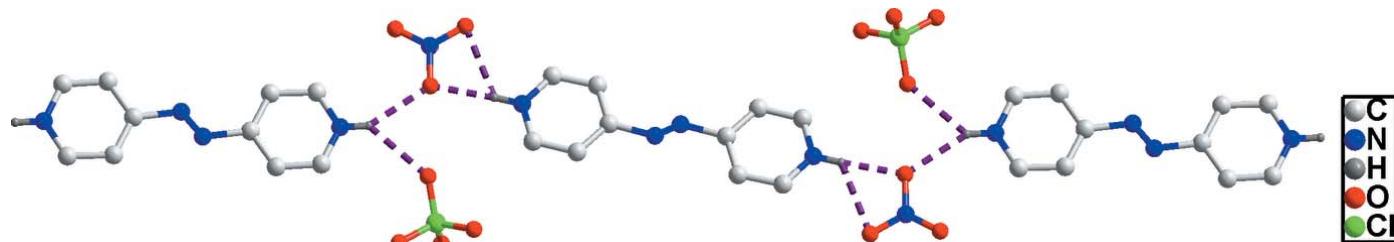

**Figure 1**

The structure of the title compound showing the asymmetric unit (labelled) with cations supplemented by the symmetry-generated moieties (not labelled) at $1 - x, 2 - y, 2 - z$ (molecule containing N1/N3) and at $1 - x, 1 - y, 2 - z$ (molecule containing N2/N4). Displacement ellipsoids are drawn at the 50% probability level.

anions in general positions (Fig. 1). A planar conformation of the 4,4'-diazenediyldipyridinium dications is commonly observed for this type of compound. However, in the structure of bis(4,4'-diazenediyldipyridinium) bis(μ -chloro)octachlorodibismuth (POPHIO; Klein, 2019a) pyridinium rings are twisted by $19.0\ (4)^\circ$, whereas in the structure of 4,4'-diazenediyldipyridinium bis(iodide) (POPKEN; Klein, 2019b) the mean planes of the pyridinium rings form a dihedral angle of $84.1\ (2)^\circ$. In the title 4,4'-diazenediyldipyridinium, the value of the dihedral angle between the planes passing through the pyridine rings is 0° .

3. Supramolecular features

The 4,4'-diazenediyldipyridinium dications are connected by N—H \cdots O hydrogen bonds with nitrate anions thus forming chains directed along [232] (Fig. 2, Table 1). The perchlorate anions are attached to these chains via N—H \cdots O hydrogen bonds. C—H \cdots O interactions are also observed.

**Figure 2**

Chain in the structure of the title compound formed by N—H \cdots O hydrogen bonds (shown as dashed lines). Hydrogen atoms not involved in hydrogen bonding are omitted.

Symmetry codes: (i) $-x, -y, -z + 1$; (ii) $-x, -y + 1, -z + 1$; (iii) $x, y, z + 1$; (iv) $-x + 1, -y + 1, -z + 1$; (v) $x, y - 1, z$.

4. Database survey

A search of the Cambridge Structural Database (CSD version 5.40, update of March 2020; Groom *et al.*, 2016) for the 4,4'-diazenediyldipyridinium dication gave 17 hits, of which four purely organic structures are closely related to the title compound. In the crystal of 4,4'-diazenediyldipyridinium dinitrate (HUKQIN; Felloni *et al.*, 2002), N—H \cdots O hydrogen bonds connect the dication to two anions, thus forming an island structure. The same type of structure is present in 4,4'-diazenediyldipyridinium dichloride (POBUU; Klein, 2019c) and 4,4'-diazenediyldipyridinium diiodide (POPKEN; Klein, 2019b). In the salt with partially deprotonated 1,2,4,5-benzenetetracarboxylic acid (BULJEZ; Ravat *et al.*, 2015), the 4,4'-diazenediyldipyridinium dications act as the spacers that join the layers of hydrogen-bonded anions into a three-dimensional structure.

5. Synthesis and crystallization

An aqueous solution (5 mL) of cytidine-5'-monophosphate (32 mg, 0.10 mmol) was added to an aqueous solution (5 mL) of $\text{Co}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$ (18 mg, 0.05 mmol). After stirring for 10 min, 4,4'-azopyridine (9 mg, 0.05 mmol) in distilled water (5 mL) was added to this mixture. Nitric acid was also dropped to it and the resulting solution (pH = 3) was stirred at room

Table 2

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
