Received 10 October 2011; accepted 13 October 2011

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.023; wR factor = 0.063; data-to-parameter ratio = 10.6.

The title compound, $[Cd(C_8H_4O_5)(H_2O)_3]_n$, a one-dimensional chain complex of 5-hydroxyisophthalate with Cd^{II} , was prepared by a hydrothermal reaction. The Cd^{II} ion is coordinated by three water O atoms and three carboxylate O atoms of two different 5-hydroxyisophthalate ligands, which act as bidentate and monodentate ligands. The crystal structure is stabilized by $O-H \cdots O$ hydrogen bonds.

Comment

The rational design and construction of coordination polymers has attracted much attention owing to their intriguing topologies and potential applications as functional materials (Inoue *et al.*, 2001). Benzenedicarboxylates and their derivatives have been extensively employed to link metal ions in the synthesis of one-, two- or three-dimensional structures. They often act as bridging or chelating ligands (Xiao *et al.*, 2004; Plater *et al.*, 2001). In continuation of our study of the chemistry of benzenedicarboxylate ligands (Zhao *et al.*, 2011), we present here the title compound, in which the 5-hydroxyisophthalate dianion functions as a bridge between adjacent Cd^{II} centers. In the title compound, [Cd(C₈H₄O₅)(H₂O)₃]_n, Cd^{II} ion is hexacoordinated in a distorted octahedral geometry by three O atoms from two organic ligands and three water molecules (Fig. 1). Each ligand bridges two Cd^{II} ions, that results in formation of polymeric zigzag chains extended along the direction [001] (Fig. 2). The crystal packing is stabilized by extensive O–H...O hydrogen bonds (Table 1).

Experimental

A mixture of 5-hydroxyisophthalic acid (0.0182 g, 0.1 mmol), Cd(CH₃COO)₂·2H₂O (0.0266 g, 0.1 mmol), water (8 mL) was stirred vigorously for 30 min and then sealed in a Teflon-lined stainless-steel autoclave. The autoclave was heated and maintained at 413 K for 3 days, and then cooled to room temperature at 5 K h⁻¹ to obtain colorless prism crystals suitable for X-ray analysis.

Refinement

All H-atoms bonded to C were positioned geometrically and refined using a riding model with C–H = 0.93 Å, $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ for aromatic hydrogen atoms. The H-atoms bonded to O were located in a difference Fourier map and their coordinates were refined. The O–H distance was restrained to with O–H = 0.86 (1) Å and the H...H distances in the water molecules to 1.39 (1) Å. $U_{\text{iso}}(\text{H})$ was set to 1.5 $U_{\text{eq}}(\text{O})$.

Figures

Fig. 1. An ORTEP representation of the structure of the title compound showing the atomic numbering and 50% probability displacement ellipsoids [symmetry code: A: $-x + 1/2, -y + 1, z - 1/2$].

Fig. 2. A portion of polymeric zigzag chain in the title compound. H atoms are omitted for clarity.

	Extinction coefficient: 0.0042 (2)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
