Received 3 June 2009; accepted 10 June 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.045;  $wR$  factor = 0.156; data-to-parameter ratio = 17.7.

The title compound,  $C_{20}H_{19}F_2NO$ , exists in a twin-chair conformation with an equatorial orientation of the two 2-fluorophenyl groups on both sides of the secondary amine group. The benzene rings are orientated at an angle of  $25.68(4)^\circ$  with respect to one another and the F atoms point upwards (towards the carbonyl group). The crystal is stabilized by an intermolecular  $\text{N}-\text{H}\cdots\pi$  interaction.

### Related literature

3-Azabicyclononanes are present in numerous naturally occurring diterpenoid/norditerpenoid alkaloids and display broad-spectrum biological activity, see: Hardick *et al.* (1996); Jeyaraman *et al.* (1981); For related structures, see: Parthiban *et al.* (2008a,b, 2009); Parthiban, Ramkumar, Kim *et al.* (2008); Parthiban, Ramkumar, Santan *et al.* (2008); Parthiban, Thirumurugan *et al.* (2008). P. Parthiban, V. Ramkumar and Y. T. Jeong

### Comment

3-Azabicyclononanes are important class of heterocycles due to their presence in numerous naturally occurring diterpenoid/norditerpenoid alkaloids and broad spectrum biological activities (Jeyaraman & Avila, 1981; Hardick *et al.*, 1996). Since the stereochemistry plays crucial role in exploiting biological activities, it is essential to establish the stereochemistry of the bio-active molecules. Irrespective of the nature and position of the substituents on the phenyl, similar compounds show twin-chair conformation (Parthiban *et al.* (2008a,b, 2009; Parthiban, Ramkumar, Kim *et al.* (2008), Parthiban, Ramkumar, Santanet *et al.*, 2008; ; Parthiban, Thirumurugan *et al.*, 2008). However, to explore the impact of fluorine atom, substituted at *ortho* position of the phenyl groups on both sides of the hetero atom, we have carried out the single-crystal x-ray diffraction study for the title compound.

The title compound C<sub>20</sub>H<sub>19</sub>F<sub>2</sub>NO, (I), exists in twin-chair conformation with equatorial orientation of the *ortho*-fluorophenyl group on both sides of the secondary amino group with the torsion angle of C8—C2—C1—C9 and C8—C6—C7—C15 as 179.99 (3) and 179.48 (4) $^{\circ}$ , respectively. The aryl groups are orientated at an angle of 25.68 (4) $^{\circ}$  to each other. In both aryl groups, the F atom is pointed towards the carbonyl group (Figure 1.). Analysis of torsion angles, asymmetry parameters and least-squares plane calculation shows that the piperidine ring adopts near ideal chair conformation with the deviation of ring atoms N1 and C8 from the C1/C2/C6/C7 plane by -0.654 (3) Å and 0.696 (3) Å, respectively; Q<sub>T</sub> = 0.6002 (18) Å, q(2)= 0.0242 (17) Å, q(3)=-0.5996 (18) Å,  $\theta$  = 177.54 (16) $^{\circ}$  whereas the cyclohexane ring atoms C4 and C8 deviate from the C2/C3/C5/C6 plane by -0.529 (4) Å and 0.727 (3) Å, respectively; Q<sub>T</sub> = 0.565 (2) Å, q(2)= 0.146 (2) Å, q(3)= -0.546 (2) Å,  $\theta$  = 165.1 (2) $^{\circ}$  (Cremer & Pople, 1975). Hence, the title compound (I) shows appreciable deviation from the ideal chair conformation of the cyclohexane moiety. The crystal structure is stabilized by intermolecular N—H··· $\pi$  interaction (Figure 2.).

### Experimental

A mixture of cyclohexanone (0.025 mol, 2.45 g) and *ortho*-fluorobenzaldehyde (0.05 mol, 6.21 g) was added to a warm solution of ammonium acetate (0.04 mol, 3.08 g) in 30 ml of absolute ethanol. The mixture was gently warmed with stirring till the yellow color was formed during the mixing of the reactants and then stirred at room temperature up to the formation of product. At the end, the crude azabicyclic ketone was separated by filtration and washed with 1:5 ethanol-ether mixture to remove the coloring impurities. Recrystallization of the compound from acetone gave X-ray diffraction quality crystals of 2,4-bis(2-fluorophenyl)-3-azabicyclo[3.3.1]nonan-9-one.

### Refinement

Nitrogen H atoms were located in a difference Fourier map and refined isotropically. Other hydrogen atoms were fixed geometrically and allowed to ride on the parent carbon atoms, with aromatic C—H = 0.93 Å, aliphatic C—H = 0.98 Å and

## supplementary materials

---

methylene C—H = 0.97 Å. The displacement parameters were set for phenyl, methylen and aliphatic H atoms at  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

221 parameters	$\Delta\rho_{\min} = -0.20 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)

are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
