As the proportion of older adults in the world's total population continues to grow, the deleterious downstream health economic outcomes of age-related hearing loss are steadily becoming more prevalent. While recent research has shown that age-related hearing loss is the single greatest modifiable risk factor for dementia, the rate of hearing aid use remains low in many countries across the globe. Reasons for poor uptake are multifactorial and likely involve a combination of factors, ranging from increasing costs of hearing aid technology to lack of widespread insurance coverage. This paper aims to first identify the current state of hearing aid access across the world using eight representative countries as examples. We then provide recommendations on how to facilitate greater access to hearing aids for consumers by addressing areas in regulation, technology, reimbursement, and workforce.

STRENGTH IN AGE-FRIENDLY HEALTH SYSTEMS: AN INNOVATIVE INTEGRATED INTERPROFESSIONAL MODEL

Teri Kennedy[1], *1. The University of Kansas Medical Center, Kansas City, Kansas, United States*

This paper presents an innovative conceptual approach to health care policy for older adults: the Age-Friendly Health Systems Integrated Interprofessional Model. In 2017, the John A. Hartford Foundation and Institute for Healthcare Improvement, in partnership with the American Hospital Association and Catholic Health Association of the United States, advanced the concept of an Age-Friendly Health System. This initiative is designed to respond to the needs of a burgeoning U.S. older adult population, expected to double from 2012 to 2050, largely due to the aging of Baby Boomers and increased life expectancy. These Baby Boomers will demand a well-coordinated, communicative health system responsive to their values and preferences. In an Age-Friendly Health System, all older adults receive the best possible care, without care-related harms, and with satisfaction of care received. Essential elements include what matters, mentation, mobility, and medications, with a focus on patient-directed, family-engaged care. While a solid framework for improving healthcare for older adults, this model is further strengthened by incorporating the essential elements of person-, family-, and community-centered approaches to care; interprofessional team-based competencies, and Quadruple Aim outcomes. This enhanced model, referred to as the Age-Friendly Health System Integrated Interprofessional Model, combines elements essential to quality healthcare within the framework of an Age-Friendly Health System. This paper will present the original Age-Friendly Health System framework, the proposed Age-Friendly Health System Integrated Interprofessional Model, then compare and contrast each model's essential principles. Implications for adoption of this enhanced model for policy, education, and practice will be explored.

THE IMPACT OF MANDATED COGNITIVE ASSESSMENTS ON ALZHEIMER'S DISEASE AND RELATED DEMENTIA DIAGNOSIS RATES

Johanna Thunell,[1] and Julie Zissimopoulos[1], *1. University of Southern California, Los Angeles, California, United States*

Although no cure for Alzheimer's disease exists, early diagnosis allows clinicians to detect reversible causes of memory loss, inform pharmacologic treatment options that may delay cognitive decline, and inform patients about clinical trial opportunities. It allows patients to communicate medical, legal, financial, living, and end-of-life desires. Barriers to diagnosis include low public awareness of early symptoms, stigma and misconceptions about the disease that delay seeking medical assistance. Provider-related barriers include low recognition of cognitive impairment and/or insufficient training in dementia diagnosis, and reimbursement issues. The new annual wellness visit (AWV) benefit available to Medicare Part B beneficiaries may reduce some of these barriers. The Patient Protection and Affordable Care Act of 2010 mandated an AWV that, along with routine preventive services, included for the first time, a cognitive screen at each visit. In this study, we analyze the effect of the introduction of the AWV benefit on Alzheimer's disease and related dementias (ADRD) diagnoses rates, average age at diagnosis and geographic dispersion of diagnoses. We use the 100% sample of Medicare claims and regression discontinuity to estimate the impact of the legislation enactment. Preliminary analyses show immediate and increasing take-up in AWV visits after the policy went into effect. The total number of preventative exams claims went from about 2,500 to 27,000 immediately after the policy and continued to grow in subsequent months. We also observe an increase in ADRD incidence in the months immediately following ACA, from about 14,000 claims in December 2010 to about 16,000 in January 2011.

SUCCESSFUL AGING

A SELF-RELIANT UMBRELLA: DEFINING SUCCESSFUL AGING AMONG THE OLD-OLD (80+) IN SHANGHAI

Lin Chen,[1] Minzhi Ye,[2] and Eva Kahana[3], *1. Fudan University, Shanghai, China, 2. Benjamin Rose Institute on Aging, Cleveland, Ohio, United States, 3. Case Western Reserve University, Cleveland, Ohio, United States*

The Chinese old-old (80+) population has steadily increased in recent years; however, limited studies have examined how they age. The purpose of this study is to explore how the old-old in urban China define successful aging. Guided by grounded theory, community-dwelling old-old individuals participated in semi-structured, in-depth interviews (N= 97). Participants identified self-reliance as the goal of successful aging, which was supported by four proactive behaviors, including physical activity, financial security, community connectedness, and willing acceptance of reality. These four proactive behaviors were conceptualized to constitute the ribs of an umbrella model offering a canopy to protect the pole of self-reliant successful aging. This study offers new insight in understanding dynamic and nuanced ways that the old-old in urban China age successfully and their valiant efforts to maintain an ideal status.

COMMUNITY CAPACITY AND SOCIAL PARTICIPATION AMONG COMMUNITY-DWELLING MIDDLE-AGED AND OLDER CHINESE

Min Li,[1] and Fang-Yi Huang[2], *1. University of Florida, Gainesville, Florida, United States, 2. Trinity Washington University, College Park, Maryland, United States*
