The asymmetric unit of *catena*-poly[[[(1,4,8,11-tetraazacyclotetradecane- $\kappa^4N^1,N^4,N^8,N^{11}$ )nickel(II)]- $\mu_2$ -5-carboxybenzene-1,3-dicarboxylato- $\kappa^2O^1:O^3$ ] octahydrate],  $\{[Ni(C_9H_4O_6)(C_{10}H_{24}N_4)]\cdot8H_2O\}_n$  (**I**), consists of a macrocyclic  $Ni^{2+}$  cation, a carboxylate dianion and eight highly disordered water molecules of crystallization. The components of the compound *catena*-poly[[[(1,4,8,11-tetraazacyclotetradecane- $\kappa^4N^1,N^4,N^8,N^{11}$ )nickel(II)]- $\mu_2$ -5-carboxybenzene-1,3-dicarboxylato- $\kappa^2O^1:O^3$ ] monohydrate],  $\{[Ni(C_9H_4O_6)(C_{10}H_{24}N_4)]\cdot H_2O\}_n$  (**II**), are two crystallographically unique centrosymmetric macrocyclic dication, a carboxylate dianion and one water molecule of crystallization. In each compound, the metal ion is coordinated in the equatorial plane by the four secondary N atoms of the macrocyclic ligand, which adopts the most energetically stable *trans*-III conformation, and two mutually *trans* O atoms of the carboxylate anions in a slightly tetragonally distorted *trans*- $Ni_4O_2$  octahedral geometry. The crystals of both compounds are composed of parallel coordination polymeric chains running along the [010] direction in **I** and the [110] and [1 $\bar{1}$ 0] directions in **II**. The bridging carboxylate anions display different modes of coordination connected with the relative orientation of coordinated O atoms, *i.e.*, remote in **I** and intermediate in **II**, thus resulting in essentially different distances between the Ni atoms in the chains [11.0657 (4) and 8.9089 (2) Å in **I** and **II**, respectively]. As a result of hydrogen-bonding interactions, the chains are joined together in sheets oriented parallel to the (10 $\bar{1}$ ) and (001) planes in **I** and **II**, respectively.

## 1. Chemical context

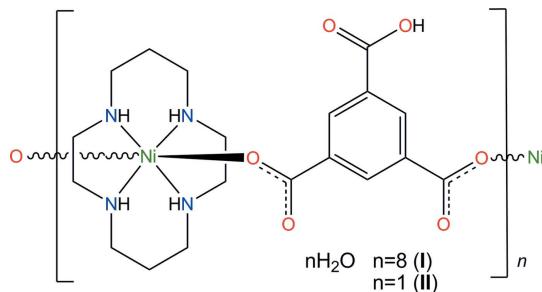

Azamacrocyclic complexes of transition metals are widely used for the construction of metal–organic frameworks (MOFs) – crystalline porous materials displaying many promising properties connected with the possibilities of their practical applications (Lampeka & Tsymbal, 2004; Suh & Moon, 2007; Suh *et al.*, 2012; Stackhouse & Ma, 2018). Complexes of the 14-membered tetraaza cyclam ligand (cyclam = 1,4,8,11-tetraazacyclotetradecane,  $C_{10}H_{24}N_4$ , *L*), which is the most suitable for binding of 3d transition-metal ions, in particular,  $Ni^{2+}$ , are among popular metal-containing nodes in the formation of MOFs. Their interactions with different oligocarboxylates as the most common bridging ligands (Rao *et al.*, 2004) usually result in coordination polymers, the dimensionalities of which are dependent on the number of carboxylic groups present in the linker. As was shown formerly for a number of macrocyclic  $Ni^{2+}$  complexes

of aza- and diazacyclam derivatives, which are the closest structural analogues of *L* (azaclam = 1,3,5,8,12-pentatetraazacyclotetradecane, diazacyclam = 1,3,5,8,10,12-hexaaazacyclotetradecane), the coordination of the simplest tridentate aromatic ligand benzene-1,3,5-tricarboxylate ( $\text{btc}^{3-}$ ) in the *trans*-axial coordination positions of the metal ion leads to the formation of two-dimensional coordination polymers with hexagonal nets of  $6^3$  topology (Choi *et al.*, 2001; Meng *et al.*, 2011; Choi & Suh, 1998; Ryoo *et al.*, 2010; Lu *et al.*, 2001; Lu *et al.*, 2002; Lampeka *et al.*, 2012). Surprisingly, for the  $\text{Ni}(L)^{2+}$  cation itself, only ionic compounds built on the *trans*-diaqua  $[\text{Ni}(L)(\text{H}_2\text{O})_2]^{2+}$  cation and the non-coordinated  $\text{btc}^{3-}$  anion have been described to date (Choi *et al.*, 1999; Parsons *et al.*, 2006; Tadokoro *et al.*, 2015).

The present work describes the preparation and structural characterization of the first representatives of polymeric complexes formed by  $\text{Ni}(L)^{2+}$  and the benzene-1,3,5-tricarboxylate anion, namely, *catena*-poly[[[(1,4,8,11-tetraazacyclotetradecane- $\kappa^4N^1,N^4,N^8,N^{11}$ )nickel(II)]- $\mu_2$ -5-carboxybenzene-1,3-dicarboxylato- $\kappa^2O^1,O^3$ ] octahydrate],  $[\{\text{Ni}(\text{C}_9\text{H}_4\text{O}_6)(\text{C}_{10}\text{H}_{24}\text{N}_4)\}\cdot 8\text{H}_2\text{O}]_n$  (**I**) and *catena*-poly[[[(1,4,8,11-tetraazacyclotetradecane- $\kappa^4N^1,N^4,N^8,N^{11}$ )nickel(II)]- $\mu_2$ -5-carboxybenzene-1,3-dicarboxylato- $\kappa^2O^1,O^3$ ] monohydrate],  $[\{\text{Ni}(\text{C}_9\text{H}_4\text{O}_6)(\text{C}_{10}\text{H}_{24}\text{N}_4)\}\cdot \text{H}_2\text{O}]_n$  (**II**).

## 2. Structural commentary

The molecular structures of **I** and **II** are shown in Fig. 1. The asymmetric unit of **I** consists of a macrocyclic  $[\text{Ni}(L)]^{2+}$  dication, a monoprotonated carboxylate  $\text{Hbtc}^{2-}$  dianion and eight water molecules of crystallization, while the components of **II** are the same dianion, two crystallographically unique centrosymmetric dications and one water molecule of crystallization. The coordination polyhedra of the metal ions in both complexes are very similar: the  $\text{Ni}^{2+}$  ions are coordinated by the four secondary N atoms of the macrocycle *L*, which adopt the most energetically stable *trans*-III (*R,R,S,S*) conformation (Bosnich *et al.*, 1965a; Barefield *et al.*, 1986) in which the five-membered (N—Ni—N bite angles  $\simeq 85^\circ$ ) and six-membered (N—Ni—N bite angles  $\simeq 95^\circ$ ) chelate rings are in *gauche* and *chair* conformations, respectively (Table 1). The O atoms of the carboxylate ligands occupy the axial positions in the coordination spheres of the metal ions, resulting in a tetragonally elongated *trans*- $\text{NiN}_4\text{O}_2$  coordination octahedra

**Table 2**  
Hydrogen-bond geometry ( $\text{\AA}$ ,  $^\circ$ ) for **I**.

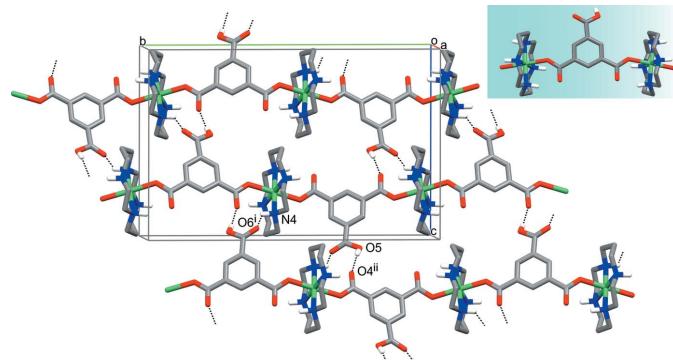

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
O5—H5 $\cdots$ O4 <sup>i</sup>	0.82	1.83	2.604 (3)	157
N2—H2 $\cdots$ O2	0.98	2.08	2.969 (3)	150
N4—H4 $\cdots$ O4 <sup>ii</sup>	0.98	2.00	2.891 (3)	151
N4—H4 $\cdots$ O6 <sup>iii</sup>	0.98	2.59	3.226 (4)	123

Symmetry codes: (i)  $x + \frac{1}{2}, -y + \frac{1}{2}, z + \frac{1}{2}$ ; (ii)  $-x + \frac{3}{2}, y + \frac{1}{2}, -z + \frac{3}{2}$ ; (iii)  $-x + 2, -y + 1, -z + 2$ .

with the Ni—N bond lengths (average value 2.063  $\text{\AA}$ ) slightly shorter than the Ni—O ones (average value 2.121  $\text{\AA}$ ) (Table 1). The axial Ni—O bonds are nearly orthogonal to the  $\text{NiN}_4$  planes (deviations of the angles N—Ni—O from  $90^\circ$  do not exceed  $5^\circ$ ). The deviations of the Ni and N atoms from the mean  $\text{N}_4$  plane in **I** are 0.011  $\text{\AA}$  and  $\pm 0.009 \text{\AA}$ , respectively, while the  $\text{NiN}_4$  coordination moieties in **II** are strictly planar because of the location of the metal ions on crystallographic inversion centers. As in other complexes of the  $\text{Ni}^{2+}$  macrocyclic cations and carboxylate ligands (Tsymbal *et al.*, 2021) the Ni—O bonds in **I** and **II** are reinforced by the intramolecular hydrogen bonds between the secondary NH atoms and the non-coordinated O atoms of each coordinated carboxylic group (Fig. 1, Tables 2 and 3).

The C—O bond lengths in the deprotonated carboxylate groups are nearly equal, thus indicating essential electron delocalization, while protonated carboxylic groups remain non-delocalized [the lengths of the C—OH and C=O bonds in **I** and **II** are 1.305 (4) and 1.200 (3)  $\text{\AA}$  and 1.314 (4) and 1.205 (3)  $\text{\AA}$ , respectively]. The mean planes of the carboxylate groups are slightly tilted relative to the mean plane of their attached aromatic rings (average angle equals  $7.0^\circ$  in **I** and  $16.0^\circ$  in **II**).

In both complexes, the monoprotonated carboxylate ligands display a  $\mu_2$ -bis-monodentate bridging function of the isophthalate type, resulting in the formation of one-dimensional coordination polymers (Figs. 2 and 3). The Ni—O coordination bonds of the Hbtc<sup>2-</sup> bridge are characterized by the *syn/syn* orientation. Since the carboxylate groups are

O1W—H1WB $\cdots$ O4 <sup>v</sup>	0.85	1.92	2.747 (3)	165

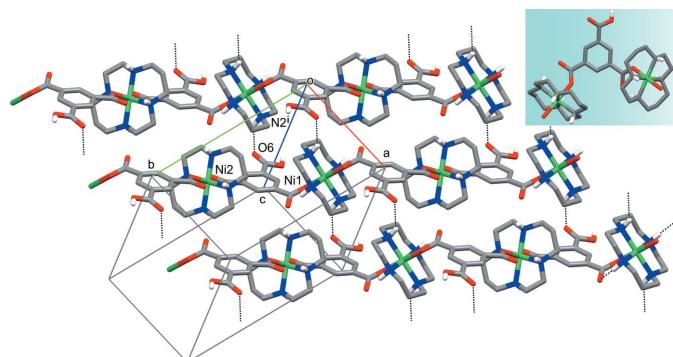

Symmetry codes: (i)  $x + 1, y, z$ ; (ii)  $-x, -y + 1, -z + 1$ ; (iii)  $-x + 1, -y, -z + 1$ ; (iv)  $-x + \frac{1}{2}, y - \frac{1}{2}, -z + \frac{3}{2}$ ; (v)  $-x - \frac{1}{2}, y - \frac{1}{2}, -z + \frac{3}{2}$ .

nearly coplanar with the aromatic rings, the possibility arises for appearance of different modes of ligand coordination, depending on the mutual spatial arrangement of coordinated O atoms (Tsymbal *et al.*, 2021). In the complexes under consideration, these modes can be recognized as remote (rm) in **I** and intermediate (im) in **II** (see insets in Figs. 2 and 3).

Such peculiarities lead to several differences in the structures of the polymeric chains. In particular, the angle between the mean  $\text{NiN}_4$  planes of the macrocyclic cations in **I** is  $40.62 (1)^\circ$ , while they are nearly orthogonal in **II** [ $85.49 (1)^\circ$ ]. Therewith, the chains of the Ni atoms in **I** are non-linear [the angle  $\text{Ni}\cdots\text{Ni}\cdots\text{Ni}$  is  $169.590 (9)^\circ$ ], in contrast to strictly linear metal atom chains in **II**. The most important difference is connected with the mode of the carboxylate coordination and consists of essentially different distances between the Ni atoms in the chains formed by the rm-*syn/syn* coordinated ligand in **I** [ $\text{Ni}\cdots\text{Ni} = 11.0657 (4) \text{\AA}$ ], as compared to the im-*syn/syn* coordinated one in **II** [ $8.9089 (2) \text{\AA}$ ].

### 3. Supramolecular features

Both compounds are characterized by lamellar structures as the result of linking of the polymeric chains into sheets due to hydrogen-bonding interactions (Tables 2 and 3). The key role in the formation of sheets oriented parallel to the  $(10\bar{1})$  plane from the chains running along the  $[010]$  direction in the crystals of **I** is played by the protonated carboxylic group of

**Figure 3**

The hydrogen-bonded (dashed lines) sheet in **II**. C-bound H atoms and water molecule of crystallization have been omitted; the intramolecular hydrogen bonds are not shown. The mode of coordination of carboxylate ligand is shown as an inset. Symmetry code: (i)  $x - 1, y, z$ .

the  $\text{Hbtc}^{2-}$  dianion, which forms two  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds acting both as the proton donor in a strong interaction with the O atom of the coordinated carboxylic ligand on neighboring chain [ $\text{O}5-\text{H}5\cdots\text{O}4(x + \frac{1}{2}, -y + \frac{1}{2}, z + \frac{1}{2})$ ] and as the proton acceptor in a weak interaction with the secondary amino group of the macrocyclic cation belonging to the same neighboring chain [ $\text{N}4-\text{H}4\cdots\text{O}6(-x + 2, -y + 1, -z + 2)$ ] (Fig. 2). There are no hydrogen-bonding contacts between the sheets and the three-dimensional coherence of the crystal is provided by van der Waals interactions.

In the crystal of **II**, polymeric chains with different orientations are present, namely, running along the [110] or [1 $\bar{1}$ 0] directions. As a result of the weak hydrogen bond between the carbonyl O6 atom of the protonated carboxylic group of the acid as the acceptor and the secondary N2—H2 amino group of the macrocyclic cation of a neighboring chain as the donor (Fig. 3), they form alternating sheets oriented parallel to the (001) plane. At the same time, the hydroxyl group of the protonated carboxylate group as the donor interacts strongly with the water molecule of crystallization as acceptor, and this interaction together with two additional hydrogen bonds with participation of O1W molecule results in a three-dimensional network in **II**.

As estimated by *PLATON* (Spek, 2020), the volume of the solvent-accessible voids in **I** in the form of parallel one-dimensional channels equals  $1111\text{ \AA}^3$  (37.5% of the unit-cell volume) and according to SQUEEZE calculations it is filled with eight highly disordered water molecules of crystallization. The crystals of **II** are non-porous.

#### 4. Database survey

The Cambridge Structural Database (CSD, Version 5.43, last update March 2022; Groom *et al.*, 2016) contains descriptions of several polymorphs of compounds containing the  $\text{Ni}(L)$  moiety and the benzene-1,3,5-tricarboxylate anion (refcodes GOQTIP, Choi *et al.*, 1999; PELCOZ, Parsons *et al.*, 2006; GOQTIP01, SABLEP, SABLOZ and SABLOZ01, Tadokoro *et al.*, 2015). All of them are highly hydrated (18–29 water molecules of crystallization) ionic complexes containing the *trans*-diaqua  $[\text{Ni}(L)(\text{H}_2\text{O})_2]^{2+}$  dication and non-coordinated  $\text{btc}^{3-}$  trianions. At the same time, a number of two-dimensional coordination polymers built on parent 14-membered derivatives of  $\text{Ni}(\text{azacyclam})$  (CAXMIZ, Lampeka *et al.*, 2012) and  $\text{Ni}(\text{diazacyclam})$  (IPOZIW, Choi *et al.*, 2001; IWESIN and IWESOT, Meng *et al.*, 2011; JEDQIS and JEDQOY, Choi & Suh, 1998; UJUHUD, Ryoo *et al.*, 2010; VOQSAV, Lu *et al.*, 2001; and WUJDEK, Lu *et al.*, 2002) bearing different substituents at the non-coordinated distal nitrogen atom(s) have been structurally characterized. In addition, two compounds with other structures have been described. One represents the molecular complex in which the *trans*- $[\text{Ni}(L^A)(\text{btc})_2]^{4-}$  anion compensates the charge of the two *trans*- $[\text{Ni}(L^A)(\text{H}_2\text{O})_2]^{2+}$  cations ( $L^A = 3,10\text{-dibutyl-1,3,5,8,10,12-hexaazacyclotetradecane}$ ) (SUXXEQ, Shin *et al.*, 2016), and the other is the hydrated (3.5 water molecules of crystallization) one-dimensional coordination polymer

formed by the  $[\text{Ni}(L^B)]^{2+}$  cation and the  $\mu_2$   $\text{Hbtc}^{2-}$  linker ( $L^B = 1,3,6,9,11,14\text{-hexaazatricyclo[12.2.1.1^{6,9}]octadecane}$ ) (SEFLLOG, Tao *et al.*, 2012). The structure of the latter is similar to the structure of **I** – it is a neutral one-dimensional coordination polymer with parallel alignment of the chains formed due to the carboxylate displaying the rm-syn/syn mode of the bridging function. Correspondingly, the  $\text{Ni}\cdots\text{Ni}$  distance in this compound ( $11.313\text{ \AA}$ ) is close to that observed in **I**, though the chains, in contrast to **I**, are linear.

#### 5. Synthesis and crystallization

All chemicals and solvents used in this work were purchased from Sigma-Aldrich and used without further purification. The complex  $[\text{Ni}(L)](\text{ClO}_4)_2$  was prepared from ethanol solution as described in the literature (Bosnich *et al.*, 1965).

The complex  $[\text{Ni}(L)(\text{Hbtc})\cdot 8\text{H}_2\text{O}]$ , (**I**), was prepared as follows.  $[\text{Ni}(L)](\text{ClO}_4)_2$  (153 mg, 0.33 mmol) and  $\text{H}_3\text{btc}$  (50 mg, 0.24 mmol) were dissolved in 10 ml of a DMF/ $\text{H}_2\text{O}$  mixture (4:1 by volume) and the solution was heated at 358 K for 30 h. A small amount of pink needle-like crystals in the form of concretions was formed in a week. These were filtered off, washed with small amounts of methanol and diethyl ether, and dried in air. Yield: 15 mg (10% based on acid). Analysis calculated for  $\text{C}_{19}\text{H}_{44}\text{N}_4\text{NiO}_{14}$ : C 37.36, H 7.27, N 9.18%. Found: C 37.52, H 7.31, N 9.15%. Single crystals of **I** suitable for X-ray diffraction analysis were selected from the sample formed after refrigerating the mother liquor for several days.

Apparently, the complex  $[\text{Ni}(L)(\text{Hbtc})\cdot \text{H}_2\text{O}]$ , (**II**), is more thermodynamically stable than **I** and it was prepared according to similar procedure, except that initially precipitated crystals were left to remain under the mother liquor at ambient temperature. Over *ca* one week, the needle-like crystals of **I** dissolved; instead, a precipitate in the form of rhomb-shaped plates was formed and single crystals of **II** suitable for X-ray diffraction analysis were selected from this reaction mixture. Alternatively, larger amounts of **II** can be obtained using an analogous procedure but using higher concentrations of the reagents.  $[\text{Ni}(L)](\text{ClO}_4)_2$  (200 mg, 0.44 mmol) and  $\text{H}_3\text{btc}$  (65 mg, 0.31 mmol) were dissolved in 10 ml of a DMF/ $\text{H}_2\text{O}$  mixture (4:1 by volume) and the solution was heated at 358 K for 24 h. After cooling of the reaction mixture, the product began to crystallize in several hours in the form of pink plate-like concretions. It was filtered off, washed with small amounts of methanol and diethyl ether, and dried in air. Yield: 38 mg (25% based on acid). Analysis calculated for  $\text{C}_{19}\text{H}_{30}\text{N}_4\text{NiO}_7$ : C 47.09, H 6.24, N 11.57%. Found: C 47.15, H 6.31, N 11.65%.

**Caution!** Perchlorate salts of metal complexes are potentially explosive and should be handled with care.

#### 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 4. The H atoms in **I** and **II** were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C—H distances of  $0.93\text{ \AA}$

**Table 4**

## Syntheses and structural characterizations of the first coordination polymers assembled from the Ni(cyclam)<sup>2+</sup> cation and the benzene-1,3,5-tricarboxylate linker

Sergey P. Gavrish, Sergiu Shova and Yaroslaw D. Lampeka

### Computing details

For both structures, data collection: *CrysAlis PRO* (Rigaku OD, 2021); cell refinement: *CrysAlis PRO* (Rigaku OD, 2021); data reduction: *CrysAlis PRO* (Rigaku OD, 2021); program(s) used to solve structure: *SHELXS* (Sheldrick, 2015a); program(s) used to refine structure: *SHELXL2018/3* (Sheldrick, 2015b); molecular graphics: *Mercury* (Macrae *et al.*, 2020); software used to prepare material for publication: *publCIF* (Westrip, 2010).

**catena-Poly[[[(1,4,8,11-tetraazacyclotetradecane- $\kappa^4N^1,N^4,N^8,N^{11}$ )nickel(II)]- $\mu_2$ -5-carboxybenzene-1,3-dicarboxylato- $\kappa^2O^1:O^3$ ] octahydrate] (I)**

### Crystal data

[Ni(C<sub>9</sub>H<sub>4</sub>O<sub>6</sub>)(C<sub>10</sub>H<sub>24</sub>N<sub>4</sub>)]·8H<sub>2</sub>O  
 $M_r = 467.16$   
Monoclinic,  $P2_1/n$   
 $a = 9.3650$  (6) Å  
 $b = 22.0401$  (8) Å  
 $c = 14.3567$  (7) Å  
 $\beta = 91.457$  (5)°  
 $V = 2962.3$  (3) Å<sup>3</sup>  
 $Z = 4$

$F(000) = 984$   
 $D_x = 1.047$  Mg m<sup>-3</sup>  
Mo  $K\alpha$  radiation,  $\lambda = 0.71073$  Å  
Cell parameters from 3816 reflections  
 $\theta = 1.9\text{--}23.7^\circ$   
 $\mu = 0.69$  mm<sup>-1</sup>  
 $T = 293$  K  
Prism, clear light pink  
0.40 × 0.20 × 0.10 mm

### Data collection

Rigaku Xcalibur Eos  
diffractometer  
Radiation source: fine-focus sealed X-ray tube,  
Enhance (Mo) X-ray Source  
Graphite monochromator  
Detector resolution: 16.1593 pixels mm<sup>-1</sup>  
 $\omega$  scans  
Absorption correction: multi-scan  
(CrysAlis PRO; Rigaku OD, 2021)

$T_{\min} = 0.751$ ,  $T_{\max} = 1.000$   
21516 measured reflections  
6875 independent reflections  
3858 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.058$   
 $\theta_{\max} = 29.3^\circ$ ,  $\theta_{\min} = 2.6^\circ$   
 $h = -11 \rightarrow 11$   
 $k = -27 \rightarrow 27$   
 $l = -18 \rightarrow 17$

### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.059$   
 $wR(F^2) = 0.125$   
 $S = 1.08$   
6875 reflections  
272 parameters  
0 restraints  
Primary atom site location: dual  
Hydrogen site location: inferred from  
neighbouring sites  
H-atom parameters constrained

$$w = 1/[\sigma^2(F_o^2) + (0.0348P)^2]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.31 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.32 \text{ e \AA}^{-3}$$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

*Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\text{\AA}^2$ )*

*Crystal data*

$M_r = 485.18$

Monoclinic,  $P2_1/n$

$a = 9.3852 (3)$  Å

$b = 15.1459 (4)$  Å

$c = 15.7561 (5)$  Å

$\beta = 98.604 (3)^\circ$

$V = 2214.49 (12)$  Å<sup>3</sup>

$Z = 4$

$F(000) = 1024$

$D_x = 1.455$  Mg m<sup>-3</sup>

Mo  $K\alpha$  radiation,  $\lambda = 0.71073$  Å

Cell parameters from 3646 reflections

$\theta = 2.4\text{--}25.9^\circ$

$\mu = 0.92$  mm<sup>-1</sup>

$T = 293$  K

Prism, clear light pink

0.20 × 0.20 × 0.07 mm

*Data collection*

Rigaku Xcalibur Eos  
diffractometer

Radiation source: fine-focus sealed X-ray tube,  
Enhance (Mo) X-ray Source

Graphite monochromator

Detector resolution: 16.1593 pixels mm<sup>-1</sup>

$\omega$  scans

Absorption correction: multi-scan  
(CrysAlis PRO; Rigaku OD, 2021)

$T_{\min} = 0.988, T_{\max} = 1.000$

14088 measured reflections

4534 independent reflections

2876 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.042$

$\theta_{\max} = 26.4^\circ, \theta_{\min} = 1.9^\circ$

$h = -9 \rightarrow 11$

$k = -16 \rightarrow 18$

$l = -19 \rightarrow 19$

*Refinement*

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.045$

$wR(F^2) = 0.108$

$S = 1.03$

4534 reflections

287 parameters

0 restraints

Primary atom site location: dual

Hydrogen site location: mixed

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0401P)^2 + 0.0138P]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.32$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.43$  e Å<sup>-3</sup>

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
