Abstract

The descriptive biology of torrent mites (Parasitengona: Torrenticolidae: Torrenticola) of North America (north of Mexico) is investigated using integrative methods. Material examined includes approximately 2,300 specimens from nearly 500 localities across the United States and Canada, and a few collections in Mexico and Central America. Species hypotheses are derived from a phylogenetic analysis of the barcoding region of cytochrome c oxidase subunit 1 (COI) for 476 specimens and supported with morphology and biogeography. Relationships between species are examined with a combined analysis of COI and two expansion regions (D2-3) of the large ribosomal subunit (28S rDNA) for 57 specimens. All previously described species from the US and Canada are examined. Our results indicate the need to synonymize four species: T. mercedensis (Marshall, 1943) is a junior synonym of T. sierrensis (Marshall, 1943); T. rectiforma Habeeb, 1974 is a junior synonym of T. ellipsoidalis (Marshall, 1943); T. neoconnexa Habeeb, 1957 is a junior synonym of T. magnexa Habeeb, 1955; and T. esbelta Cramer, 1992 is a junior synonym of T. boettgeri KO Viets, 1977. We describe 66 new species and re-describe all previously described regional species. Our findings indicate that total diversity of Torrenticola in the United States and Canada comprises 90 species, 57 known from the east and 33 from the west. We organize these species into four species complexes that include 13 identification groups. An additional 13 species do not fit within an identification group. The southern Appalachians are suspected to contain the highest concentration of remaining undescribed diversity. A key is provided to all known species in the US and Canada.

Introduction

Torrenticolidae Piersig, 1902 are known as "torrent mites" due to the typical habitat of most species—fast-flowing, rocky or sandy-bottom streams (Goldschmidt 2007, Smith et al. 2010, Proctor et al. 2015). In fact, in many streams, torrenticolids are among the most abundant of all arthropods. Adults are active predators that crawl through sandy sediment with stout legs and sclerotized bodies and roam interstitial zones in search of micro-crustaceans (Goldschmidt 2007, Smith et al. 2010, Proctor et al. 2015). The dorsal cuticle of adults is often ornamented with colorful patterns that can be useful in differentiating species, especially locally (Figure 1). Larvae are ectoparasites of chironomids, but cannot yet be identified to the species-level, so questions such as host specificity and loss of parasitism remain open areas of investigation. This difficulty is compounded by the fact that larval and post-larval stages are difficult to link due to disparate morphologies, although future efforts employing molecular techniques may resolve this issue (e.g., Stålstedt et al. 2016).

Torrenticolidae comprises two subfamilies (Wiles 1997): Testudacarinae Cook, 1974 and Torrenticolinae Piersig, 1902. Testudacarinae comprises two genera (O'Neill et al. 2016)—*Debsacarus* Habeeb, 1961 (one species) and *Testudacarus* Walter, 1928 (20 species)—and Torrenticolinae comprises five genera: *Monatractides* Viets, 1926 (approximately 100 species); *Neoatractides* Lundblad, 1941 (11 species); *Pseudotorrenticola* Walter, 1906 (eight species); *Stygotorrenticola* Pešić & Gerecke, 2014

Figure 1. Diversity of *Torrenticola* in Ouachita National Forest, Arkansas. Species from top-left to bottom-right: *T. irapalpa* sp. n., *T. interiorensis* sp. n., *T. biscutella* sp. n. female, *T. biscutella* sp. n. male, *T. pearsoni* sp. n., *T. trimaculata* Fisher & Dowling 2016, *T. unimaculata* sp. n., *T. larvata* Cherri et al. 2016, *T. solisorta* sp. n. Note that, for a given locality, many characters necessary for identification can be seen under low magnification. For example, species in the bottom row can be readily differentiated using color pattern. In contrast, species in the top row have similar color patterns; however, even they can be readily identified: *T. irapalpa* have dorsal glandularia (Dgl-4) closer together than the other species and *T. biscutella* have fused anterio-lateral platelets and strong sexual dimorphism (neither character is present in *T. interiorensis*). Only the identification of *T. interiorensis* is tentative based on this image, because *T. neoanomala* (not pictured), which are also found in this locality, can only be differentiated from *T. interiorensis* by comparing precise measurements of the anterio-lateral platelets, necessitating examining slide-prepared material under higher magnification. Also, note that some species can appear differently than what is depicted in species descriptions. For example, although *T. pearsoni* sp. n. has a nearly colorless cuticle, it can appear dark due to gut contents, as shown here. Image is a composite of stacked images from a Samsung GS7 and edited in Adobe Photoshop.

(one species); and *Torrenticola* Piersig, 1896 (approximately 250 species, not including species described herein).

Torrenticola—the focus of this paper—are found worldwide, excepting Antarctica. In North America, 79 species have been described, most of which are known from Central America due to the efforts of Goldschmidt (2007). North of Mexico, only 23 *Torrenticola* have been described (Marshall 1929, 1930, 1933, 1943; Habeeb 1955, 1957, 1961, 1973, 1974; Crowell 1960; Fisher et al. 2015; and Cherri et al. 2016) and no comprehensive review is available. Most species are known from only one or a few specimens and sampling has been greatly limited.

The present study is the fourth in a series of ongoing taxonomic investigations of North American Torrenticolidae. The first study offered a detailed description of a single species, diagnoses of higher ranks, and a historical review (Fisher et al. 2015);

the second investigated the systematics of Testudacarinae (O'Neill etal. 2016); and the third allowed an undergraduate researcher to describe a species endemic to the Ouachita Mountains, USA (Cherri et al. 2016). Herein, we describe 66 new species and redescribe 24 species, totaling 90 species. The ability to efficiently test species boundaries of such a widespread and diverse genus is a feat made possible with molecular data and by the researchers who contributed to the immense holdings of the Canadian National Collection (CNC), especially Ian Smith, who collected fresh material for molecular analyses. These collections were supplemented with local collections in Arkansas and four expeditions (Rocky Mountains, Pacific Northwest, California, and Alaska).

Methods

Curation: Mites were collected and curated using the protocol detailed by Proctor et al. (2015, p. 649–655) and summarized by Fisher et al. (2015). Specimens collected for molecular analyses were preserved in 95% ethanol, whereas others were preserved in GAW (50% glycerol, 10% glacial acetic acid, and 40% water by volume; also referred to as Koenike's solution). Slide preparations were created after extraction of genomic DNA (see Molecular phylogenetics below) using either glycerin jelly or Hoyer's medium. Where available, holotypes and allotypes were designated with glycerin jelly slide preparations, rather than Hoyer's slide preparations. Unlike Hoyer's, glycerin jelly does not obliterate body coloration, which can be important in identifying many *Torrenticola*. However, Hoyer's medium has superior optical properties, which enables investigations at higher magnification (i.e., greater than 400×). Therefore, when available, some paratypes were prepared with Hoyer's medium.

Geographic coverage: North America, north of Mexico (Figure 2). Importantly, Alaska, which is not represented in Figure 2, was sampled for water mites, but no Torrenticolidae were found. Similarly, the Great Plains region was sampled, but few *Torrenticola* specimens were found. These regions likely represent areas where *Torrenticola*, which appear to prefer cool, clean, mountainous streams, are not present or at least not common.

Terminology: We follow the terminology of Fisher et al. (2015), who modified Goldschmidt (2007) and Proctor et al. (2015), with the addition of a new term, "anterior venter", used to describe the distance between the gnathosomal bay to the genital field (Figure 6C). Colorful species generally have dorsal shades that ranges from bluish to orangish, and a medial stripe that ranges from orangish to reddish. We use the following terminology regarding the darker shade: navy blue – bluish-purple – purple – reddish-purple – orange (Figure 3).

Images: Color micrographs of slide preparations were taken with a Leica DFC 300× camera using Leica Application Suite software and montaged with Helicon Focus 6 to ensure certain structures (e.g., glandularia) were visible. Resulting image stacks were then edited in Adobe Photoshop CS6 to remove debris, repair damaged specimens, and remove structures that are unnecessary for identification. For the latter,

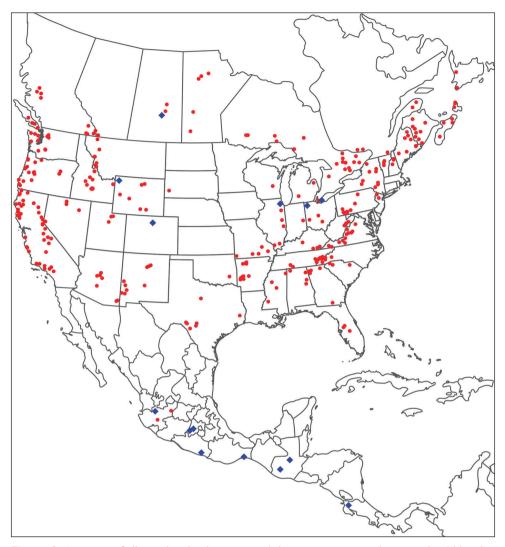

Figure 2. Summary of all sampling localities. 327 red dots represent material examined; 14 blue diamonds represent published accounts where material was not available for direct examination. Each of the 341 localities represent a generalized locality, not an individual collection event, as multiple events often occured in close proximity. In total, this map represents nearly 500 collection events. Note the absence of material from the Great Plains (e.g., Oklahoma, Kansas, Nebraska, and the Dakotas) and Alaska; these are areas that were sampled for water mites, but *Torrenticola* were not found.

legs were removed from the venter and most setae were removed from the pedipalp. In addition to these structures not being useful for identification, they are also not depicted accurately with photographs. Final images were compared with the specimen and edited accordingly to best approximate realistic coloration. In some cases, specimens prepared in glycerin jelly (i.e., coloration preserved) were not available and

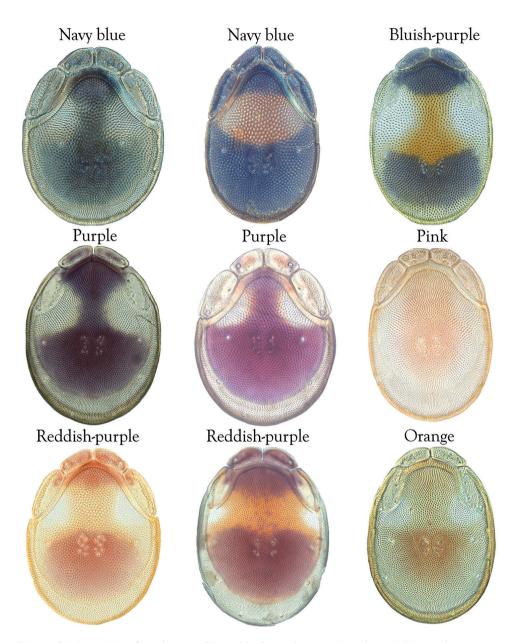

Figure 3. Terminology for coloration: blue – bluish-purple – purple-pink – reddish-purple – orange. Species depicted from top-left to bottom-right: *T. gorti; T. erectirostra; T. biscutella; T. neoanomala; T. ni-groalba; T. gorti; T. skvarlai; T. magnexa*, and *T. delicatexa*.

only the Hoyer's slide preparations (i.e., coloration destroyed) were available. For these, micrographs were taken of the Hoyer's slides and coloration was added in Photoshop (Figure 69, 71). Note that color micrographs depict the best representation of specific

characters (venter, dorsum, pedipalp, subcapitulum), so a given figure may be a composite of multiple specimens (e.g., dorsum and subcapitulum of specimen A; venter of specimen B).

Descriptions: The descriptions contained herein are streamlined to include information that best diagnoses a given species, so we depart from the standard of previous descriptions in two important ways. First, we depict species with photomicrographs rather than line drawings, which greatly reduces the time necessary for a given description. Although this is not generally possible with mites, torrenticolids lend themselves to such representation because the characters needed to diagnose species, such as color pattern, are viewable from such images-a condition not common in most mite groups. Second, we depart from the suggestion of Goldschmidt (2007) and recent torrenticolid descriptions (e.g., Pešić 2014; Pešić and Gerecke 2014; Pešić and Smit 2014) in that we do not depict the ejaculatory complex or legs as these systems were not useful in differentiating species that were easily distinguished by other systems (e.g., color, various measurements and proportions). In fact, in those cases where two or more species were difficult to differentiate using our methods (e.g., Miniforma Group), we examined the ejaculatory complex and legs for additional characters. However, in no case could species that are difficult to identify be separated by ejaculatory complex or leg character systems. Therefore, although such systems are morphologically interesting, we decline to describe them here.

Species delimitation: An integrative approach to species delimitation was employed, which included a combination of morphological, molecular, and biogeographic characters. The development of species hypotheses was an iterative process. Initial hypotheses were created during the sorting stage with a stereomicroscope by grouping specimens into recognizable units of overall similarity (i.e., morphotypes). These hypotheses were tested with early iterations of phylogenetic analyses, which was the basis for identifying preliminary clades in need of further sampling. For example, distinctive morphotypes recovered as monophyletic, and with low genetic variability across their distribution (i.e., less than one percent difference in COI), were considered as putative species; additional specimens were not added unless found far outside the known geographic range. In contrast, when morphotypes were found to span multiple clades in COI trees, additional specimens from those lineages were included to generate more data in order to test hypotheses for those morphologically cryptic clades.

Measurements (Figure 4–6): We generally follow Fisher et al. (2015), who modified Goldschmidt (2007), but with the following modifications. Two measurements were added: the distance between Dgl-4 and the height of the rostrum. The following measurements were excluded as they were not found to be important in diagnosing species: distance from genital field to excretory pore; distance from genital field to cauda; dorsal plate length; gnathosomal bend depth; cheliceral height; width of palpomeres, except for the tibia; and all genital skeleton measurements. For each species, when available, a minimum of five individuals of each sex were measured. An effort was made to include members that spanned the range of variability (morphological and molecular) from across the geographic range.

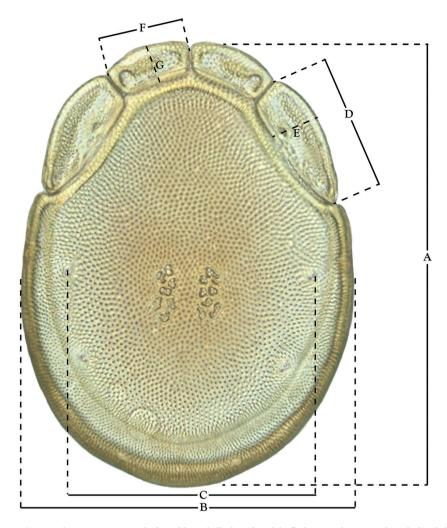

Figure 4. Dorsal measurements: **A** dorsal length **B** dorsal width **C** distance between dorsal glandularia, Dgl-4 **D** anterio-lateral platelet length **E** anterio-lateral platelet width **F** anterio-medial platelet length **G** anterio-medial platelet width. *T. multiforma* Habeeb, 1974 depicted.

To increase time-efficiency, Fisher et al. (2015) suggested digitally measuring compound light micrographs of specimens. However, we abandon that method herein, as many closely-related species of North American *Torrenticola* are identifiable only with precisely-measured ratios. Measurements were found to be highly inaccurate if taken from images that were not in crisp focus. High-quality, stacked images of each structure can negate this problem (e.g., Hamilton et al. 2016). However, creating such images of slide-prepared mites greatly increases the time invested per specimen and was beyond the scope of this study. Therefore, our measurements were taken with an objective micrometer on a Leica DM 2500 compound microscope.

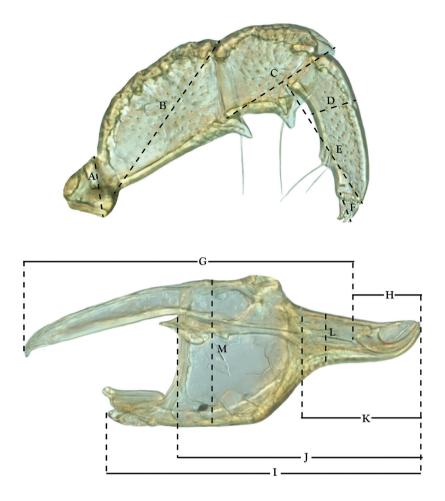

Figure 5. Gnathosomal measurements. Palpomeres – A trochanter length B femur length C genu length
D tibia length E tibia width F tarsus length. Chelicerae – G cheliceral base length H fang length. Subcapitulum – I ventral length J dorsal length K rostrum length L rostrum width M height. *T. multiforma* Habeeb, 1974 depicted.

Molecular phylogenetics: Samples from most sites were sorted to morphotype. Male and female representatives of each morphotype, per sample locality, were chosen for extraction. This resulted in clades containing members from across the geographic range, regardless of our initial speculations on species hypotheses. However, the high abundance of specimens in samples from the far west (California, Oregon, Washington) necessitated that each sample be scanned for morphotypes rather than sorting the entire sample. This was likely sufficient to find most species, but increased the likelihood of missing species present in low abundance. For example, despite obtaining abundant specimens of the Miniforma Group in nearly every sample, we were unable to re-collect *T. miniforma* Habeeb, 1974, even within the type locality.

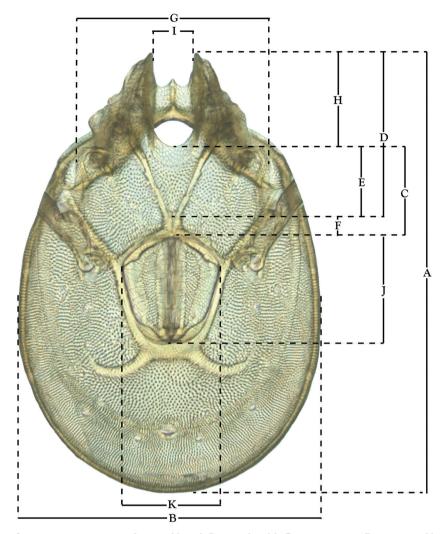

Figure 6. Venter measurements: **A** ventral length **B** ventral width **C** anterior venter **D** coxa-I total length **E** coxa-I medial length **F** medial suture length **G** coxa-III width **H** gnathosomal bay length **I** gnathosomal bay width **J** genital field length **K** genital field width. *T. multiforma* Habeeb, 1974 depicted.

To test species hypotheses and guide the description process, the barcoding region of COI was analyzed. We then used the resulting tree as a guide to increase sampling in certain geographic regions, or within certain morphotypes. The result is that many species are represented by specimens from across their distributions and spanning morphological variation. We also analyzed the D2-3 region of 28S rDNA in combination with COI to resolve relationships between species. This analysis included representatives of every species group. All sequences have been deposited in GenBank and accession numbers are located in Suppl. material 1. We follow the recommendation of Chakrabarty et al. (2013) in using GenSeq nomenclature.

Genomic DNA was extracted using Qiagen DNeasy Tissue Kit (Qiagen Inc., Valencia, Calif.). The target regions of COI (450 bp) and 28S (725 bp) were amplified with LCOI and HCOI (Folmer et al. 1994) and D23F and D6R (Park and Ó Foighill 2000), respectively, and purified with Qiagen QIAquick PCR Purification Kits. Test gels (1.5% agarose) confirmed PCR product quality. Purified PCR products were sequenced by Macrogen USA (Rockville, Maryland). Forward and reverse sequences were reconciled with DNASTAR© Lasergene SeqMan (Madison, Wisconsin). Resulting contigs were checked for contamination with BLASTn searches of NCBI's nr database. Sequences were assessed for the presence of nuclear mitochondrial DNA segments (NUMT) by scanning for in-frame stop codons and indels (Song et al. 2008). COI sequences were aligned with Clustal X (Thompson et al. 1997) and 28S sequences were aligned with MAFFT Version 7 (Katoh and Standley 2013); both alignments were conservatively edited with BioEdit (Hall 1999). Bayesian analyses were performed with MrBayes (3.2.2) using the Extreme Science and Engineering Discovery Environment (XSEDE) infrastructure on the Cipres Portal (Miller et al. 2010), which submits jobs to the Gordon Compute Cluster, a network of 16 supercomputers sponsored by NSF XSEDE at the University of California, San Diego. Each analysis consisted of four simultaneous runs, each with four chains sampling every 1000 generations for 20 million generations, under a GTR+I+F model of molecular evolution; 50,000 trees were discarded as burn-in. The resulting majority-rule consensus trees were viewed with Dendroscope 3 (v. 3.5.7) (Huson and Scornavacca 2012); tree image files were then exported in PDF format and edited for final figures in Adobe Illustrator CS6.

Type designation: Earlier works have suggested that males should be used as holotypes due to the importance of characters of the genital skeleton (e.g., Goldschmidt 2007). At least with North American fauna, this is not the case, as females are often more distinctive than males, especially within difficult-to-identify lineages (e.g., Rusetria Complex). Therefore, we have chosen female specimens for most holotypes. Of all species in the region, only nine have male holotypes. Of these nine, four are only known from males (*T. anoplopalpa* Fisher & Dowling, sp. n.; *T. bittikoferae* Crowell, 1960; *T. dolichodactyla* Fisher & Dowling, sp. n.; and *T. longitibia* Fisher & Dowling, sp. n.) and four were previously described (*T. delicatexa* Habeeb, 1955; *T. neoanomala* Habeeb, 1957; *T. rufoalba* Habeeb, 1955; *T. tricolor* Habeeb, 1957). Only one species (*T. interiorensis* Fisher & Dowling, sp. n.) has been deliberately chosen herein to be represented by a male holotype, which we have done to reflect that this species can only be readily-differentiated from its sister species, *T. neoanomala*, with male characters.

When possible, allotypes (a paratypic member of the opposite sex as the holotype) that best embody the proposed species hypotheses have been selected from the paratypic series. Allotypes are connected to the holotype based upon sampling location, genetic variation, and character consistency. Allotypes are considered to be the best representatives of the paratypic series that are also connected to the holotype with greater confidence than other paratypes.

When possible, the entire type series is represented in our phylogenetic analyses. However, we have found that coloration is valuable for species identification, yet for some lineages a given sex is represented only by specimens preserved in Hoyer's medium, which destroys coloration. To resolve this problem, we searched GAW-preserved material for representatives. These specimens lack molecular data, but in each instance, specimens were selected that adhere to our species hypothesis with high confidence. For example, specimens were preferred if from the same sample or region, and especially from collection events that also lacked similar species.

Deposition: Material examined for both newly-described and previously-described species (holotypes, allotypes, most paratypes, and most other material examined) were deposited in the Canadian National Collection of Insects, Arachnids, and Nematodes (CNC) in Ottawa, Canada. An exception is *T. bittikoferae* Crowell, 1960, for which we examined two paratypes deposited in the Ohio State University Acarology Laboratory (OSAL) collection. For all species, when additional specimens were available, representative paratypes and other material examined were also deposited in the Acari Collection of the University of Arkansas (ACUA) in Fayetteville, Arkansas.

Results and discussion

Summary of material: Approximately 2,300 specimens representing 90 species were examined from nearly 500 localities spanning the United States, Canada, and a few collections in Mexico and Central America (Figure 2). Specimens preserved in ethanol (for morphology and molecular data) and GAW (for morphology alone) were available for most locations across the US and Canada, but only GAW samples were available from Mexico and Central America.

Herein, we discuss 90 species of *Torrenticola* from North America. Previously, 23 species were known from the United States and Canada. Herein we propose the following four synonymies: *T. mercedensis* (Marshall, 1943) is a junior synonym of *T. sierrensis* (Marshall, 1943); *T. rectiforma* Habeeb, 1974 is a junior synonym of *T. ellipsoidalis* (Marshall, 1943); *T. neoconnexa* Habeeb, 1957 is a junior synonym of *T. magnexa* Habeeb, 1955; *T. esbelta* Cramer, 1992 is a junior synonym of *T. boettgeri* KO Viets, 1977. Five species previously known only from Mexico and Central America are reported from the southwestern U.S.: *T. boettgeri* KO Viets, 1977; *T. keesdavidsi* Cramer, 1992; *T. kurtvietsi* Cramer, 1992; *T. lamellipalpis* Viets, 1997; and *T. rala* Cook, 1980. This raises the number of previously described species known from North America north of Mexico to 24. We also describe 66 new species, which raises the total number of species known from the U.S. and Canada to 90. All previously described species are re-described with color images and updated information.

Summary of phylogenetic analyses: A combined dataset of 28S (725 bp) and COI (450 bp) of 42 species (Suppl. material 1) recovered four species complexes (described below) (Figure 7–8). These complexes were determined based upon a combination of monophyly and note-worthy characters (e.g., postero-lateral plate fusion in the Rusetria Complex; short, conical rostrum in the Tricolor Complex). The Rusetria and Raptor Complexes were recovered as closely related with strong support. However, we consider

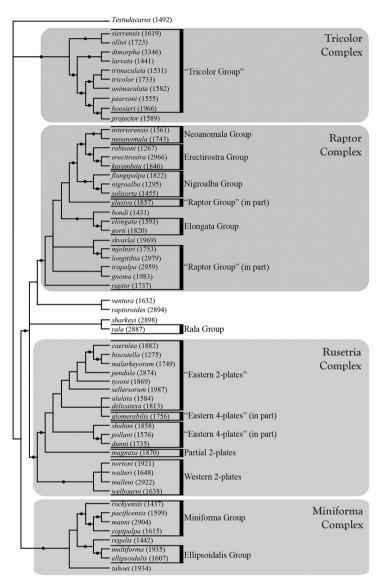

Figure 7. Bayesian inferred cladogram for combined analysis (28S+COI) of North American *Torrenticola*: species complexes and identification groups. Four well-supported complexes are organized into 13 groups that are helpful for identification. Note that 1) not all identification groups are monophyletic (in quotation marks); 2) not all species are placed in a complex; and 3) some species are not placed within a group, reflecting their identification difficulty. Numbers are DNA identification numbers. Dots denote posterior probably >95%.

relationships among species complexes tentative, pending worldwide sampling. Within these complexes, 12 species groups are noted that are helpful for identification (an additional group, the Rala Group, does not fit within a complex), although many of these groups are not monophyletic.

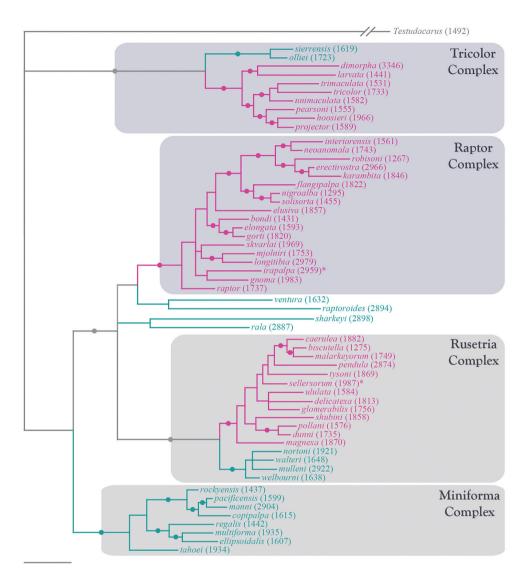

Figure 8. Bayesian inferred phylogram for combined analysis (28S+COI) of North American *Torrenticola*: distributions of 57 species. Pink represents lineages distributed in eastern North America and blue represents lineages distributed in western North America (gray branches represent lineages distributed in both regions). Species marked with an asterisk are primarily eastern but have distributions extending into the west. Note that larger lineages contain species distributed in either the east or west, but not both. Numbers are DNA identification numbers. Scale bar indicates 0.1 substitutions per site. Dots denote posterior probably >95%.

COI sequence data were obtained for 481 individuals from across the United States and Canada (Suppl. material 1), including all specimens from the combined analysis. These 481 individuals group into 57 clades that represent well-supported species hypotheses (Figures 9–18). Of these 57 species hypotheses, 13 clades are identifiable to previously-described species: *T. delicatexa* Habeeb, 1955; *T. ellipsoidalis* (Marshall, 1943); *T. larvata* Cherri, Fisher, & Dowling, 2016; *T. multiforma* Habeeb, 1974; *T. neoanomala* Habeeb, 1957; *T. magnexa* Habeeb, 1955; *T. nigroalba* Habeeb, 1955; *T. projector* Habeeb, 1961; *T. rala* Cook, 1980; *T. sierrensis* (Marshall, 1943); *T. tahoei* (Marshall, 1943), *T. tricolor* Habeeb, 1957, *T. trimaculata* Fisher, 2015; *T. ventura* Habeeb, 1973. Two clades include multiple previously-named species, necessitating the synonymization of three species. Ethanol-preserved specimens of seven previously described species, known from the United States and Canada (*T. bittikoferae* Crowell, 1960; *T. indistincta* (Marshall, 1929); *T. kittatinniana* Habeeb, 1955; *T. miniforma* Habeeb, 1974; *T. occidentalis* (Marshall, 1933); and *T. rufoalba*), were not available, but the type series for each of these were examined morphologically. Of the 57 species in our molecular analysis, 44 represent new species.

Species Complexes and Groups (Table 1): As considered herein, species complexes are monophyletic collections of closely-related species recovered by our combined (COI+28S) phylogenetic analyses (Figure 7–8). In addition, most species known only from morphology are placed within the tree in suspected complexes. Species complexes proposed herein and their relationships to each other should be considered a first step in need of future exploration that will greatly benefit from worldwide sampling. Our analyses recover four species complexes: Miniforma; Raptor; Rusetria; and Tricolor.

Four western species included in the molecular analysis do not fit into a species complex: *T. ventura* Habeeb, 1973; *T. raptoroides* Fisher & Dowling, sp. n.; *T. sharkeyi* Fisher & Dowling, sp. n.; and *T. rala* Cook, 1980. Additionally, fresh material for molecular analysis was not available for six other species that are suspected to be closely related to *T. rala* and therefore included in the Rala Group (below): *T. boettgeri* KO Viets, 1977; *T. kurtvietsi* Cramer, 1992; *T. lamellipalpis* KO Viets, 1977; *T. keesdavidsi* Cramer, 1992; *T. dolichodactyla* Fisher & Dowling, sp. n.; and *T. anoplopalpa* Fisher & Dowling, sp. n. Collectively these species (*T. ventura*, *T. raptoroides*, *T. sharkeyi* and the Rala Group), resemble fauna from south of the US. The phylogenetic affinity of these species can only be determined with the addition of worldwide fauna, especially from Mexico and Central America.

As considered herein, "species groups" represent closely related species that are readily identifiable to the species group level, often even under low magnification (i.e., stereoscope). The function of these species groups is to aid identification, as often species of a group are easier to recognize at the group-level than the species-level. Occasionally, identifying a given specimen to species-level requires merely combining group-level identification with locality. Importantly, four species groups are not monophyletic: Tricolor Group, Raptor Group, Eastern 4-Plates, and Eastern 2-Plates. This is because these species groups serve to ease identification, not to inform relationship. However, despite the utility of learning these species groups, they are meant to merely augment the key. Accurate identification of most species still requires keying slide preparations under higher magnification (i.e., compound microscope) with precise measurements.

Table 1. Distribution of the 90 species of *Torrenticola* from the US and Canada among Species Complexes and Groups. Number of species within a group are denoted parenthetically. Species for which molecular data was available are denoted with an asterisk. Species known only from one sex are denoted with sex symbols (\bigcirc or \bigcirc). Species Groups in quotation marks were **not** recovered as monophyletic in our molecular analyses.

Thirteen species do not fit into species groups. Three of these species are among the most recognizable species in the genus, but are single-species and thus not "groups": *T. arktonyx* Fisher & Dowling, sp. n.; *T. projector* Habeeb, 1961; and *T. tahoei* (Marshall, 1943). Nine of the 13 species are not placed within a species group because they are difficult to identify under lower magnification and have little in common with sister species. The reader is referred to the key and diagnoses for these species: *T. oregonensis* Fisher & Dowling, sp. n.; *T. wiedenmanni* Fisher & Dowling, sp. n.; *T. occidentalis* (Marshall, 1933); *T. raptoroides* Fisher & Dowling, sp. n.; *T. skvarlai* Fisher & Dowling, sp. n.; *T. sharkeyi* Fisher & Dowling, sp. n.; *T. skvarlai* Fisher & Dowling, sp. n.; and *T. ventura* Habeeb, 1973.

The **Rala Group** (Figure 7–9, 11) is the only species group that does not fit within a species complex. This group comprises seven species: *T. boettgeri*; *T. kurtvietsi*; *T. lamellipalpis*; *T. keesdavidsi*; *T. rala*; *T. dolichodactyla*; and *T. anoplopalpa*. These species are colorless and have incomplete or indistinct hind coxal margins. They are southwestern (Arizona, New Mexico, and Texas), with a few extending into Mexico and Guatemala. However, we suspect all seven species extend well into Mexico and perhaps further south, with US populations representing the northern-most extents of their distributions.

Raptor Complex (Figure 7–11): Molecular analyses recovered 19 species in this complex. One of these species, *T. racupalpa* Fisher & Dowling, sp. n., could not be included in the combined dataset, but was included in the COI analysis, where it was recovered as sister to *T. elusiva* Fisher & Dowling, sp. n. Additionally, fresh material for molecular analysis was not available for five other species suspected as being within this complex based upon morphology: *T. danielleae* Fisher & Dowling, sp. n.; *T. daemon* Fisher & Dowling, sp. n.; *T. ivyae* Fisher & Dowling, sp. n.; *T. reduncarostra* Fisher & Dowling, sp. n.; and *T. dentirostra* Fisher & Dowling, sp. n. In total, there are 24 species within the Raptor Complex.

All members of the Raptor Complex are eastern. A collection of western species (*T. raptoroides* Fisher & Dowling, sp. n.; *T. sharkeyi* Fisher & Dowling, sp. n.; T. *ventura* Habeeb, 1973; and the Rala Group) that do not form a monophyletic group, are often recovered as sister to the Raptor Complex. This suggests that the Raptor Complex may have originated from a Neotropical ancestor that dispersed into the eastern US and subsequently diversified. However, this speculation requires worldwide sampling for support.

Basal lineages within the Raptor Complex remain unsupported/unresolved, but a few relationships within the complex were recovered with high support. First, the Erectirostra Group was not recovered as monophyletic in the COI analysis, but is well-supported in the combined analysis. Second, the Neoanomala and Erectirostra Groups are closest relatives; indeed, apart from the apomorphic subcapitulum of the Erectirostra Group, the two groups are otherwise similar. Third, a sister relationship between the Erectirostra + Neoanomala lineage and the Nigroalba Group was recovered with high support. Finally, both analyses support a sister relationship between *T. bondi* Fisher & Dowling, sp. n. and the Elongata Group.

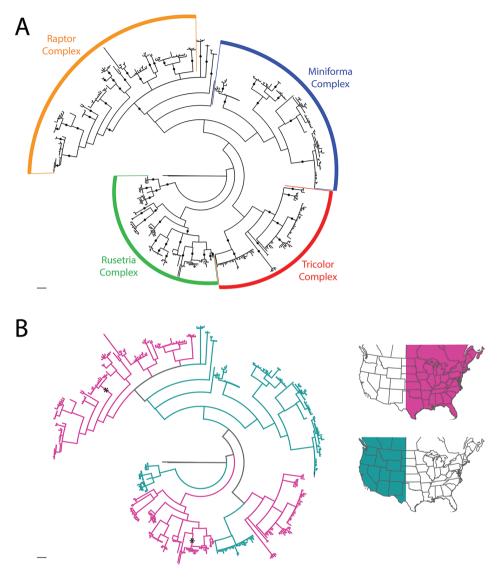

Figure 9. Bayesian inferred circular phylograms of North American *Torrenticola*, COI only. Scale bars indicate 1.0 substitutions per site. **A** Overall tree depicting the four complexes recovered in combined analysis. Dots denote posterior probability >95% **B** Species distributions; branch colors correspond to regions of North America depicted on the right (eastern, pink; western teal). Asterisks denote eastern species that extend into the west. Note that lineages tend to contain species distributed in either the east or west, but not both. Detail of this figure is presented in Figures 10–18.

22 of the 24 species of the Raptor Complex are organized into five species groups: Raptor Group, Elongata Group, Nigroalba Group, Erectirostra Group, and Neoanomala Group. Two species do not fit within an identification group: *T. bondi* Fisher & Dowling, sp. n. and *T. skvarlai* Fisher & Dowling, sp. n.

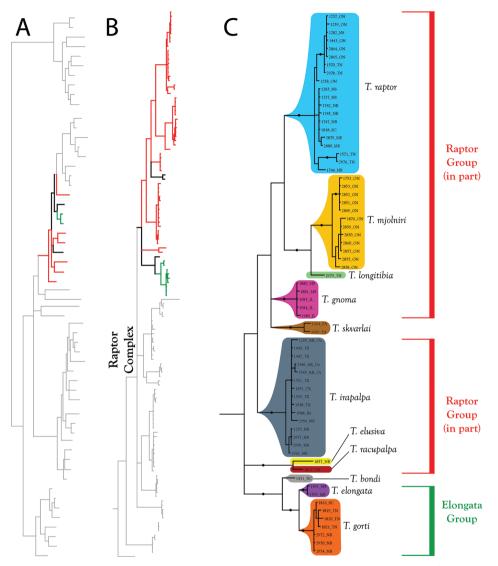

Figure 10. Raptor Complex (part I). These species are eastern, although *T. irapalpa* extends further west. Note that two species (*T. skvarlai* and *T. bondi*) do not fit into identification groups. **A** Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Raptor Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Raptor Complex (in part) from B. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state or territory abbreviation.

The **Raptor Group** (Figure 10) comprises ten eastern species: *T. danielleae* Fisher & Dowling, sp. n.; *T. daemon* Fisher & Dowling, sp. n.; *T. ivyae* Fisher & Dowling, sp. n.; *T. gnoma* Fisher & Dowling, sp. n.; *T. irapalpa* Fisher & Dowling, sp. n.; *T. longitibia* Fisher & Dowling, sp. n.; *T. mjolniri* Fisher & Dowling, sp. n.; *T. elusiva*

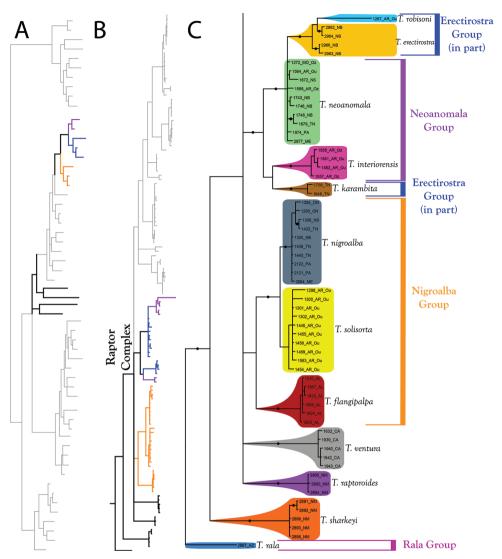

Figure 11. Raptor Complex (part II). Species of the Raptor Complex are eastern, but the species that do not fit into the complex (*T. rala; T. sharkeyi; T. raptoroides; & T. skvarlai*) are western. **A** Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Raptor Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Raptor Complex (in part) from B. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state or territory abbreviation.

Fisher & Dowling, sp. n.; *T. racupalpa* Fisher & Dowling, sp. n.; and *T. raptor* Fisher & Dowling, sp. n. These closely related species are readily identifiable with the following combination of characters: round bodies; Dgl-4 close to muscles scars; long thin subcapitular rostra; and long, thin pedipalp tibiae. This group was not recovered as monophyletic in our analyses; however, relationships within this group are also not well-supported, so neither monophyly nor non-monophyly can be rejected.

The **Elongata Group** (Figure 10) comprises three eastern species: *T. elongata* Fisher & Dowling, sp. n.; *T. reduncarostra* Fisher & Dowling, sp. n.; and *T. gorti* Fisher & Dowling, sp. n. Members of this distinctive group are readily identifiable by the combination of characters: small body size; bold, distinctive coloration; and elongate, ovoid body shape. No other species share this combination of characters. Furthermore, no other *Torrenticola* have similar coloration to the dark morph of *T. gorti* and no other *Torrenticola* are as elongate as *T. elongata*.

The **Nigroalba Group** (Figure 11) comprises four eastern species: *T. flangipal-pa* Fisher & Dowling, sp. n.; *T. dentirostra* Fisher & Dowling, sp. n.; *T. nigroalba* Habeeb, 1955; and *T. solisorta* Fisher & Dowling, sp. n. These closely related species are readily identifiable with the following combination of characters: small body size; long, thin subcapitular rostra and pedipalp tibiae; dorsal purple coloration restricted to posterior half; somewhat elongate bodies; and hind coxal margins that are distinctly present, but the margins of are poorly defined. Several western species can superficially resemble members of the Nigroalba Group under low magnification (e.g., *T. tahoei* and *T. regalis*).

The **Erectirostra Group** (Figure 11) comprises three eastern species: *T. erectirostra* Fisher & Dowling, sp. n.; *T. karambita* Fisher & Dowling, sp. n.; and *T. robisoni* Fisher & Dowling, sp. n. These closely related species are readily identifiable with the following combination of characters: thick subcapitular rostra (when viewed ventrally) that is strongly upturned and dentate and Cxgl-4 nearly halfway down gnathosomal bay. No other *Torrenticola* in North America have similar subcapitular rostra and members of the Erectirostra Group can be readily sorted under low magnification. In terms of body shape and coloration, they superficially resemble Neoanomala Group, to which they are closely related.

The **Neoanomala Group** (Figure 11) comprises two eastern species: *T. interiorensis* Fisher & Dowling, sp. n. and *T. neoanomala* Habeeb, 1957. These closely related species are readily identifiable with the following combination of characters: dorsal coloration often purplish, separated into anterior and posterior portions; hind coxal apodemes distinct; and other characters relatively unmodified. Members of the Neoanomala Group are readily differentiated from the superficially similar Rusetria Group by having distinct hind coxal apodemes, whereas all members of the Rusetria Group have indistinct hind coxal apodemes. Another species—*T. bondi* Fisher & Dowling, sp. n.—resembles members of this group, but is not closely related. *T. bondi* have a shorter medial suture (10–15 µm in female *T. bondi*, 22–40 µm in female Neoanomala Group; 55–70 µm in male *T. bondi*, 75–110 µm in male Neoanomala Group). Also, *T. bondi* is currently known only from Haywood County (North Carolina), which implies that this species is either rare, or has a restricted distribution.

Miniforma Complex (Figure 7–9, 12–13): Molecular analyses recovered eight western species in this complex. Additionally, fresh material for molecular analysis was not available for five other species (*T. occidentalis* (Marshall, 1933); *T. miniforma* Habeeb, 1974; *T. oliveri* Fisher & Dowling, sp. n.; *T. leviathan* Fisher & Dowling, sp. n.; and *T. pinocchio* Fisher & Dowling, sp. n.) that are suspected to be within this complex based upon morphology. Another species, *T. oregonensis* Fisher & Dowling,

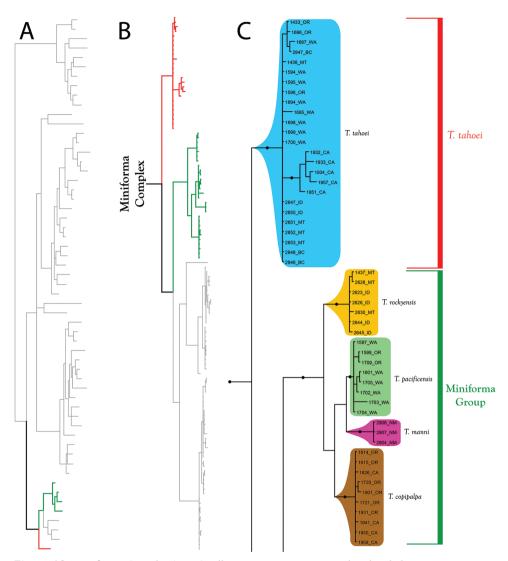

Figure 12. Miniforma Complex (part I). All species are western. Note that the phylogenetic structure in the Miniforma Group corresponds to biographic regions (Rockies, Pacific Ranges, southwest). **A** Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Miniforma Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Miniforma Complex (in part) from B **C** Detail of Miniforma Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

sp. n., superficially resembles members of this complex, but is divergent enough that we avoid placing this species pending molecular support. Therefore, in total, we propose 13 species in this complex.

These species are organized into two monophyletic species groups: Ellipsoidalis Group and Miniforma Group. The two members of this complex that are not placed

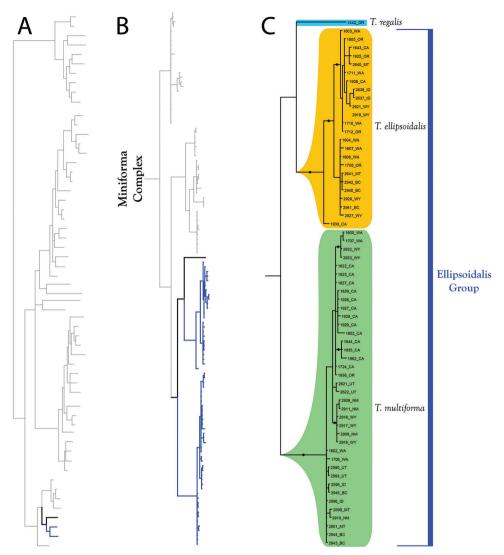

Figure 13. Miniforma Complex (part II). All species are western. One species (*T. regalis*) does not fit within a species group. Note that *T. ellipsoidalis* and *T. multiforma* are widespread in the west (C). A Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Miniforma Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Miniforma Complex (in part) from B **C** Detail of Miniforma Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

within a species group include *T. tahoei* (Marshall, 1943), which is among the most recognizable species of the genus, and *T. regalis* Fisher & Dowling, sp. n., which can only be confidently identified by keying slide-mounted specimens. *Torrenticola tahoei* is consistently recovered as sister to the rest of the species in this complex and *T. regalis* is consistently recovered sister to Ellipsoidalis Group.

The **Miniforma Group** (Figure 12) comprises seven western species: *T. manni* Fisher & Dowling, sp. n.; *T. oliveri* Fisher & Dowling, sp. n.; *T. pinocchio* Fisher & Dowling, sp. n.; *T. miniforma* Habeeb, 1974; *T. pacificensis* Fisher & Dowling, sp. n.; *T. rockyensis* Fisher & Dowling, sp. n.; and *T. copipalpa* Fisher & Dowling, sp. n. Members of this group are often readily identified by their smaller body size than other *Torrenticola* within their range except for Wester 2-Plates (*T. mulleni* Fisher & Dowling, sp. n.; and *T. welbourni* Fisher & Dowling, sp. n.; *T. walteri* Fisher & Dowling, sp. n.; and *T. welbourni* Fisher & Dowling, sp. n.). Members of the Miniforma Group are easily distinguished from Western 2-Plates, which have dorso-lateral platelets fused to the dorsal plate. The Miniforma Group can be further differentiated from all other *Torrenticola* by their distinctive pedipalp genual extensions. Females of this group have a relatively large genital field, which we suspect coincides with loss of larval parasitism.

The **Ellipsoidalis Group** (Figure 13) comprises four western species: *T. occidentalis* (Marshall, 1933); *T. ellipsoidalis* (Marshall, 1943); *T. leviathan* Fisher & Dowling, sp. n.; and *T. multiforma* Habeeb, 1974. Members of this group are readily identified from co-occurring *Torrenticola* via their larger body size than other species in a given sample. *Torrenticola occidentalis* may fit within this species group based upon overall similarity and by having a short, conical rostrum, but we were not able to obtain fresh material to confirm this hypothesis.

Rusetria Complex (Figure 7–9, 14–16): Molecular analyses recovered 17 species in this complex. Additionally, fresh material for molecular analysis was not available for nine other species that are included here based upon morphology: *T. rufoalba* Habeeb, 1955; *T. kittatinniana* Habeeb, 1955; *T. indistincta* (Marshall, 1929); *T. whitneyae* Fisher & Dowling, sp. n.; *T. microbiscutella* Fisher & Dowling, sp. n.; *T. feminellai* Fisher & Dowling, sp. n.; *T. priapus* Fisher & Dowling, sp. n.; *T. folkertsae* Fisher & Dowling, sp. n.; and *T. pulchra* Fisher & Dowling, sp. n. In total, there are 26 species in this complex.

Unlike other species complexes, the Rusetria Complex corresponds to a previously recognized subgenus—"*Rusetria*"—that occurs worldwide and is identified by the fusion of the lateral platelets. Goldschmidt (2007) called species with fused lateral platelets "*Rusetria*-like species" and we continue that terminology here. However, our analyses indicate that a reversal to free lateral platelets occurred twice: once in a clade sister to the Eastern 2-Plates and once within the Eastern 2-Plates (*T. glomerabilis*). Members of the Rusetria Complex can also be differentiated from superficially similar species by having indistinct hind coxae (distinct in most similar species, such as the Neoanomala and Raptor Groups). Only a few other species have indistinct hind coxal margins (*T. dolichodactyla*, *T. skvarlai*, and occasionally *T. flangipalpa*) or partial hind coxal margins (*T. regalis*, *T. sharkeyi*, and membes of the Nigroalba and Rala Groups,). This character is particularly useful when differentiating Eastern 4-Plates from similar species.

Two interesting evolutionary stories are suggested by the combined molecular analysis. The first involves the fusion of the lateral platelets, which seems to have a complex evolutionary history. For example, if this character is synapomorphic for the Rusetria Complex, then there have been multiple reversals. Furthermore, the position of the Partial 2-Plates suggests that the partial fusion of their lateral platelets represents

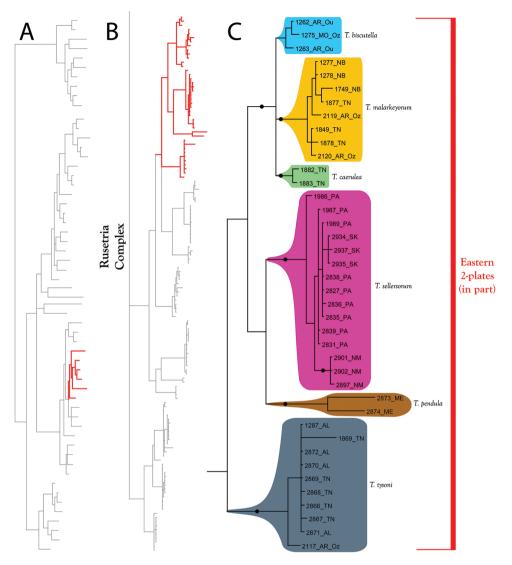

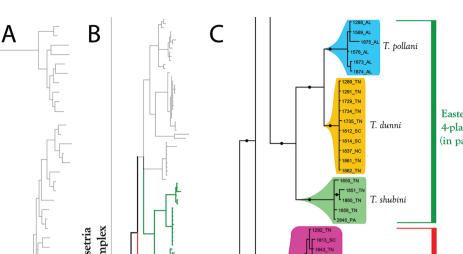

Figure 14. Rusetria Complex (part I). All species are eastern, but note the distribution of *T. sellersorum* extends into New Mexico and Saskatchewan. **A** Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Rusetria Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Rusetria Complex (in part) from B **C** Detail of Rusetria Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

a transitional step to complete fusion. But this story is even more complicated by *T. glomerabilis*, which has regained free lateral platelets separately from the rest of the Eastern 4-Plates. Ultimately, understanding the evolution of lateral platelet fusion, even within the eastern U.S., will depend on a much greater sampling of this world-

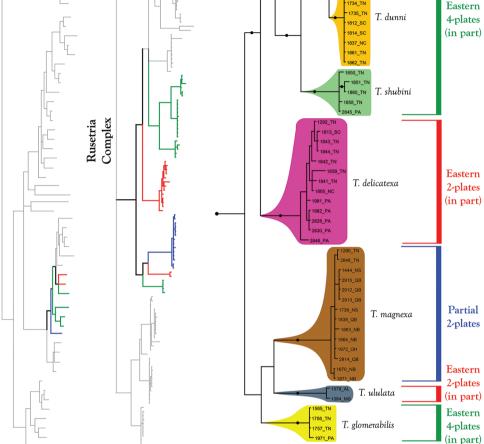

Figure 15. Rusetria Complex (part II). All species are eastern. Relationships among species groups remain unresolved, except for three species (T. dunni; T. pollani; and T. shubini), which form a well-supported clade in all analyses. A Species guide (overview of 28S+COI analysis from Figure 7–8) B Overview of Rusetria Complex from Figure 9 (COI-only analysis from Figure 9) C Detail of Rusetria Complex (in part) from B C Detail of Rusetria Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

wide species complex. Second, significant sexual size dimorphism (i.e., males 20-30% smaller than females), which is found in most members of this complex worldwide, likely arose once within the complex basally, but was subsequently and independently lost (i.e., males 5–15% smaller than females) three times: twice within the Eastern 4-Plates (once with the sister species *T. dunni* Fisher & Dowling, sp. n. and *T. pollani* Fisher & Dowling, sp. n., and once with *T. glomerabilis* Fisher & Dowling, sp. n.) and once with *T. ululata* Fisher & Dowling, sp. n.

The 23 species of the Rusetria Complex are organized into four species groups: Eastern 4-Plates, Eastern 2-Plates, Partial 2-Plates, and Western 2-Plates.

The Eastern 2-Plate Group (Figure 14-15) comprises 12 eastern species: T. biscutella Fisher & Dowling, sp. n.; T. whitneyae Fisher & Dowling, sp. n.; T. microbiscutella Fisher & Dowling, sp. n.; T. feminellai Fisher & Dowling, sp. n.; T. caerulea Fisher & Dowling, sp. n.; T. delicatexa Habeeb, 1955; T. indistincta (Marshall, 1929); T. malarkeyorum Fisher & Dowling, sp. n.; T. pendula Fisher & Dowling, sp. n.; T. sellersorum Fisher & Dowling, sp. n.; T. tysoni Fisher & Dowling, sp. n.; and T. ululata Fisher & Dowling, sp. n. This group is not monophyletic because of the exclusion of T. glomerabilis Fisher & Dowling, sp. n., which is considered an Eastern 4-Plate based on morphology. Members of this group are readily identifiable by having dorso-lateral platelets fused with the dorsal plate, thus giving the appearance of having only two plates, the anterio-medial platelets. Most members of this group are colorful (except for T. indistincta, which resembles Western 2-Plates) and nearly all have similar dorsal patterns that are separated into anterior and posterior portions, which are occasionally connected medially (except T. ululata, Figures 262-263). Members of the Eastern 2-Plate group are similar to the western counterpart (below) in having fused lateral platelets. However, the majority of eastern species are distinctly more colorful than most western species, which are either colorless or only faintly colored, and the groups exhibit non-overlapping ranges.

The Western 2-Plate Group (Figure 16) comprises four western species: *T. mulleni* Fisher & Dowling, sp. n.; *T. nortoni* Fisher & Dowling, sp. n.; *T. walteri* Fisher & Dowling, sp. n.; and *T. welbourni* Fisher & Dowling, sp. n. Members of this group are readily identifiable by having dorso-lateral platelets fused with the dorsal plate, thus giving the appearance of having only two plates. Although resembling Eastern 2-Plates, ranges are non-overlapping and western species are immediately identifiable by being colorless or nearly so, whereas most eastern species (except *T. indistincta*) are colorful. Besides range information, *Torrenticola indistincta* can be differentiated from Western 2-Plates by having coxal apodemes I-II not meeting posteriorly (meeting in western-two plates, usually with an accompanying medial suture).

The **Partial 2-Plate Group** (Figure 15) comprises four eastern species: *T. priapus* Fisher & Dowling, sp. n.; *T. folkertsae* Fisher & Dowling, sp. n.; *T. pulchra* Fisher & Dowling, sp. n.; and *T. magnexa* Habeeb, 1955. These species are readily distinguished from all other *Torrenticola* by having dorso-lateral platelets only partially fused to the dorsal plate. In practice, when sorting under low magnification (i.e., stereoscope), this group appears to be Eastern 2-Plates, but closer inspection will show that the lateral platelet borders are distinct, even under low magnification. This group will likely not be confused with members of the Rusetria 4-Plates (below), as the latter do not appear to have lateral plate fusion, even under low magnification.

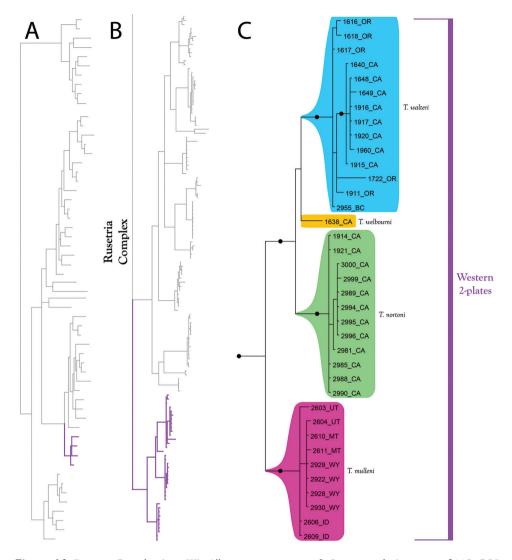

Figure 16. Rusetria Complex (part III). All species are western. A Species guide (overview of 28S+COI analysis from Figure 7–8) B Overview of Rusetria Complex from Figure 9 (COI-only analysis from Figure 9)
C Detail of Rusetria Complex (in part) from B. D Detail of Rusetria Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

The Eastern 4-Plate Group (Figure 15) comprises six eastern species: *T. dunni* Fisher & Dowling, sp. n.; *T. glomerabilis* Fisher & Dowling, sp. n.; *T. kittatinniana* Habeeb,1955; *T. pollani* Fisher & Dowling, sp. n.; *T. rufoalba* Habeeb, 1955; and *T. shubini* Fisher & Dowling, sp. n. This group is not monophyletic because *T. glomerabilis* is more closely related to Eastern 2-Plates. Members of this group can be readily differentiated from all other species of the Rusetria Complex by having anterio-lateral platelets completely free from the dorsal plate, hence "4-Plates". All members of this group are colorful and have similar dorsal patterns that are separated into anterior and posterior portions and occasionally connected medially. Members of this group resemble the Neoanomala Group in overall appearance and coloration; however, they can be readily differentiated by having indistinct hind coxal margins (distinct in Neo-anomala Group). Members of this group also resemble *T. skvarlai* in terms of overall appearance and coloration, and in having indistinct hind coxal margins; however, they can be readily differentiated by having conical, tuberculate pedipalp femoral extensions (broadly tuberculate in *T. skvarlai*).

Tricolor Complex (Figure 7–9, 17–18): Molecular analyses recovered 10 species in this complex. Fresh material for molecular analysis was not available for four other species (*T. bittikoferae* Crowell, 1960; *T. cardia* Fisher & Dowling, sp. n.; *T. kringi* Fisher & Dowling, sp. n.; and *T. mohawk* Fisher & Dowling, sp. n.) that are grouped within this complex based upon morphology. In total, there are 14 species within the Tricolor Complex.

This complex is divided into eastern and western lineages. The eastern lineage contains species that are among the most distinctive of all *Torrenticola* (e.g., *T. trimaculata* Fisher, 2015; *T. dimorpha* Fisher & Dowling, sp. n.; and *T. projector* Habeeb, 1961). This complex contains one species group, the Tricolor Group, which is paraphyletic with respect to *T. projector*. This species has an elongate morphology that is unique among species of the Tricolor Complex.

The Tricolor Group (Figure 17-18) comprises 13 species: T. bittikoferae Crowell, 1960; T. cardia Fisher & Dowling, sp. n.; T. kringi Fisher & Dowling, sp. n.; T. dimorpha Fisher & Dowling, sp. n.; T. mohawk Fisher & Dowling, sp. n.; T. hoosieri Fisher & Dowling, sp. n.; T. larvata Cherri, Fisher, & Dowling, 2016; T. olliei Fisher & Dowling, sp. n.; T. pearsoni Fisher & Dowling, sp. n.; T. projector Habeeb, 1961; T. sierrensis (Marshall, 1943); T. tricolor Habeeb, 1957; T. trimaculata Fisher, 2015; and T. unimaculata Fisher & Dowling, sp. n. Most species are distributed in eastern North America, except for T. sierrensis and T. olliei, which are western. The most distinguishing characteristic of this group is a short, conical rostrum, which is noticeably downturned in males. The only exception is *T. kringi*, which has a conical rostrum that is longer than other members of the group. Five members of the Tricolor Group form a monophyletic subgroup and can be readily recognized by having dorsal coloration composed of one or more spots (T. kringi, T. mohawk, T. tricolor, T. trimaculata, T. unimaculata). The Tricolor Group also contains a morphologically enigmatic species that has strong sexual dimorphism: T. dimorpha. Finally, T. bittikoferae likely fits within this complex, but fresh material was not available to test this hypothesis.

Biogeography

Of the 90 species discussed herein, 57 are primarily eastern (east of the 100th Meridian) and 33 are western (west of the 100th Meridian). Only a few species are distributed on

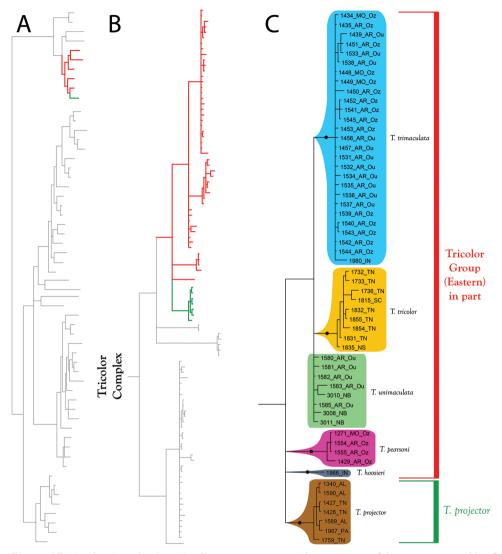

Figure 17. Tricolor Complex (part I). All species are eastern. These are some of the most recognizable of all *Torrenticola*, namely the elongate *T. projector* and a clade of species with diagnostic color patterns (*T. tri-maculata*, *T. unimaculata*, and *T. tricolor*). Note that three species (*T. pearsoni*, *T. hoosieri*, and *T. projector*) are repeated in Figure 18. **A** Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Tricolor Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Tricolor Complex (in part) from B **C** Detail of Tricolor Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

either side of this barrier: *T. irapalpa* is widespread in the east and has populations in Saskatchewan; *T. rala* is widespread from Costa Rica to Arizona and is also found in southcentral Texas; and *T. sellersorum* has a widespread, but sporadic, distribution spanning

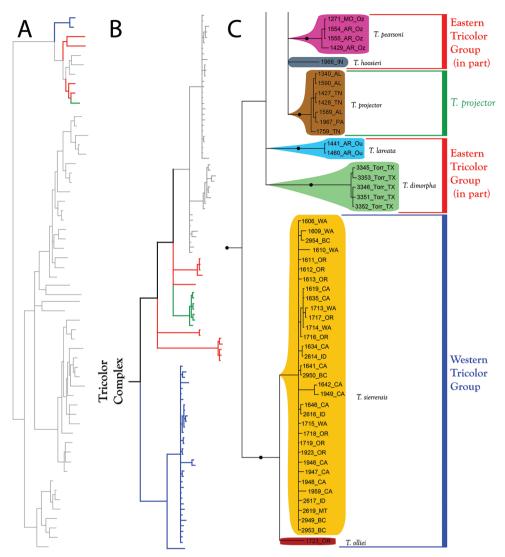

Figure 18. Tricolor Complex (part II). Most species of the Tricolor Complex are eastern, but one lineage is western: *T. sierrensis*, widespread; and *T. olliei*, north Pacific coast. The most apomorphic *Torrrenticola* (*T. dimorpha*) is recovered here in all analyses. Note that three species (*T. pearsoni*, *T. hoosieri*, and *T. projector*) are repeated in Figure 17. **A** Species guide (overview of 28S+COI analysis from Figure 7–8) **B** Overview of Tricolor Complex from Figure 9 (COI-only analysis from Figure 9) **C** Detail of Tricolor Complex (in part) from B **C** Detail of Tricolor Complex (in part) from Figure 9. Colored lineages in A and B correspond to Group names and brackets in C. Dots denote posterior probably of greater than 95%. Taxa are displayed by DNA number and state (U.S.) or territory (Canada) abbreviation.

Arizona to Manitoba and Ohio to Pennsylvania. Aside from these few species, the Great Plains acts as a biogeographic barrier for most species and *Torrenticola* are not common within this region.

Much of the discrepancy between the eastern and western diversity is due to increased diversity in the Appalachians, particularly due to increased speciation within the Raptor and Rusetria Complexes, which have 17 (14 endemic) and 15 (12 endemic) species found in the Appalachians, respectively. The Southern Appalachian region is particularly diverse, with 14 endemics (T. arktonyx, T. bondi, T. karambita, T. longitibia, T. danielleae, T. daemon, T. dentirostra, T. racupalpa, T. dunni, T. glomerabilis, T. whitneyae, T. microbiscutella, T. feminellai, and T. pollani). The Northern Appalachian region contains six species known only from that area (T. elusiva, T. kittatinniana, T. folkertsae, T. pendula, T. rufoalba, and T. mohawk); however, two of these are known only from their type localities in northern New Jersey (T. kittatinniana and T. ru*foalba*). Eight species are restricted to the Appalachians, but range throughout both northern and southern regions (T. erectirostra, T. gorti, T. reduncarostra, T. skvarlai, T. delicatexa, T. shubini, T. cardia, T. projector). Three species appear to be widespread in the northeast (i.e., extending into the Great Lakes region in Ottawa), but also extend southward throughout the Appalachians (T. nigroalba, T. raptor, and T. tricolor). The remaining eastern diversity includes seven widespread species (T. malarkeyorum, T. trimaculata, T. irapalpa, T. neoanomala, T. magnexa, T. priapus, and T. sellersorum); seven species endemic to the Interior Highlands (T. biscutella, T. interiorensis, T. robisoni, T. solisorta, T. larvata, T. pearsoni, and T. unimaculata); six species from the nonmountainous southeast (T. caerulea, T. elongata, T. flangipalpa, T. gnoma, T. tysoni, and T. ululata); four species known only from the Midwest (T. bittikoferae, T. indistincta, T. hoosieri, and T. pulchra); one species from Florida (T. ivyae); and one species from eastern Texas (T. kringi).

Our results point to two eastern regions that have high diversity and an increased proportion of endemic species: the southern Appalachians (including southern Pennsylvania) and the Interior Highlands (Ozarks and Ouachitas of Missouri, Arkansas, and Oklahoma). Of the 31 species known from the southern Appalachians, 14 are endemic. Of the 13 species known form the Interior Highlands, seven are endemic. Each of these regions is well-known for its diversity and endemism of aquatic taxa, due to a complex biogeographic history where they have acted as refugia (Robison & Allen 1995; Radwell et al. 2011; Skvarla et al. 2015).

By contrast, western *Torrenticola* are less diverse, with 32 species known from the region. Four species are widespread (*T. ellipsoidalis, T. multiforma, T. sierrensis*, and *T. tahoei*), although only one of these, *T. multiforma*, is also found in the southwest. Two species are found throughout much of California (*T. nortoni* and *T. ventura*) with only *T. ventura* extending northward into southwestern Oregon. One species is known from south-central Texas (*T. dimorpha*). The remaining western diversity is distributed into patterns that roughly correspond to three major ecoregions: Rocky Mountains, Pacific Ranges, and the arid southwest. The Rockies contain three endemics (*T. occidentalis, T. rockyensis*, and *T. mulleni*). The Pacific Ranges of British Columbia, Washington, Oregon, and northern California contain nine endemics (*T. miniforma, T. oregonensis, T. oliveri, T. leviathan, T. pinocchio, T. pacificensis, T. regalis, T. welbourni*, and *T. olliei*),

and two species that also range into the Sierra Nevada (*T. copipalpa* and *T. walteri*), although the latter (*T. walteri*) is also known from one locality in the Rockies of southern British Columbia. The arid southwest (southern California, Arizona, and New Mexico) contains eleven species restricted to that region in the US (*T. boettgeri*, *T. kees-davidsi*, *T. kurtvietsi*, *T. lamellipalpis*, *T. dolichodactyla*, *T. anoplopalpa*, *T. raptoroides*, *T. sharkeyi*, *T. wiedenmanni*, and *T. rala*), although five of these extend southward into Mexico and Central America (*T. boettgeri*, *T. keesdavidsi*, *T. kurtvietsi*, *T. lamellipalpis*, and *T. rala*) and one is also found in southern Texas (*T. rala*).

Our results suggest the diversity of *Torrenticola* in eastern North America can be explained by as few as three dispersal events, followed by subsequent radiations (Figure 8). Western diversity is more complex and was likely influenced from southern species extending northward and also by northern species that crossed Beringia and extended southward. However, even these results are speculative, pending worldwide sampling.

The distributions described above show the variable dispersal capabilities of different species within the genus. For instance, some species are wide-ranging, with distributions that span multiple topographic barriers (e.g., *T. irapalpa, T. multiforma*, and *T. ellipsoidalis*), whereas other groups are endemic to specific geographic areas and so are not able to cross such barriers (e.g., *T. pacificensis, T. rockyensis, T. arktonyx*, and *T. solisorta*). To explain this variation, adequate knowledge of the dispersal capabilities of both the adult and larval stages is required.

It seems well-understood that water mite larvae utilize the dispersal capabilities of their winged insect hosts. Indeed, it is normally inferred that dispersal is the primary function of the parasitic larvae, as is exemplified by the following passage from Proctor et al. (2015, pg. 639):

"The dominant strategic role of the larval instar in the life history of most Hydryphantoidea, Lebertioidea, Hygrobatoidea, and Arrenuroidea appears to be dispersal rather than growth. Species that have the parasitic larval stage suppressed illustrate that development of large eggs can obviate the need for larval feeding. However, the relative rarity of this phenomenon attests to the crucial role of larval dispersal in more derived water mite species."

Consistent with this view, many lentic water mites utilize far-flying hosts such as dragonflies (e.g., *Arrenurus*), various true bugs (e.g., *Hydrachna*), and beetles (e.g., *Eylais*) (Proctor et al. 2015). However, if *Torrenticola* were utilizing such hosts, we would expect fewer instances of endemism, as well as more dispersal events across the east-west divide. Instead, all eastern *Torrenticola* diversity could be explained by as little as three dispersal events. We speculate that this pattern can be explained by *Torrenticola* larval ecology. *Torrenticola*, like most lotic water mites, parasitize nematocerous flies, especially Chironomidae. *Torrenticola* are reported from the thoraces (rarely abdomen) of three chironomid subfamilies and ten genera: Tanypodinae (1 genus), Orthocladiinae (6 genera), and Chironominae (3 genera) (Smith & Oliver 1976, 1986). In the proper habitat (clean fast-flowing streams and riffles), *Torren*- *ticola* adults are typically far more abundant than other water mites and larvae are easily identified by possessing fused coxal plates (unlike all other Lebertioidea [Smith 1982]), which should increase both the likelihood of larvae being sampled on a host and being identified by researchers. However, larval *Torrenticola* are rarely reported. Unfortunately, *Torrenticola* larvae are not currently correlated with adults, so there is no way to link species to hosts and we can only conclude that at least some unidentified species parasitize chironomids.

This lack of knowledge has important ramifications because chironomids appear to have different inter- and intra-species natal fidelity. Although only a few studies have addressed adult chironomid dispersal (e.g., Delettre and Morvan 2000, Krosch et al. 2011), they suggest that the propensity for adult chironomids to disperse decreases when the natal stream is bordered by dense vegetation, which appears to confine them to the stream from which they emerged. This trend is not restricted to chironomids as other aquatic insects that inhabit flowing water are also unable to disperse through dense riparian vegetation (Titmus 1980, Jackson and Resh 1989, Peterson et al. 1999, Delettre and Morvan 2000). Conversely, in areas with low vegetation, chironomids have been shown to disperse further (Delettre and Morvan 2000), and under such conditions can even cross into nearby catchments (Krosch et al. 2011).

We speculate that broadly distributed water mite species (e.g., T. ellipsoidalis, T. multiforma, T. sierrensis, T. tahoei, T. malarkeyorum, T. trimaculata, T. irapalpa, T. neoanomala, T. magnexa, T. priapus, and T. sellersorum) disperse primarily during the larval stage by utilizing chironomids with low natal fidelity, whereas species that are confined to a smaller geographic region (e.g., T. solisorta, T. larvata, T. pacificensis, T. rockyensis, T. arktonyx) either utilize chironomids that have high natal fidelity, or they have lost parasitism altogether. As discussed previously, loss of parasitism is especially likely with members of the Miniforma Group, which in addition to high endemism, also possess characters that have been proposed for species that have lost parasitism, such as smaller body size and a larger female genital opening (Smith 1998). In either case (host natal fidelity or loss of parasitism), the result is that species confined to a smaller geographic region may be more dependent on the adult stage for dispersal. A sound understanding of Torrenticola larval ecology, including host associations, is critical to understanding the biology of the genus. Unfortunately, this area of inquiry is inhibited by our limited understanding, not only of water mites, but also chironomids, which are also understudied in North America, leaving most aspects of the biology of nearly all species involved a mystery.

To fully understand the evolution of *Torrenticola* within North America, analyses are needed that include worldwide taxon sampling and robust analyses of multiple genes, as well as a comprehensive understanding of larval ecology. To this end, we recommend the following areas of study for future investigation in North America: 1) surveys that correlate larval and adult chironomids; 2) dispersal studies on lotic chironomids; 3) surveys that correlate larval and adult water mites; and 4) surveys that investigate host specificity (i.e., identify both water mite larvae on hosts as well as the species of the hosts).

Taxonomy

Descriptions

Torrenticola anoplopalpa Fisher & Dowling, sp. n. http://zoobank.org/F4A21077-83A3-4FD9-A0B6-F95AF29F730E

Material examined. HOLOTYPE (♂): USA, New Mexico, Catron County, Glenwood; Whitewater Picnic Area, 8 km east of Rt. 180, (33°22'22"N, 108°50'50"W), 12 July 1987, by IM Smith, IMS870084.

PARATYPES (0 ♀; 0 ♂):

Type deposition. Holotype (\mathcal{O}) deposited in the CNC.

Diagnosis. Torrenticola anoplopalpa are similar to other members of the Rala Group (*T. boettgeri*, *T. dolichodactyla*, *T. kurtvietsi*, *T. keesdavidsi*, *T. lamellipalpis*, and *T. rala*) by being colorless, having incomplete hind coxal margins and being distributed in the southwest. Torrenticola anoplopalpa can be differentiated from all other Rala Group by having a more elongate subcapitulum (ventral length/width $\mathcal{J} = 4.16$ in *T. anoplopalpa*, 2.04–3.56 in others). Additionally, *T. anoplopalpa*, 0.98–1.86 in others), except *T. keesdavidsi* (1.84–1.96).

Description. FEMALE unknown.

MALE (Figure 20) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum — (640 long; 440 wide) ellipsoid and colorless. Anterio-medial platelets (152.5 long; 60 wide). Anterio-lateral platelets (205 long; 72.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 375). Dorsal plate proportions: dorsum length/width 1.45; dorsal width/distance between Dgl-4 1.17; anterio-medial platelet length/width 2.54; anterio-lateral platelet length/width 2.83; anterio-lateral/anterio-medial length 1.34.

Gnathosoma — **Subcapitulum** (322.5 long (ventral); 235 long (dorsal); 77.5 tall) elongate and colorless. Rostrum (110 long; 32.5 wide). Chelicerae (275 long) with curved fangs (40 long). Subcapitular proportions: ventral length/height 4.16; rostrum

Figure 19. Torrenticola anoplopalpa sp. n. distribution.

length/width 3.38. **Pedipalps** short and stocky (especially tibiae) without extensions on femora and genua. Palpomeres: trochanter (35 long); femur (77.5 long); genu (40 long); tibia (47.5 long; 17.5 wide); tarsus (12.5 long). Palpomere proportions: femur/ genu 1.94; tibia/femur 0.61; tibia length/width 2.71.

Venter — (775 long; 510 wide) colorless. Gnathosomal bay (127.5 long; 70 wide). Cxgl-4 subapical. **Medial suture** (70 long). **Genital plates** (160 long; 120 wide). Additional measurements: Cx-1 (310 long (total); 180 long (medial)); Cx-3 (330 wide); anterior venter (270 long). Ventral proportions: gnathosomal bay length/width 1.82; anterior venter/genital field length 1.69; anterior venter length/genital field width 2.25; anterior venter/medial suture 3.86.

IMMATURES unknown.

Etymology. Specific epithet (*anoplopalpa*) refers to the pedipalps, which lack tubercles on the femora and genua, an uncommon condition in *Torrenticola*, which usually have tuberculate ventral extensions (*anoplos*, G. unarmed; *palpus*, L. hand, feeler). **Distribution.** Southwest. New Mexico (probably also Arizona) (Figure 19).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola anoplopalpa* and so this species is not included in our phylogenetic analyses. However, we were able to examine material preserved in GAW for morphology. The overall appearance, incomplete hind coxal margins, lack of coloration, and distribution, are consistent with placing this species in the Rala Identification Group.

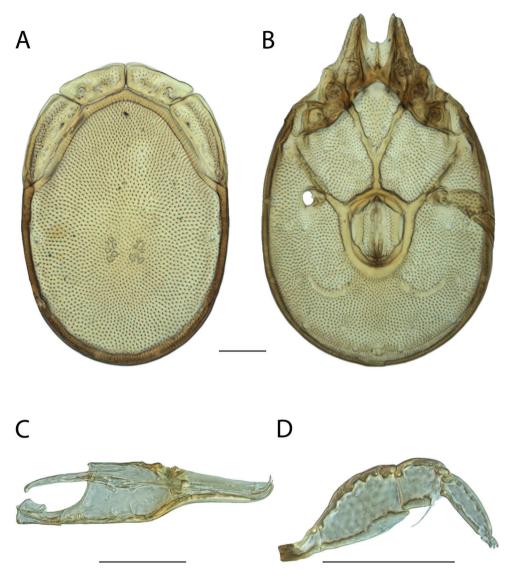

Figure 20. *Torrenticola anoplopalpa* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Torrenticola arktonyx Fisher & Dowling, sp. n. http://zoobank.org/4EC35C82-DF55-4F95-887C-534A4088A27C

Material examined. HOLOTYPE (\bigcirc): USA, North Carolina, Macon County, Rainbow Springs; beside Forest Route 67, 2.0 km south of road to Standing Indian Campground, (35°3'3"N, 83°31'31"W), 1 July 1990, by IM Smith, IMS900072

PARATYPES ($4 \bigcirc$; $5 \oslash$): **Georgia, USA**: $1 \bigcirc$ from White County, Helen; beside Road to Anna Ruby Falls just north of Unicoi State Park, ($34^{\circ}44'44''N$, $83^{\circ}43'43''W$), 24 September 1992, by IM Smith, IMS920051 • **North Carolina, USA**: $1 \bigcirc$ from Haywood County, Great Smokey Mountains National Park, Big Creek downstream of the bridge at picnic area, ($35^{\circ}45'45''N$, $83^{\circ}6'6''W$), 15 September 2009, by AJ Radwell, AJR090008A • $1 \bigcirc$ and $2 \oslash$ from Haywood County, Great Smoky Mountains National Park; Cataloochee; beside Mt. Sterling Rd. near bridge 1.7 km n. of road to Campground, ($35^{\circ}38'38''N$, $83^{\circ}4'4''W$), 6 September 2009, by IM Smith, IMS090099 • $2 \oslash$ from Macon County, Rainbow Springs; beside Forest Route 67, 2.0 km south of road to Standing Indian Campground, ($35^{\circ}3'3''N$, $83^{\circ}31'31''W$), 20 September 1991, by IM Smith, IMS910054 • $1 \oslash$ (ALLOTYPE) from Macon County, Rainbow Springs; beside Forest Route 67, 2.0 km south of road to Standing Indian Campground, ($35^{\circ}3'3''N$, $83^{\circ}31'31''W$), 1 July 1990, by IM Smith, IMS900072 • **Tennessee, USA**: $1 \bigcirc$ from Blount County, Middle Prong of the Little River at Tremont, ($35^{\circ}38'38''N$, $83^{\circ}41'41''W$), 16 September 2009, by AJ Radwell, AJR090009

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and some paratypes (2 \bigcirc ; 2 \circlearrowright) deposited in the CNC; other paratypes (2 \bigcirc ; 2 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola arktonyx are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (*T. dunni*, *T. glomerabilis*, *T. kittatinniana*, *T. pollani*, *T. rufoalba*, and *T. shubini*), Elongata Group (*T. elongata*, *T. gorti*, and *T. reduncarostra*), Neoanomala Group (*T. interiorensis* and *T. neoanomala*), and *T. erectirostra*, *T. robisoni*, *T. irapalpa*, *T. racupalpa*, *T. skvarlai*, and *T. bondi*. Torrenticola arktonyx can be differentiated from all other Torrenticola by having distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly.

Description. FEMALE (Figure 22) (n = 4) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (645–680 (670) long; 480–520 (510) wide) ovoid with purple coloration separated into anterior and posterior portions with faint orange medially, also with distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly. Anterio-medial platelets (137.5–145 (137.5) long; 65–70 (65) wide). Anterio-lateral platelets (200–207.5 (200) long; 80–90 (80) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 335–375 (375)). Dorsal plate proportions: dorsum length/width 1.29–1.34 (1.31); dorsal width/distance between Dgl-4 1.36–1.43 (1.36); anterio-medial platelet length/width 2.07–2.23 (2.12); anterio-lateral platelet length/width 2.31–2.56 (2.50); anterio-lateral/anterio-medial length 1.38–1.48 (1.45).

Gnathosoma — **Subcapitulum** (345–362.5 (355) long (ventral); 260–270 (265) long (dorsal); 117.5–120 (117.5) tall) with purple coloration. Rostrum (135–135 (135) long; 45–47.5 (45) wide). Chelicerae (335–350 (350) long) with curved fangs (45–55 (45) long). Subcapitular proportions: ventral length/height 2.88–3.09 (3.02); rostrum length/width 2.84–3.00 (3.00). **Pedipalps** with dentate, flanged ventral extensions on femora and genua. Palpomeres: trochanter (40–42.5 (41.25) long); femur (107.5–111.25 (111.25) long); genu (75–80 (77.5) long); tibia (92.5–95 (95) long;

Figure 21. Torrenticola arktonyx sp. n. distribution.

25–27.5 (25) wide); tarsus (25–25 (25) long). Palpomere proportions: femur/genu 1.38–1.44 (1.44); tibia/femur 0.85–0.86 (0.85); tibia length/width 3.36–3.80 (3.80).

Venter — (815–840 (815) long; 510–600 (600) wide) with purple coloration. Gnathosomal bay (137.5–155 (137.5) long; 82.5–92.5 (92.5) wide). Cxgl-4 subapical. **Medial suture** (50–60 (50) long). **Genital plates** (180–187.5 (180) long; 155–162.5 (155) wide). Additional measurements: Cx-1 (300–310 (300) long (total); 150–165 (165) long (medial)); Cx-3 (350–385 (385) wide); anterior venter (230–232.5 (230) long). Ventral proportions: gnathosomal bay length/width 1.49–1.82 (1.49); anterior venter/genital field length 1.24–1.28 (1.28); anterior venter length/genital field width 1.42–1.48 (1.48); anterior venter/medial suture 3.83–4.60 (4.60).

MALE (Figure 23) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (500–570 (570) long; 400–450 (450) wide) ovoid with purple coloration separated into anterior and posterior portions with faint orange medially, also with distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly. Anterio-medial platelets (110–125 (125) long; 55–62.5 (62.5) wide). Anterio-lateral platelets (155–180 (180) long; 65–75 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 305–345 (345)). Dorsal plate proportions: dorsum length/width 1.23–1.35 (1.27); dorsal width/distance between Dgl-4 1.30–1.35 (1.30); anterio-

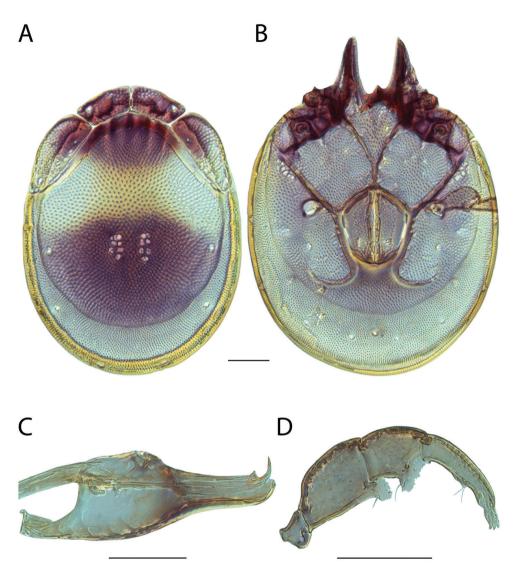

Figure 22. *Torrenticola arktonyx* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

medial platelet length/width 2.00–2.18 (2.00); anterio-lateral platelet length/width 2.21–2.69 (2.40); anterio-lateral/anterio-medial length 1.41–1.59 (1.44).

Gnathosoma — **Subcapitulum** (275–300 (300) long (ventral); 210–235 (235) long (dorsal); 92.5–102.5 (102.5) tall) with purple coloration. Rostrum (110–125 (125) long; 35–40 (40) wide). Chelicerae (270–305 (305) long) with curved fangs (40–45 (40) long). Subcapitular proportions: ventral length/height 2.75–3.08 (2.93); rostrum length/width 3.00–3.20 (3.13). **Pedipalps** with dentate, flanged ventral extensions on femora and genua. Palpomeres: trochanter (32.5–37.5 (35) long); femur

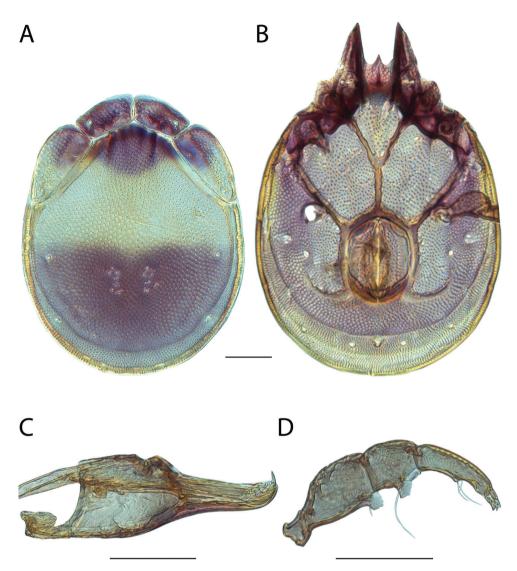

Figure 23. *Torrenticola arktonyx* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(85–97.5 (97.5) long); genu (60–68.75 (65) long); tibia (75–85 (85) long; 22.5–26.25 (25) wide); tarsus (21.25–25 (22.5) long). Palpomere proportions: femur/genu 1.42–1.50 (1.50); tibia/femur 0.81–0.91 (0.87); tibia length/width 3.10–3.40 (3.40).

Venter — (650–725 (725) long; 430–490 (490) wide) with purple coloration. Gnathosomal bay (125–135 (135) long; 65–72.5 (72.5) wide). Cxgl-4 subapical. **Medial suture** (75–90 (80) long). **Genital plates** (160–172.5 (172.5) long; 117.5–130 (130) wide). Additional measurements: Cx-1 (250–290 (290) long (total); 130–150 (145) long (medial)); Cx-3 (295–350 (350) wide); anterior venter (220–260 (260) long). Ventral proportions: gnathosomal bay length/width 1.85–2.08 (1.86); anterior venter/genital field length 1.38–1.55 (1.51); anterior venter length/genital field width 1.87–2.17 (2.00); anterior venter/medial suture 2.72–3.25 (3.25).

IMMATURES unknown.

Etymology. Specific epithet (*arktonyx*) refers to the distinctive longitudinal markings on the anterior dorsal plate, which resemble claw marks from a bear (*árktos*, G. bear; *ónyx*, G. claw).

Distribution. Southern Appalachians (Figure 21).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola arktonyx* and therefore this species is not included in our phylogenetic analyses. We were able to examine material preserved in GAW for morphology, but due its unique characteristics, we are unable to place this species into either a species complex or identification group. However, based upon coloration, distribution, and gnathosomal shape, we speculate that future analyses will place this species in the Raptor Complex.

Torrenticola biscutella Fisher & Dowling, sp. n. http://zoobank.org/F45BF84D-35BF-4498-A610-0EB69342AF30

Material examined. HOLOTYPE (\bigcirc): from USA, Arkansas, Montgomery County, South Fork Ouachita River, access off County Road 17 at Forest Road 903, 29 Jul 2011, by IM Smith, IMS110040, DNA 1263.

PARATYPES (4 \bigcirc ; 3 d): **Arkansas, USA**: 1 d (ALLOTYPE) from Montgomery County, Ouachita River (34°34'53.20"N, 93°53'0.16"W), 5 Oct 2007, by AJ Radwell, & HW Robison, AJR070300A • 2 d Montgomery County, Ouachita River (34°34'53.20"N, 93°53'0.16"W), 5 Oct 2007, by AJ Radwell, & HW Robison, AJR070300A • 3 \bigcirc from Montgomery County, South Fork Ouachita River, access off County Road 17 at Forest Road 903, 29 Jul 2011, by IM Smith, IMS110040 • Missouri, USA: 1 \bigcirc from Crawford County, Huzzah Creek, Red Bluff campground, off Road V east of Davisville, 23 Jul 2011, by IM Smith, IMS110029.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(2 \bigcirc; 1 \circlearrowright)$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola biscutella are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. caerulea, T. delicatexa, T. feminellai, T. indistincta, T. malarkeyorum, T. microbiscutella, T. pendula, T. sellersorum, T. tysoni, T. ululata, and T. whitneyae*) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except *T. indistincta* and *T. ululata*), and being distributed in the east. It is one of only four Eastern 2-Plates that have dark, bold, bluishpurple coloration (also *T. pendula, T. sellersorum*, and *T. tysoni*). Torrenticola biscutella can be differentiated from *T. caerulea, T. ululata, T. indistincta*, and *T. feminellai* by dorsal coloration and pattern. *T. biscutella* can be differentiated from *T. tysoni*). Female *T. biscutella* can be differentiated from female *T. malarkeyorum* by having a shorter subca-

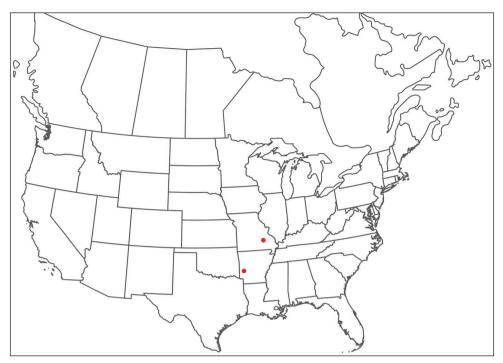

Figure 24. Torrenticola biscutella sp. n. distribution.

pitulum (ventral length = 290–315 in *T. biscutella*, 317.5–335 in *T. malarkeyorum*). Male T. biscutella can be differentiated from male T. malarkeyorum by having a slightly rounder dorsum (length/width 1.37-1.42 in T. biscutella, 1.42-1.56 in T. malarkeyorum). Additionally, although T. biscutella and T. malarkeyorum have the same dorsal coloration and pattern, often the coloration is bold in T. biscutella and faint in T. malarkeyorum. Female T. biscutella can be differentiated from female T. delicatexa by having a shorter genital field (152.5–167.5 in T. biscutella, 175–198 in T. delicatexa) and male T. biscutella can be differentiated from male *T. delicatexa* by having a slightly rounder dorsum (length/width = 1.37-1.42 in T. biscutella, 1.44-1.56 in T. delicatexa). Female T. biscutella can be differentiated from female T. sellersorum by anterior venter/genital field length (0.82-0.88 in T. biscutella, 0.69-0.77 in T. sellersorum). Male T. biscutella can be differentiated from male T. sellersorum by having slightly stockier anterio-lateral platelets (length/width = 2.58-2.74 in T. biscutella, 2.76-3.00 in T. sellersorum). T. biscutella can be differentiated from T. pendula by having a stockier gnathosomal bay (1.55-1.85 in T. biscutella, 2.42-2.9 in T. pendula); more elongate tibiae (3.11-3.45 in T. biscutella, 2.78-3.05 in T. biscutella); and by dorsal pattern. T. biscutella can be differentiated from T. microbiscutella by having a more ovoid dorsum (length/width = 1.33-1.42 in T. biscutella, 1.63-1.75 in *T. microbiscutella*) and by anterior venter/genital field width ($\mathcal{Q} = 0.84$ -0.91 in *T.* biscutella, 1.25–1.33 in *T. microbiscutella*; ♂ = 1.68–1.80 in *T. biscutella* and 1.95–2.29 in T. microbiscutella). T. biscutella can be differentiated from T. whitneyae by having more

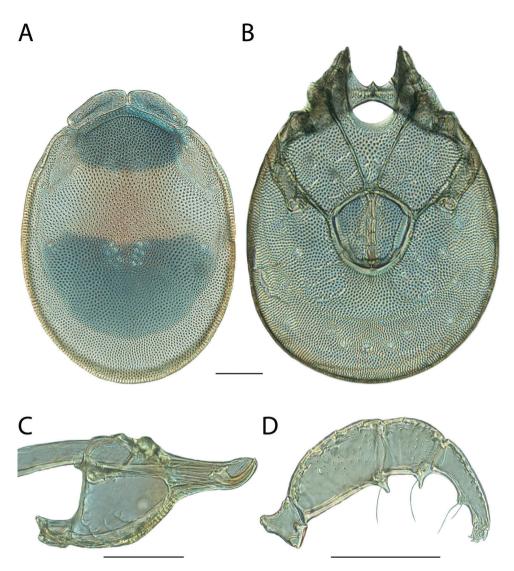

Figure 25. *Torrenticola biscutella* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

elongate pedipalpal tibiae (3.11–3.45 in *T. biscutella*, 2.42–2.95 in *T. whitneyae*) and by anterior venter/genital field length (Q = 0.82-0.88 in *T. biscutella*, 0.59–0.75 in *T. whitneyae*; arrow = 1.55-1.76 in *T. biscutella* and 1.37–1.43 in *T. whitneyae*).

Description. FEMALE (Figure 25) (n = 4) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (560–630 (560) long; 420–455 (420) wide) ovoid with bluish-purple coloration separated into anterior and posterior portions, and bold or faint orange medially. Anterio-medial platelets (122.5–135 (122.5) long; 40–45 (40) wide). Anterio-

lateral platelets (140–170 (140) long; 62.5–75 (62.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 300–330 (300)). Dorsal plate proportions: dorsum length/width 1.33–1.38 (1.33); dorsal width/distance between Dgl-4 1.38–1.40 (1.40); anterio-medial platelet length/width 3.00–3.31 (3.06); anterio-lateral platelet length/width 2.24–2.48 (2.24); anterio-lateral/anterio-medial length 1.14–1.28 (1.14).

Gnathosoma — **Subcapitulum** (290–315 (290) long (ventral); 207–240 (208) long (dorsal); 137.5–155 (137.5) tall) colorless. Rostrum (110–125 (110) long; 42.5–47.5 (42.5) wide). Chelicerae (286–335 (286) long) with curved fangs (55–70 (56) long). Subcapitular proportions: ventral length/height 2.02–2.11 (2.11); rostrum length/width 2.56–2.67 (2.59). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (43.75–50 (43.75) long); femur (107.5–122.5 (107.5) long); genu (65–72.5 (65) long); tibia (80–86.25 (80) long; 23.75–25 (23.75) wide); tarsus (20–20 (20) long). Palpomere proportions: femur/genu 1.59–1.74 (1.65); tibia/femur 0.69–0.74 (0.74); tibia length/width 3.35–3.45 (3.37).

Venter — (660–740 (660) long; 488–544 (489) wide) with faint bluish-purple coloration. Gnathosomal bay (151.25–172.5 (151.25) long; 97.5–100 (100) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (152.5–167.5 (152.5) long; 142.5–160 (142.5) wide). Additional measurements: Cx-1 (274–309 (275) long (total); 118–135 (121) long (medial)); Cx-3 (319–392 (319) wide); anterior venter (130–147.5 (130) long). Ventral proportions: gnathosomal bay length/width 1.55–1.73 (1.55); anterior venter/genital field length 0.82–0.88 (0.85); anterior venter length/ genital field width 0.84–0.91 (0.91).

MALE (Figure 26) (n = 3) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (430–445 (440) long; 310–315 (310) wide) ovoid with bluish-purple coloration separated into anterior and posterior portions, and bold or faint orange medially. Anterio-medial platelets (97.5–97.5 (97.5) long; 33.75–36.25 (35) wide). Anterio-lateral platelets (122.5–130 (130) long; 45–50 (47.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 230–242.5 (230)). Dorsal plate proportions: dorsum length/width 1.37–1.42 (1.42); dorsal width/distance between Dgl-4 1.30–1.35 (1.35); anterio-medial platelet length/width 2.69–2.89 (2.79); anterio-lateral platelet length/width 2.58–2.74 (2.74); anterio-lateral/anterio-medial length 1.26–1.33 (1.33).

Gnathosoma — **Subcapitulum** (230–235 (235) long (ventral); 175–177.5 (177) long (dorsal); 20–20 (20) tall) colorless. Rostrum (85–92.5 (92.5) long; 30–36.25 (36.25) wide). Chelicerae (225–241 (241) long) with curved fangs (45–50 (46) long). Subcapitular proportions: ventral length/height 2.29–2.47 (2.29); rostrum length/ width 2.55–2.83 (2.55). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (23.75–37.5 (37.5) long); femur (85–90 (90) long); genu (52.5–55 (55) long); tibia (68.75–72.5 (72.5) long; 21.25–22.5 (22.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.62–1.64 (1.64); tibia/femur 0.81–0.82 (0.81); tibia length/width 3.11–3.24 (3.22).

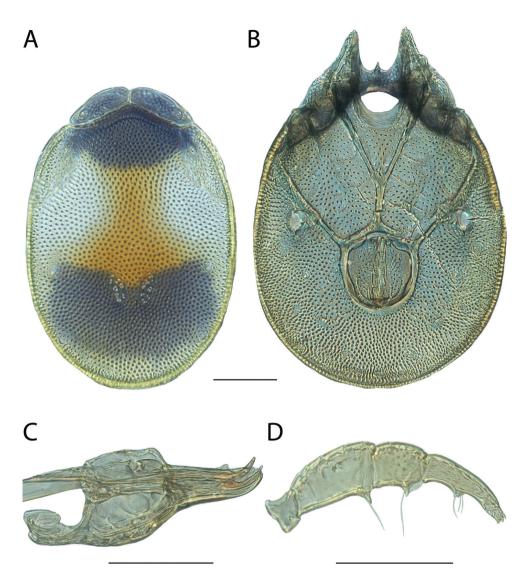

Figure 26. *Torrenticola biscutella* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Venter — (510–525 (525) long; 335–380 (336) wide) with faint bluish-purple coloration. Gnathosomal bay (115–122.5 (122.5) long; 65–67.5 (67.5) wide). Cxgl-4 subapical. **Medial suture** (60–65 (65) long). **Genital plates** (102.5–110 (102.5) long; 100–100 (100) wide). Additional measurements: Cx-1 (215–226 (226) long (total); 99–110 (100) long (medial)); Cx-3 (252–275 (252) wide); anterior venter (167.5–180 (180) long). Ventral proportions: gnathosomal bay length/width 1.70–1.85 (1.81); anterior venter/genital field length 1.55–1.76 (1.76); anterior venter length/genital field width 1.68–1.80 (1.80); anterior venter/medial suture 2.68–2.83 (2.77).

IMMATURES unknown.

Etymology. Specific epithet (*biscutella*) refers to the appearance of only two anterio-dorsal platelets due to the fusion of lateral platelets with the dorsal shield (*bi*-, L. two; *scutella*, L. little plate).

Distribution. Interior Highlands (both Ozarks and Ouachitas), likely endemic (Figure 24).

Remarks. Torrenticola biscutella groups with other members of the Rusetria Complex with high support and specimens of this species were less than 2% different in COI sequence from each other. In all analyses, *T. biscutella* groups with two other morphologically similar species: *T. malarkeyorum* and *T. caerulea*. These three species are 3–5% different from each other in COI sequence. The three of these species are morphologically similar to the more distantly-related *T. delicatexa*. Of these four species, the range of *T. biscutella* only overlaps with *T. malarkeyorum* in the Ozark Mountains and these species are easily differentiated by color. *T. biscutella* is the only one of these four species known from the Ouachita Mountains, and it is not known from east of the Mississippi River, where the other three species are distributed (only *T. malarkeyorum* is known from west of the Mississippi River).

Based upon overall similarity, dorso-lateral platelet fusion, and distribution, we were able to place this species within the Eastern 2-Plate Identification Group.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by morphological characters outlined in the diagnoses.

Torrenticola bittikoferae Crowell, 1960

T. bittikoferae: Crowell 1960: 36; 1961: 330 • Johnston 1965: 44 • Modlin and Gannon 1973: 219, 221 • Viets 1987: 756.

Material examined. PARATYPES (0 \bigcirc ; 2 \bigcirc): **Ohio, USA**: 2 \bigcirc from Ottawa County, Middle Bass Island, rubble beach, 29 June 1954, by R Crowell.

Type deposition. Holotype (\bigcirc) and some paratypes (unspecified number) deposited in the Chicago Natural History Museum (unexamined; types not located); other paratypes (2 \bigcirc) deposited in the OSUAC.

Diagnosis. Torrenticola bittikoferae are similar to other members of the Tricolor Group (*T. cardia*, *T. dimorpha*, *T. hoosieri*, *T. kringi*, *T. larvata*, *T. mohawk*, *T. olliei*, *T. pearsoni*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, and *T. unimaculata*) in having a short, conical rostrum. Torrenticola bittikoferae can be differentiated from most other Tricolor Complex (except *T. hoosieri*, *T. pearsoni*, and *T. dimorpha*) by being colorless, whereas most other members have bold patterning. *T. bittikoferae* can be differentiated from *T. hoosieri* by having ventral extensions on the pedipalp femora and genua (lacking in *T. hoosieri*) and having stockier pedipalp tibiae (length/width = 2.7–2.8 in *T. bittikoferae*, 3.6–4.4 in *T. hoosieri*). *T. bittikoferae* can be differentiated from *T. pearsoni* by having

Figure 27. Torrenticola bittikoferae distribution.

Dgl-4 further from the dorsal edge (dorsal width/distance between Dgl-4 = 1.6-1.7 in *T. bittikoferae*, 1.2-1.3 in *T. pearsoni*); stockier pedipalp tibiae (length/width = 2.7-2.8 in *T. bittikoferae*, 3.0-3.3 in *T. pearsoni*); and a more elongate rostrum (length/width = 1.8-1.9 in *T. bittikoferae*, 2.0-2.4 in *T. pearsoni*). *Torrenticola bittikoferae* can be differentiated from *T. dimorpha* by having an unmodified dorsal plate (*T. dimorpha* has a dorsal plate medial extension covering nearly half the length of the anterio-medial platelets) and by males having unmodified pedipalps (male *T. dimorpha* have large, highly modified pedipalps which are expanded vertically and laterally).

Re-description. MALE (Figure 28) (n = 2) with characters of the genus with following specifications.

Dorsum — (620–670 long; 500–530 wide) circular and colorless. Anterio-medial platelets (132.5–137.5 long; 70–70 wide). Anterio-lateral platelets (192.5–202.5 long; 90–92.5 wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 305–330). Dorsal plate proportions: dorsum length/width 1.24–1.26; dorsal width/distance between Dgl-4 1.61–1.64; anterio-medial platelet length/width 1.89–1.96; anterio-lateral platelet length/width 2.14–2.19; anterio-lateral/anterio-medial length 1.40–1.53.

Gnathosoma — Subcapitulum (265 long (ventral); 202.5 long (dorsal); 125 tall) colorless. Rostrum (95–100 long; 52.5–52.5 wide). Chelicerae (260 long) with curved fangs (50 long) short and conical. Subcapitular proportions: ventral length/height

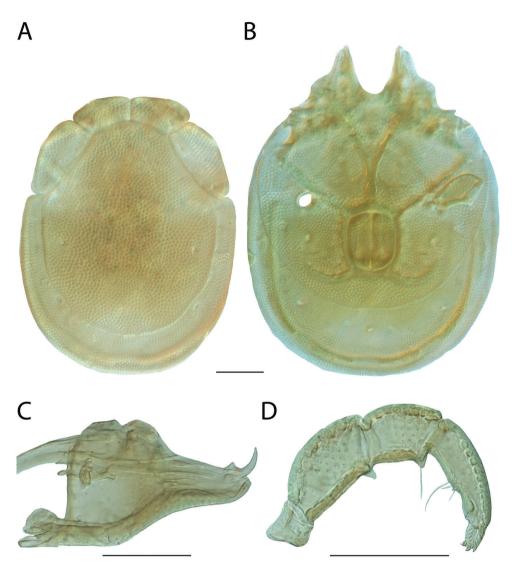

Figure 28. *Torrenticola bittikoferae* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

2.12; rostrum length/width 1.81–1.90. **Pedipalps** with tuberculate ventral extensions with dentate tip on femora and tuberculate ventral extensions on genua. Palpomeres: trochanter (42.5–42.5 long); femur (101.25–107.5 long); genu (72.5–75 long); tibia (87.5–90 long; 32.5–32.5 wide); tarsus (25–35 long). Palpomere proportions: femur/ genu 1.40–1.43; tibia/femur 0.81–0.89; tibia length/width 2.69–2.77.

Venter — (790–800 long; 610–680 wide) colorless. Gnathosomal bay (122.5–125 long; 87.5–100 wide). **Medial suture** (102.5–117.5 long). **Genital plates** (137.5–142.5 long; 115–115 wide). Additional measurements: Cx-1 (270–280 long (total);

152.5–152.5 long (medial)); Cx-3 (405–410 wide); anterior venter (270–287.5 long). Ventral proportions: gnathosomal bay length/width 1.23–1.43; anterior venter/genital field length 1.96–2.02; anterior venter length/genital field width 2.35–2.50; anterior venter/medial suture 102.5–117.5.

FEMALE type specimens unavailable for present study.

IMMATURES unknown.

Etymology. Robert Crowell (1960) named the specific epithet (*bittikoferae*) after Lelia Bittikofer, his high school biology teacher.

Distribution. Known only from type locality: Lake Erie, Ohio (Figure 27).

Remarks. Unfortunately, we were unable to acquire fresh specimens of *Torrenticola bittikoferae* and therefore this species was not included in our phylogenetic analyses. We were able to examine paratypes of two males, neither of which were dissected during slide preparation, making precise examination difficult. These specimens were remounted, but proper dissection risked fully damaging the specimen and was therefore avoided. The images in Figure 28A–B that appear to display a properly dissected specimen, were created by photographing each section (dorsum and venter) of the fully intact specimen and digitally editing the photographs so that the dorsum and venter could be easily compared with other species.

The overall appearance, short conical rostrum, and distribution of this species allows us to places it within the Tricolor Complex and Tricolor Identification Group.

Torrenticola boettgeri K.O. Viets, 1977

Torrenticola boettgeri K.O. Viets, 1977a: 89. *Torrenticola esbelta* Cramer, 1992: 22.

Material examined (1 \bigcirc ; 4 \circlearrowright). New Mexico, USA: 1 \bigcirc and 1 \circlearrowright from Catron County, Glenwood; Whitewater Picnic Area 8 km east of Rt. 180, (33°22'22"N, 108°50'50"W), 12 July 1987, by IM Smith, IMS870084 • 3 \circlearrowright from Catron County, beside Rt. 15, 65 km north of Rt. 180, Silver City, (33°12'12"N, 108°13'13"W), 10 July 1987, by IM Smith, IMS870081A

Type deposition. Holotype (\bigcirc), prep. no. 6381 SMF, Viets collection (not examined).

Diagnosis. Torrenticola boettgeri are similar to other members of the Rala Group (*T. anoplopalpa, T. dolichodactyla, T. keesdavidsi, T. kurtvietsi, T. lamellipalpis*, and *T. rala*) by being colorless, having incomplete hind coxal margins and being distributed in the southwest. *T. boettgeri* can be differentiated from all other Rala Group by having a more elongate dorsum (length/width Q = 1.74-1.82 in *T. boettgeri*, 1.21–1.60 in others) and a stockier subcapitulum (ventral length/width = 1.96 in *T. boettgeri*, 2.06–3.52 in others; $\mathcal{J} = 2.04-2.07$ in *T. boettgeri*, 2.14–4.16 in others).

Re-description. FEMALE (Figure 30) (n = 3: one specimen examined from New Mexico; measurements from two additional specimens are included based upon those listed in Goldschmidt (2007) for K.O. Viets's (1977a) specimen from Guatemala and

Figure 29. *Torrenticola boettgeri* distribution. Blue star represents type locality (Viets 1977a); blue diamond represents additional published record (Cramer 1992, as *T. esbelta* comb. n.); and red circles represent new records and material examined.

Cramer's (1992) specimen from Mexico) with characters of the genus with following specifications. Note: measurements below are from the above three combined sources; those in parentheses are from the Guatemalan holotype (Viets 1977a) as listed in Goldschmidt (2007).

Dorsum — (668–800 (675) long; 367–440 (440) wide) ovoid, elongate, and colorless. Anterio-medial platelets (103–135 (126) long; 38–52.5 wide). Anterio-lateral platelets (179–200 (199) long; 47–70 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 370). Dorsal plate proportions: dorsum length/width 1.53–1.82 (1.82); dorsal width/distance between

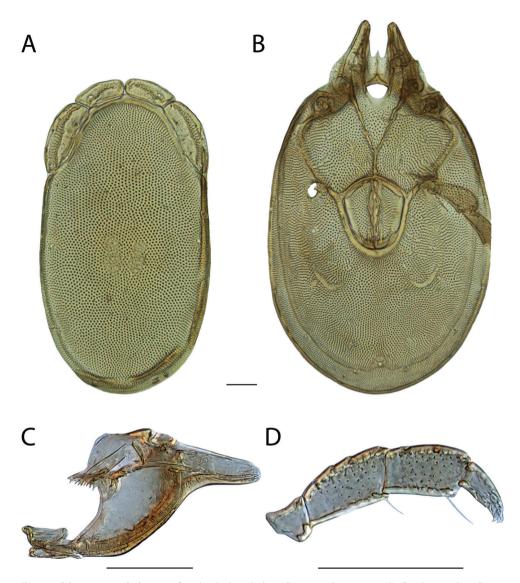

Figure 30. *Torrenticola boettgeri* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Dgl-4 1.19; anterio-medial platelet length/width 2.57–2.71; anterio-lateral platelet length/width 2.86–3.81; anterio-lateral/anterio-medial length 1.48–1.74 (1.58).

Gnathosoma — **Subcapitulum** (245–280 (245) long (ventral); 185 long (dorsal); 142.5 tall) colorless. Rostrum (70–87.5 (70) long; 40 wide). Chelicerae with curved fangs (65 long). Subcapitular proportions: ventral length/height 1.96; rostrum length/ width 2.19. **Pedipalps** short and stocky (especially tibiae) without extensions on femo-ra and genua. Palpomeres: trochanter (32.5 long); femur (76.25 long); genu (65 long);

tibia (32.5 long; 17.5 wide); tarsus (15 long). Palpomere proportions: femur/genu 1.17; tibia/femur 0.43; tibia length/width 1.86.

Venter — (668–955 (845) long; 452–570 (500) wide) colorless. Gnathosomal bay (164–200 (164) long; 45–50 (47) wide). Cxgl-4 apical. **Medial suture** (65–73 (73) long). **Genital plates** (170–188 (170) long; 148–160 (148) wide). Additional measurements: Cx-1 (340 long (total); 133–135 (133) long (medial)); Cx-3 (350 wide); anterior venter (212.5 long). Ventral proportions: gnathosomal bay length/width 3.49–4.44 (3.49); anterior venter/genital field length 1.15; anterior venter length/genital field width 1.33; anterior venter/medial suture 3.27.

MALE (Figure 31) (n = 4: new specimens from New Mexico)

Dorsum — (710–780 long; 400–430 wide) ovoid, elongate, and colorless. Anterio-medial platelets (122.5–140 long; 45–50 wide). Anterio-lateral platelets (175–192.5 long; 55–62.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 335–365). Dorsal plate proportions: dorsum length/width 1.74–1.81; dorsal width/distance between Dgl-4 1.16–1.19; anterio-medial platelet length/width 2.68–2.95; anterio-lateral platelet length/width 2.96–3.27 (3.08); anterio-lateral/anterio-medial length 1.25–1.47.

Gnathosoma — **Subcapitulum** (255–285 long (ventral); 165–187.5 long (dorsal); 125–137.5 tall) colorless. Rostrum (80–92.5 long; 35–40 wide). Chelicerae (285– 310 long) with curved fangs (62.5–65 long). Subcapitular proportions: ventral length/ height 2.04–2.07; rostrum length/width 2.13–2.36. **Pedipalps** short and stocky (especially tibiae) without extensions on femora and genua. Palpomeres: trochanter (30– 31.25 long); femur (58.75–72.5 long); genu (60–62.5 long); tibia (32.5–37.5 long; 17.5–17.5 wide); tarsus (15–15 long). Palpomere proportions: femur/genu 0.98–1.16; tibia/femur 0.48–0.55; tibia length/width 1.86–2.14.

Venter — (800–960 long; 485–510 wide) colorless. Gnathosomal bay (192.5–205 long; 40–50 wide). Cxgl-4 apical. **Medial suture** (105–125 long). **Genital plates** (160–177.5 long; 120–125 wide). Additional measurements: Cx-1 (305–330 long (to-tal); 115–130 long (medial)); Cx-3 (320–325 wide); anterior venter (235–262.5 long). Ventral proportions: gnathosomal bay length/width 3.85–5.00; anterior venter/genital field length 1.38–1.59; anterior venter length/genital field width 1.96–2.13; anterior venter/medial suture 2.00–2.24.

IMMATURES unknown.

Etymology. Viets (1977a) named the specific epithet (*boettgeri*) in honor of Klaus Böttger of the University of Kiel, Germany, who collected the type specimen in Rio Chilax near Cobán, Guatemala.

Distribution. New Mexico (probably also Arizona) and extending southward into Mexico and Guatemala (Figure 29).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola boettgeri* and therefore this species is not included in our phylogenetic analyses. We were also unable to examine types, but were able to examine new material from New Mexico. The overall appearance, incomplete hind coxal margins, distribution, and lack of coloration are consistent with placing this species in the Rala Identification Group.

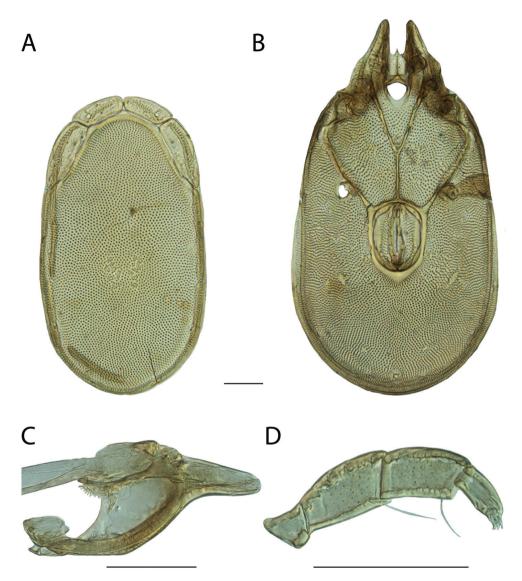

Figure 31. *Torrenticola boettgeri* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

Viets (1977a) described *T. boettgeri* from a single female collected in Guatemala. Cramer (1992) described *T. esbelta* from three females collected in one stream (Peña Blanca) in San Francisco Oxtotilpan, State of Mexico, Mexico. Cramer (1992) differentiated *T. esbelta* from *T. boettgeri* by pedipalpal tibia length: 36 μ m in *T. esbelta*; 26-27 μ m (right, left, respectively). Given our experience with the variability of tibial length across species, which often range well over 10 μ m, and especially considering the very few number of specimens examined, we do not consider slight variations in pedipalp tibial length to be good evidence for separate species. Furthermore, our material from New Mexico includes specimens with tibiae in between the previously recorded specimens (32.5 μ m in our single female specimen; 32.5–37.7 μ m in males). Therefore, we consider *T. esbelta* as a junior synonym of *T. boettgeri*.

Torrenticola bondi Fisher & Dowling, sp. n. http://zoobank.org/41C5A481-7EF0-4E1E-AD87-CD12DBFBA107

Material examined. HOLOTYPE (\mathcal{Q}): from USA, North Carolina, Haywood County, Great Smokey Mountains National Park, Cataloochee (35°37'31"N, 83°6'46"W), 20 Sep 2010, by IM Smith, IMS100148, DNA 1431.

Type deposition. Holotype (\bigcirc) , allotype (\heartsuit) , and some paratypes $(2 \bigcirc; 2 \circlearrowright)$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola bondi are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (*T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba,* and *T. shubini*), Elongata Group (*T. elongata, T. gorti,* and *T. reduncarostra*), Neoanomala Group (*T. interiorensis* and *T. neoanomala*), and *T. erectirostra, T. robisoni, T. irapalpa, T. racupalpa, T. skvarlai*, and *T. arktonyx.* They can be differentiated from Rusetria 4-Plates and *T. skvarlai* by having distinct hind coxal margins. *T. bondi* can be differentiated from *T. erectirostra* and *T. robisoni* by having a straight, anteriorly-directed rostrum (upturned in others). *T. bondi* can be differentiated from *T. arktonyx* has distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly). *T. bondi* can be differentiated from *T. racupalpa* and *T. irapalpa* by having a more ovoid dorsum (dorsum length/width Q = 1.35-1.41 in *T. bondi*, 1.17–1.28 in others; $\mathcal{J} = 1.32-1.45$ in *T. bondi*, 1.20–1.30 in others) and shorter pedipalpal tibiae (Q = 90-98 in *T. bondi*, 100–125 in others, $\mathcal{J} = 77-83$ in *T. bondi*, 87–110 in others). *T. bondi* can be differentiated from the Elongata Group by having a less elongate dorsum (length/

Figure 32. Torrenticola bondi sp. n. distribution.

width $\mathcal{Q} = 1.35-1.41$ in *T. bondi*, 1.45–2.08 in Elongata Group; $\mathcal{J} = 1.32-1.45$ in *T. bondi*, 1.51–1.70 in Elongata Group) and having a stockier rostrum (length/width = 2.76–3.13 in *T. bondi*, 3.24–4.00 in Elongata Group). *T. bondi* can be differentiated from the Neoanomala Group by having a shorter medial suture ($\mathcal{Q} = 10-15$ in *T. bondi*, 22–40 in Neoanomala Group; $\mathcal{J} = 55-70$ in *T. bondi*, 75–108 in Neoanomala Group) and anterior venter/genital field width ($\mathcal{Q} = 1.15-1.25$ in *T. bondi*, 1.31–1.45 in Neoanomala Group; $\mathcal{J} = 1.95-2.05$ in *T. bondi*, 2.09–2.66 in Neoanomala Group).

Description. FEMALE (Figure 33) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (620–670 (620) long; 440–490 (440) wide) ovoid with bluish-purple coloration separated into anterior and posterior portions and faint orange medially. Anterio-medial platelets (132.5–147.5 (132.5) long; 55–62.5 (55) wide). Anterio-lateral platelets (192.5–200 (192.5) long; 67.5–77.5 (67.5) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 270–290 (270)). Dorsal plate proportions: dorsum length/width 1.35–1.41 (1.41); dorsal width/distance between Dgl-4 1.63–1.72 (1.63); anterio-medial platelet length/width 2.20–2.52 (2.41); anterio-lateral platelet length/width 2.58–2.85 (2.85); anterio-lateral/anterio-medial length 1.34–1.41 (1.45).

Gnathosoma — Subcapitulum (355–380 (355) long (ventral); 255–295 (255) long (dorsal); 135–150 (135) tall) faint bluish purple coloration. Rostrum (145–155

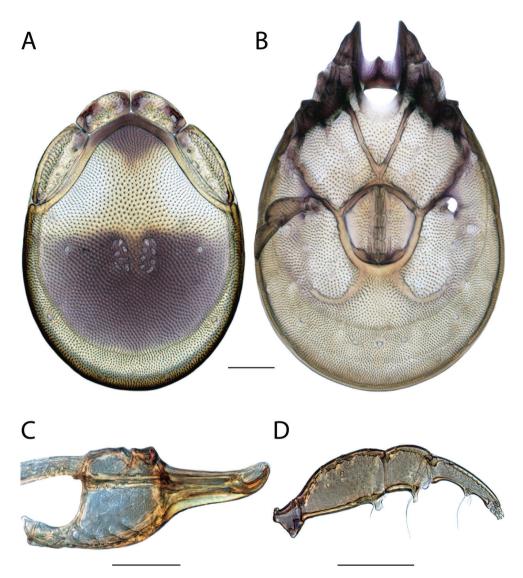

Figure 33. *Torrenticola bondi* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(145) long; 50–55 (52.5) wide). Chelicerae (354–385 (354) long) with curved fangs 52–75 (52) long). Subcapitular proportions: ventral length/height 2.50–2.63 (2.63); rostrum length/width 2.76–3.00 (2.76). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter 47.5–52.5 (47.5) long); femur (120–140 (120) long); genu (67.5–77.5 (67.5) long); tibia (90–97.5 (92.5) long; 22.5–25 (22.5) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.74–1.83 (1.78); tibia/femur 0.67–0.77 (0.77); tibia length/width 3.90–4.11 (4.11).

Venter — (760–840 (760) long; 509–580 (509) wide) with faint bluish-purple coloration. Gnathosomal bay (170–190 (170) long; 90–102.5 (102.5) wide). Cxgl-4 subapical. **Medial suture** (10–15 (10) long). **Genital plates** (175–180 (175) long; 150–160 (150) wide). Additional measurements: Cx-1 (306–330 (306) long (total); 108–155 (108) long (medial)); Cx-3 (365–410 (382) wide); anterior venter (177.5–187.5 (187.5) long). Ventral proportions: gnathosomal bay length/width 1.66–2.11 (1.66); anterior venter/genital field length 0.99–1.07 (1.07); anterior venter length/ genital field width 1.15–1.25 (1.25); anterior venter/medial suture 12–18.75 (18.75).

MALE (Figure 34) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (515–550 (550) long; 380–410 (380) wide) ovoid with bluish-purple coloration separated into anterior and posterior portions and faint orange medially. Anterio-medial platelets (112.5–122.5 (122.5) long; 47.5–57.5 (57.5) wide). Anterio-lateral platelets (162.5–190 (180) long; 55–67.5 (67.5) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 235–260 (250)). Dorsal plate proportions: dorsum length/width 1.32–1.45 (1.45); dorsal width/distance between Dgl-4 1.48–1.62 (1.52); anterio-medial platelet length/width 2.13–2.47 (2.13); anterio-lateral platelet length/width 2.65–3.17 (2.67); anterio-lateral/anterio-medial length 1.44–1.57 (1.47).

Gnathosoma — **Subcapitulum** (295–305 (305) long (ventral); 220–230 (225) long (dorsal); 107.5–112.5 (112.5) tall) faint bluish purple coloration. Rostrum (120–125 (125) long; 40–40 (40) wide). Chelicerae (285–295 (290) long) with curved fangs 50–55 (55) long). Subcapitular proportions: ventral length/height 2.68–2.79 (2.71); rostrum length/width 3.00–3.13 (3.13). Pedipalps with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter 40–42.5 (42.5) long); femur (102.5–107.5 (105) long); genu (60–62.5 (60) long); tibia (77.5–82.5 (77.5) long; 21.25–23.75 (22.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.68–1.75 (1.75); tibia/femur 0.74–0.80 (0.74); tibia length/width 3.44–3.88 (3.44).

Venter — (660–670 (665) long; 420–490 (460) wide) with faint bluish-purple coloration. Gnathosomal bay (140–150 (142.5) long; 75–90 (80) wide). Cxgl-4 sub-apical. **Medial suture** (55–70 (60) long). **Genital plates** (132.5–142.5 (140) long; 107.5–112.5 (110) wide). Additional measurements: Cx-1 (270–290 (285) long (total); 125–140 (135) long (medial)); Cx-3 (310–340 (335) wide); anterior venter (215–220 (220) long). Ventral proportions: gnathosomal bay length/width 1.61–1.93 (1.78); anterior venter/genital field length 1.54–1.66 (1.57); anterior venter length/ genital field width 1.95–2.05 (2.00); anterior venter/medial suture 3.07–3.91 (3.67).

IMMATURES unknown.

Etymology. Specific epithet (*bondi*) named in honor of arachnologist Jason Bond, for his research on species delimitation and integrative taxonomy, which has been an inspiration to JRF, and for his thoughtful career advice, which was greatly appreciated.

Distribution. Known only from Great Smoky Mountains National Park, Haywood County, North Carolina (Figure 32).

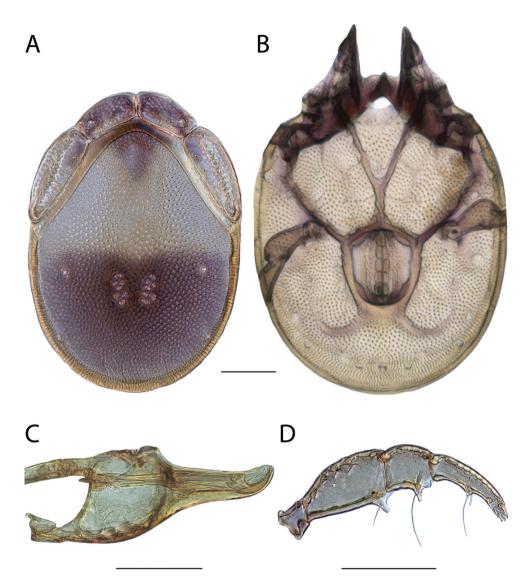

Figure 34. *Torrenticola bondi* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Remarks. Torrenticola bondi groups with other members of the Raptor Complex in all analyses with high support. Only one specimen could be acquired for use in our analyses, so differences in COI sequence across specimens could not be investigated, but this single specimen was greater than 5% different in COI sequence from sister species. In all analyses, *T. bondi* grouped with members of the Elongata Identification Group (*T. elongata* and *T. gorti*). However, the position of this clade varied with analysis.

This species hypothesis is supported by high divergence between species (3-15%) and by the morphological characters outlined in the diagnosis.

Torrenticola caerulea Fisher & Dowling, sp. n. http://zoobank.org/3222693B-DEA0-4BC2-94B1-CC061A2C9730

Material examined. HOLOTYPE (\bigcirc): from USA, Tennessee, Wayne County, beside service road parallel to Natchez Trace Parkway (35°15'9"N, 87°37'53"W), 27 Sep 2010, by IM Smith, IMS100160, DNA 1882.

PARATYPES (5 \bigcirc ; 3 \bigcirc): **Tennessee, USA**: 2 \bigcirc from Wayne County, beside Natchez Trace Parkway at Lower Glenrock Branch Picnic Area, (35°15'15"N, 87°37'37"W), 2 June 1992, by IM Smith, IMS920021 • 1 \bigcirc (ALLOTYPE) from Wayne County, Lower Glenrock Picnic Area off Natchez Trace Parkway, (35°15'15"N, 87°37'37"W), 5 October 2005, by IM Smith, IMS050119A • 1 \bigcirc and 2 \bigcirc from Wayne County, Lower Glenrock Picnic Area off Natchez Trace Parkway, (35°15'15"N, 87°37'37"W), 5 October 2005, by IM Smith, IMS050119A • 2 \bigcirc from Wayne County, beside service road parallel to Natchez Trace Parkway (35°15'9"N, 87°37'53"W), 27 Sep 2010, by IM Smith, IMS100160.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(3 \bigcirc; 1 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola caerulea are similar to other members of the Rusetria "Eastern 2-Plates" group (T. biscutella, T. delicatexa, T. feminellai, T. indistincta, T. malarkeyorum, T. microbiscutella, T. pendula, T. sellersorum, T. tysoni, T. ululata, and T. whitneyae) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except T. ululata and T. indistincta), and being distributed in the east. T. caerulea can be differentiated from all other Eastern 2-Plates by having faint blue coloration. T. caerulea can be differentiated from T. ululata and T. feminellai by dorsal coloration and pattern. T. caerulea can be differentiated from T. tysoni by having a less elongate rostrum (length/width = 2.67-2.96 in T. caerulea, 3.06-3.50 in T. tysoni). T. caerulea can be differentiated from *T. pendula* by having a more elongate gnathosomal bay (1.40–2.09 in *T. caerulea*, 2.42–2.90 in T. pendula) and more elongate pedipalpal tibiae (3.11–3.83 in T. caerulea, 2.78-3.05 in T. pendula). T. caerulea can be differentiated from T. microbiscutella by having a less elongate dorsum (length/width = 1.32–1.56 in T. caerulea, 1.63–1.75 in T. microbiscutella). T. caerulea can be differentiated from T. whitneyae by having more elongate pedipalpal tibiae (length/width = 3.11-3.83 in T. caerulea, 2.42-2.95 in *T. whitneyae*) and by anterior venter/genital field width ($\bigcirc = 0.9-1.04$ in *T. caerulea*, 0.67-0.80 in *T. whitneyae*; $\mathcal{F} = 1.71-1.83$ in *T. caerulea*, 1.5-1.54 in *T. whitneyae*). Female T. caerulea can be differentiated from female T. biscutella by having slightly more elongate pedipalpal tibae (length/width = 3.5-3.83 in T. caerulea, 3.35-3.45 in T. biscutella). Male T. caerulea can be differentiated from male T. biscutella by anterior venter/medial suture (2.4-2.57 in T. caerulea, 2.68-2.83 in T. biscutella). Female T. caerulea can be differentiated from female T. malarkeyorum, T. sellersorum, T. delicatexa, and T. indistincta by having a thinner genital field (120-145 in T. caerulea, 150–205 in others). Male T. caerulea can be differentiated from male T. indistincta by having a smaller dorsum (length = 405-460 in T. caerulea, 480-645 in T. indistincta;

Figure 35. Torrenticola caerulea sp. n. distribution.

width = 260–305 in *T. caerulea*, 315–470 in *T. indistincta*). Body proportions of male *T. caerulea* do not differ from male *T. malarkeyorum*, *T. sellersorum*, and *T. delicatexa*, but can be differentiated by dorsal coloration.

Description. FEMALE (Figure 36) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–600 (580) long; 400–440 (440) wide) ovoid with faint blue coloration anteriorly and posteriorly, broadly connected medially. Anterio-medial platelets (125–130 (128.75) long; 40–45 (42.5) wide). Anterio-lateral platelets (145–157.5 (145) long; 57.5–65 (62.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 275–320 (320)). Dorsal plate proportions: dorsum length/width 1.32–1.48 (1.32); dorsal width/distance between Dgl-4 1.25–1.51 (1.38); anterio-medial platelet length/width 2.78–3.25 (3.03); anterio-lateral platelet length/width 2.32–2.48 (2.32); anterio-lateral/anterio-medial length 1.12–1.21 (1.13).

Gnathosoma — **Subcapitulum** (310–330 (320) long (ventral); 225–245 (240) long (dorsal); 137.5–156.25 (155) tall) colorless. Rostrum (120–135 (125) long; 45–47.5 (45) wide). Chelicerae (310–330 (320) long) with curved fangs (62–70 (65) long). Subcapitular proportions: ventral length/height 2.06–2.25 (2.06); rostrum length/ width 2.67–2.84 (2.78). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–48.75 (48.75) long); femur (115–120 (120) long); genu (67.5–72.5 (72.5) long); tibia (85–87.5 (87.5) long; 22.5–25 (25) wide); tarsus

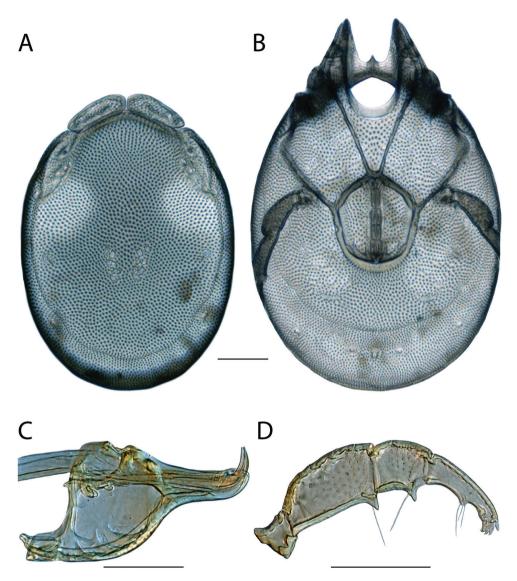

Figure 36. *Torrenticola caerulea* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(17.5–20 (20) long). Palpomere proportions: femur/genu 1.66–1.78 (1.66); tibia/femur 0.71–0.76 (0.73); tibia length/width 3.50–3.83 (3.50).

Venter — (620–750 (660) long; 400–580 (660) wide) with faint blue coloration. Gnathosomal bay (145–175 (145) long; 82.5–116.25 (95) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (155–165 (155) long; 140–145 (145) wide). Additional measurements: Cx-1 (257.5–305 (257.5) long (total); 125–135 (125) long (medial)); Cx-3 (310–380 (380) wide); anterior venter (130–150 (137.5) long). Ventral proportions: gnathosomal bay length/width 1.40–1.94 (1.53); anterior venter/genital field length 0.82–0.97 (0.89); anterior venter length/genital field width 0.90–1.04 (0.95).

MALE (Figure 36) (n = 3) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (405–460 (460) long; 260–305 (300) wide) ovoid with faint blue coloration anteriorly and posteriorly, broadly connected medially. Anterio-medial platelets (95–106.25 (106.25) long; 35–37.5 (35) wide). Anterio-lateral platelets (117.5–130 (125) long; 40–47.5 (45) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 190–240 (230)). Dorsal plate proportions: dorsum length/width 1.51–1.56 (1.53); dorsal width/distance between Dgl-4 1.27–1.37 (1.30); anterio-medial platelet length/width 2.53–3.04 (3.04); anterio-lateral platelet length/width 2.74–2.94 (2.78); anterio-lateral/anterio-medial length 1.18–1.24 (1.18).

Gnathosoma — **Subcapitulum** (220–242.5 (227.5) long (ventral); 165–185 (165) long (dorsal); 87.5–97.5 (97.5) tall) colorless. Rostrum (88.75–92.5 (92.5) long; 30–35 (33.75) wide). Chelicerae (225–232.5 (227.5) long) with curved fangs (42.5–50 (45) long). Subcapitular proportions: ventral length/height 2.33–2.51 (2.33); rostrum length/width 2.64–2.96 (2.74). Pedipalps with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–37.5 (37.5) long); femur (83.75–87.5 (87.5) long); genu (52.5–55 (55) long); tibia (67.5–70 (67.5) long; 20–22.5 (20) wide); tarsus (15–20 (17.5) long). Palpomere proportions: femur/genu 1.59–1.60 (1.59); tibia/femur 0.77–0.81 (0.77); tibia length/width 3.11–3.38 (3.38).

Venter — (485–550 (550) long; 305–340 (330) wide) with faint blue coloration. Gnathosomal bay (120–127.5 (125) long; 57.5–65 (60) wide). Cxgl-4 subapical. **Medial suture** (65-75 (75)). **Genital plates** (110–117.5 (117.5) long; 90–105 (102.5) wide). Additional measurements: Cx-1 (220–220 (220) long (total); 85–95 (95) long (medial)); Cx-3 (240–260 (260) wide); anterior venter (165–180 (180) long). Ventral proportions: gnathosomal bay length/width 1.96–2.09 (2.08); anterior venter/genital field length 1.50–1.57 (1.53); anterior venter length/genital field width 1.71–1.83 (1.76).

IMMATURES unknown.

Etymology. Specific epithet (*caerulea*) refers to the overall and diagnostic bluish appearance of this species (*caeruleus*, L. sky-blue).

Distribution. Known only from Wayne County, Tennessee (Figure 35). *T. caeru-lea* has been collected so rarely that comments about distribution are speculative, but given our collection efforts, it is reasonable to speculate that this species is at least restricted to the southern Appalachians.

Remarks. Torrenticola caerulea groups with other members of the Rusetria Complex with high support and specimens of this species were less than 1% different in COI sequence from each other. In all analyses, *T. caerulea* groups with two other morphologically similar species: *T. biscutella* and *T. malarkeyorum*. These three species are

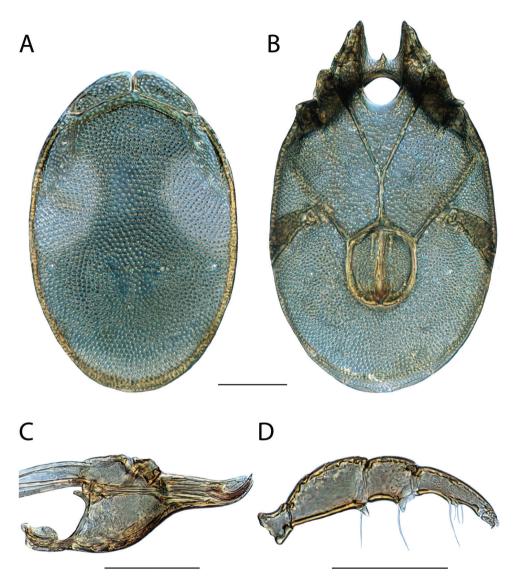

Figure 37. *Torrenticola caerulea* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

3–5% different from each other in COI sequence. The three of these species are morphologically similar to the more distantly-related *T. delicatexa*, but *T. caerulea* can be differentiated from all of these by color. The range of *T. caerulea* overlaps with each of these except for *T. biscutella*, which is not known from east of the Mississippi River.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(5 \bigcirc; 4 \textcircled{O})$ deposited in the CNC; other paratypes $(4 \heartsuit; 3 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola cardia are similar to other members of the Tricolor Complex (T. bittikoferae, T. dimorpha, T. hoosieri, T. kringi, T. larvata, T. mohawk, T. pearsoni, T. olliei, T. sierrensis, T. tricolor, T. trimaculata, and T. unimaculata,) in having a short, conical rostrum. T. cardia can be differentiated from most Torrenticola, including other members of the Tricolor Complex, by having a distinct dorsal pattern. T. cardia are most similar to other members of the Tricolor Complex that have bold patterning (T. larvata, T. tricolor, T. unimaculata, T. trimaculata, T. kringi, and T. mohawk). T. cardia can be differentiated from T. tricolor, T. trimaculata, T. kringi, and T. mohawk by having a more ovoid dorsum (length/width Q = 1.39-1.47 in *T. cardia*, 1.15-1.35 in others; $\delta = 1.43 - 1.54$ in *T. cardia*, 1.19 - 1.39 in others). *T. cardia* can be differentiated from T. unimaculata by dorsal pattern. Female T. cardia can be differentiated from female *T. larvata* by having a shorter subcapitulum (Q = 265-273 in *T. cardia*, 275–288 in *T. larvata*) and a larger genital field (length \mathcal{Q} = 190–198 in *T. cardia*, 182–188 in *T. larvata*; width Q = 160-175 in *T. cardia*, 145–153 in *T. larvata*). Male T. cardia can be differentiated from male T. larvata by having less elongate pedipalpal tibiae (length/width \bigcirc = 2.82–3.05 in *T. cardia*, 3.10–3.20 in *T. larvata*) and a larger dorsum (length \bigcirc = 625–670 in *T. cardia*, 550–610 in *T. larvata*; width \bigcirc = 405–445 in T. cardia, 350-400 in T. larvata).

Description. FEMALE (Figure 39) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (710–785 (750) long; 510–555 (510) wide) ellipsoid with reddish-purple, bluish-purple or bright orange spot medially extending in a strip anteriorly often to the anterior-medial platelets. Anterio-medial platelets (130–140 (140) long; 70–75 (75)

Figure 38. Torrenticola cardia sp. n. distribution.

wide). Anterio-lateral platelets (195–207.5 (197.5) long; 70–80 (80) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 390–410 (395)). Dorsal plate proportions: dorsum length/width 1.39–1.47 (1.47); dorsal width/distance between Dgl-4 1.29–1.35 (1.29); anterio-medial platelet length/width 1.86–2.00 (1.87); anterio-lateral platelet length/width X=2.47–2.93 (2.47); anterio-lateral/anterio-medial length 1.39–1.50 (1.41).

Gnathosoma — **Subcapitulum** (265–272.5 (272.5) long (ventral); 180–190 (190) long (dorsal); 125–132.5 (130) tall) with reddish-purple or bluish purple coloration. Rostrum (90–100 (100) long; 40–42.5 (40) wide) short and conical. Chelicerae (250–265 (260) long) with curved fangs (60–60 (60) long). Subcapitular proportions: ventral length/height 2.04–2.12 (2.10); rostrum length/width 2.24–2.50 (2.50). **Pedipalps** with stocky, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (38.75–42.5 41.25) long); femur (97.5–107.5 (102.5) long); genu (65–70 (67.5) long); tibia (80–91.25 (80) long; 26.25–27.5 (27.5) wide); tarsus (22.5–25 (22.5) long). Palpomere proportions: femur/genu 1.50–1.56 (1.52); tibia/femur 0.78–0.87 (0.78); tibia length/width 2.91–3.32 (2.91).

Venter — (830–925 (850) long; 565–600 (565) wide) with reddish-purple or bluish-purple coloration restricted to the edges of the gnathosomal bay, coxal plates, and genital plates. Gnathosomal bay (150–162.5 (155) long; 72.5–80 (72.5) wide). Cxgl-4 subapical. **Medial suture** (25–50 (50) long). **Genital plates** (190–197.5 (190) long; 160–175 (162.5) wide). Additional measurements: Cx-1 (290–310 (290) long (total);

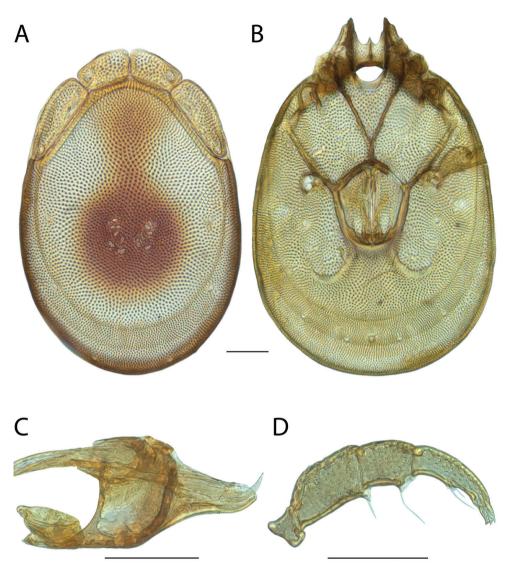

Figure 39. *Torrenticola cardia* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

135–165 (135) long (medial)); Cx-3 (355–380 (355) wide); anterior venter (185–212.5 (205) long). Ventral proportions: gnathosomal bay length/width 1.94–2.17 (2.14); anterior venter/genital field length 0.94–1.09 (1.08); anterior venter length/ genital field width 1.12–1.26 (1.26); anterior venter/medial suture 4.10–7.60 (4.10).

MALE (Figure 40) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (625–670 (670) long; 405–445 (445) wide) ellipsoid with reddishpurple, bluish-purple or bright orange spot medially extending in a strip anteriorly

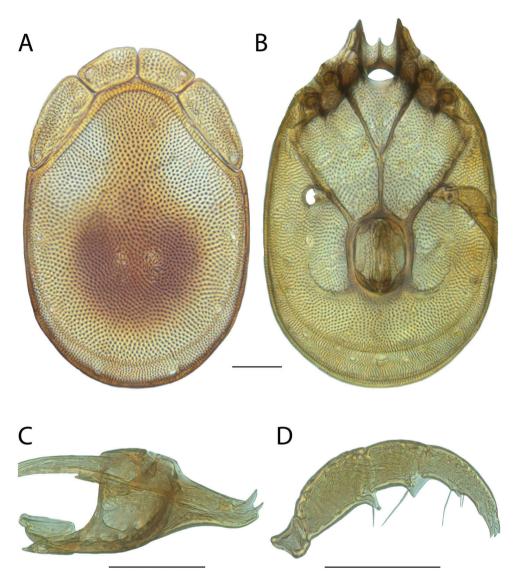

Figure 40. *Torrenticola cardia* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

often to the anterior-medial platelets. Anterio-medial platelets (120–130 (125) long; 65–72.5 (70) wide). Anterio-lateral platelets (170–197.5 (197.5) long; 75–80 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 325–380 (380)). Dorsal plate proportions: dorsum length/width 1.43–1.54 (1.51); dorsal width/distance between Dgl-4 1.17–1.28 (1.17); anterio-medial platelet length/width 1.72–2.00 (1.79); anterio-lateral platelet length/width 2.25–2.63 (2.63); anterio-lateral/anterio-medial length 1.35–1.58 (1.58).

Gnathosoma — **Subcapitulum** (227.5–250 (250) long (ventral); 165–180 (170) long (dorsal); 90–112.5 (110) tall) with reddish-purple or bluish purple coloration. Rostrum (77.5–92.5 (90) long; 32.5–37.5 (37.5) wide) short and conical. Chelicerae (212.5–230 (225) long) with curved fangs (50–55 (50) long). Subcapitular proportions: ventral length/height 2.17–2.56 (2.27); rostrum length/width 2.27–2.47 (2.40). Pedipalps with stocky, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (36.25–38.75 (36.25) long); femur (87.5–97.5 (92.5) long); genu (60–67.5 (62.5) long); tibia (73.75–82.5 (77.5) long; 25–27.5 (27.5) wide); tarsus (20–25 (22.5) long). Palpomere proportions: femur/genu 1.38–1.48 (1.48); tibia/femur 0.82–0.90 (0.84); tibia length/width 2.82–3.05 (2.82).

Venter — (710–780 (780) long; 460–495 (490) wide) with reddish-purple or bluish-purple coloration restricted to the edges of the gnathosomal bay, coxal plates, and genital plates. Gnathosomal bay (125–137.5 (135) long; 67.5–72.5 (70) wide). Cxgl-4 subapical. **Medial suture** (107.5–130 (125) long). **Genital plates** (150–175 (175) long; 97.5–115 (105) wide). Additional measurements: Cx-1 (265–280 (280) long (total); 140–150 (145) long (medial)); Cx-3 (325–355 (350) wide); anterior venter (265–290 (290) long). Ventral proportions: gnathosomal bay length/width 1.85–1.93 (1.93); anterior venter/genital field length 1.66–1.81 (1.66); anterior venter length/ genital field width 2.52–2.77 (2.76); anterior venter/medial suture 2.21–2.51 (2.32).

IMMATURES unknown.

Etymology. Specific epithet (*cardia*) refers to the dorsal coloration, which is either a heart-shaped or resembles a bleeding heart (*kardiá*, G. heart).

Distribution. Appalachians (Figure 38).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola cardia* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, short conical rostrum that is downturned in the male, and distribution, are consistent with placing this species in the Tricolor Complex and Tricolor Identification Group.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and other paratypes (15 \bigcirc ; 20 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola copipalpa are similar to members of the Miniforma group (*T. manni*, *T. miniforma*, *T. oliveri*, *T. pacificensis*, *T. pinocchio*, and *T. rockyensis*) in having short, stocky pedipalps (except *T. oliveri* and *T. pinocchio*); similar pedipalpal extensions (unique to members of this group); and being among the smallest *Torrenticola* in the west (dorsum 500–625 long) (except *T. oliveri*). *T. copipalpa* are best differentiated from all other Miniforma group (except *T. pinocchio*) by having broad, flat pedipalp femoral tubercles (conical/tuberculate in all others). *T. copipalpa* can be differentiated from *T. pinocchio* by having a less elongate rostrum (length/width = 2.5–3.0 in *T. copipalpa*, 4.5–4.9 in *T. pinocchio*) and less elongate pedipalpal tibiae (length/width = 2.4–2.9 in *T. copipalpa*, 3.1–3.5 in *T. pinocchio*).

Description. FEMALE (Figure 42) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (555–605 (605) long; 380–420 (420) wide) ovoid and usually colorless, occasionally with faint purple coloration without distinct pattern. Anterio-medial platelets (115–127.5 (127.5) long; 47.5–57.5 (57.5) wide). Anterio-lateral platelets (162.5–180 (180) long; 53.75–62.5 (62.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 290–335 (335)). Dorsal plate proportions: dorsum length/width 1.39–1.47 (1.44); dorsal width/distance between Dgl-4 1.25–1.32 (1.25); anterio-medial platelet length/ width 2.13–2.42 (2.22); anterio-lateral platelet length/width 2.87–3.04 (2.88); anterio-lateral/anterio-medial length 1.35–1.46 (1.41).

Gnathosoma — **Subcapitulum** (312.5–337.5 (337.5) long (ventral); 228–257.5 (257.5) long (dorsal); 117.5–130 (125) tall) colorless. Rostrum (122.5–135 (130) long; 42.5–47.5 (45) wide). Chelicerae (313–341 (340) long) with curved fangs (50–59 (55) long). Subcapitular proportions: ventral length/height 2.58–2.70 (2.70); rostrum length/width 2.72–2.94 (2.89). **Pedipalps** short and stocky (especially tibiae) with broad, dentate, and anteriorly-directed ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (30–35 (35) long); femur (90–100 (97.5) long); genu (62.5–67.5 (67.5) long); tibia (52.5–58.75 (57.5) long; 20–22.5 (21.25) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.44–1.51 (1.41); tibia/femur 0.55–0.61 (0.59); tibia length/width 2.59–2.71 (2.71).

Venter — (690–760 (760) long; 438–520 (520) wide) colorless. Gnathosomal bay (136.25–152.5 (152.5) long; 75–82.5 (80) wide). Cxgl-4 subapical. **Medial suture** (40–45 (45) long). **Genital plates** (152.5–165 (165) long; 137.5–160 (160) wide). Additional measurements: Cx-1 (261–290 (290) long (total); 108–155 (155) long

(medial)); Cx-3 (268–320 (320) wide); anterior venter (187.5–210 (210) long). Ventral proportions: gnathosomal bay length/width 1.65–1.97 (1.91); anterior venter/genital field length 1.19–1.28 (1.27); anterior venter length/genital field width 1.31–1.40 (1.31); anterior venter/medial suture 4.53–4.88 (4.67).

MALE (Figure 43) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (500–570 (520) long; 355–390 (360) wide) ovoid and usually colorless, occasionally with faint purple coloration without distinct pattern. Anterio-medial

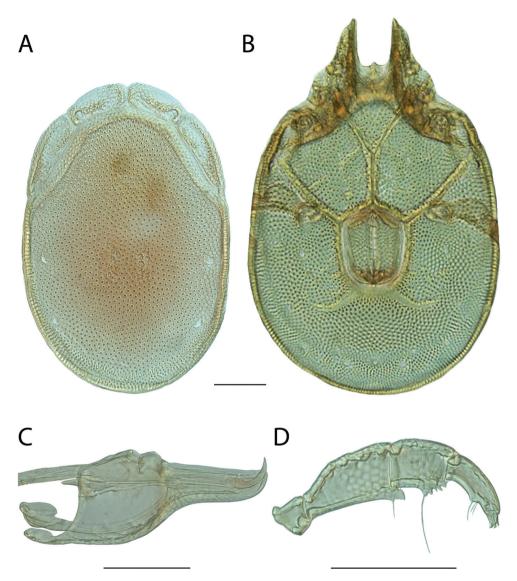

Figure 43. *Torrenticola copipalpa* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

platelets (105–117.5 (105) long; 45–56.25 (45) wide). Anterio-lateral platelets (155–167.5 (155) long; 50–60 (50) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 285–315 (290)). Dorsal plate proportions: dorsum length/width 1.39–1.54 (1.44); dorsal width/distance between Dgl-4 1.18–1.37 (1.24); anterio-medial platelet length/width 2.09–2.37 (2.33); anterio-lateral platelet length/width 2.79–3.10 (3.10); anterio-lateral/anterio-medial length 1.32–1.48 (1.48).

Gnathosoma — **Subcapitulum** (280–307.5 (295) long (ventral); 215–253 (220) long (dorsal); 105–115 (105) tall) colorless. Rostrum (110–120 (115) long; 40–46.25 (40) wide). Chelicerae (280–328 (295) long) with curved fangs (45–65 (55) long). Subcapitular proportions: ventral length/height 2.67–2.81 (2.81); rostrum length/width 2.54–2.88 (2.88). Pedipalps short and stocky (especially tibiae) with broad, dentate, and anteriorly-directed ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (32.5–32.5 (32.5) long); femur (82.5–92.5 (87.5) long); genu (57.5–65 (60) long); tibia (52.5–57.5 (52.5) long; 18.75–21.25 (21.25) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.35–1.54 (1.46); tibia/femur 0.60–0.64 (0.60); tibia length/width 2.47–2.88 (2.47).

Venter — (610–700 (670) long; 420–496 (440) wide) colorless. Gnathosomal bay (110–140 (130) long; 67.5–75 (75) wide). Cxgl-4 subapical. **Medial suture** (77.5–97.5 (77.5) long). **Genital plates** (130–137.5 (130) long; 100–112.5 (105) wide). Additional measurements: Cx-1 (235–263 (245) long (total); 115–130 (130) long (medial)); Cx-3 (270–300 (280) wide); anterior venter (210–232.5 (217.5) long). Ventral proportions: gnathosomal bay length/width 1.63–1.87 (1.73); anterior venter/genital field length 1.62–1.77 (1.67); anterior venter length/genital field width 2.04–2.21 (2.07); anterior venter/medial suture 2.36–2.88 (2.81).

IMMATURES unknown.

Etymology. Specific epithet (*copipalpa*) refers to the blade-like pedipalp femoral tubercles (*copis*, L. small knife; *palpus*, L. hand, feeler), which distinguish them from similar, co-occurring species.

Distribution. Northern California and western Oregon (Figure 41).

Remarks. Torrenticola copipalpa groups with other members of the Miniforma Complex with high support and specimens of this species are less than 1% different in COI sequence from each other. In all analyses, *T. copipalpa* groups with three other morphologically similar species: *T. pacificensis, T. manni*, and *T. rockyensis*. These three species are greater than 4% different from each other. This species overlaps with *T. miniforma* in California and with *T. pacificensis* in west-central Oregon.

Based upon overall similarity, the pedipalp genu extensions, and western distribution, we were able to place this species in the Miniforma Identification Group.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola daemon Fisher & Dowling, sp. n.

http://zoobank.org/5ACD786A-B621-48B1-9480-CB7B58CE3438

Material examined. HOLOTYPE (\mathcal{Q}): from USA, Alabama, Clay County, beside Forest Route 649, 0.8 km northeast of road from Campbell Springs to Forest Route 600, (33°22'22"N, 85°52'52"W), 3 July 1990, by IM Smith, IMS900075A.

PARATYPES (4 \bigcirc ; 4 \eth): **Alabama, USA**: 1 \circlearrowright (ALLOTYPE) from Clay County, beside Forest Route 649, 0.8 km northeast of road from Campbell Springs to Forest Route 600, (33°22'22"N, 85°52'52"W), 3 July 1990, by IM Smith, IMS900075A • 4 \bigcirc and 3 \circlearrowright from Clay County, beside Forest Route 649, 0.8 km northeast of road from Campbell Springs to Forest Route 600, (33°22'22"N, 85°52'52"W), 3 July 1990, by IM Smith, IMS900075A

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \textcircled{O})$ deposited in the ACUA.

Diagnosis. *Torrenticola daemon* are similar to other members of the Raptor Group (*T. danielleae, T. elusiva, T. gnoma, T. irapalpa, T. ivyae, T. longitibia, T. mjolniri, T. racupalpa,* and *T. raptor*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. daemon* can be differentiated from all other Raptor Group by having Dgl-4 closer to the edge of the dorsum (dorsum width/distance between Dgl-4 \bigcirc = 1.59–1.67 in *T. daemon,* 1.80–3.29 in others; \Diamond = 1.45–1.65 in *T. daemon,* 1.66–2.73 in others), except *T. irapalpa* (\bigcirc = 1.81–2.09, \Diamond = 1.58–1.86) and *T. danielleae* (\bigcirc = 1.57–1.70, \Diamond = 1.42–1.52). *T. daemon* can be differentiated from *T. longitibia, T. mjolniri, T. elusiva, T. racupalpa, T. raptor, T. danielleae*, and *T. ivyae* by having a less elongate rostrum (length/width = 2.91–3.31 in *T. daemon,* 3.43–4.40 in others). Female *T. daemon* can be differentiated from female *T. irapalpa* by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 \bigcirc = 1.59–1.67 in *T. daemon,* 1.81–2.09 in *T. irapalpa*) and a more elongate gnathosomal bay (length/width \bigcirc = 1.95–2.42 in *T. daemon,* 1.35–1.86 in *T. irapalpa*). Additionally, *T. daemon* can be differentiated from *T. irapalpa*).

Description. FEMALE (Figure 45) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–655 (640) long; 460–500 (490) wide) circular with faint reddish-purple coloration separated into anterior and posterior portions, with bright reddish-purple coloration on the anterior-medial platelets, occasionally extending onto the dorsal plate. Anterio-medial platelets (127.5–147.5 (145) long; 57.5–67.5 (65) wide). Anterio-lateral platelets (182.5–210 (210) long; 72.5–82.5 (82.5) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 285–300 (300)). Dorsal plate proportions: dorsum length/width 1.26–1.34 (1.31); dorsal width/distance between Dgl-4 1.59–1.67 (1.63); anterio-medial platelet length/width 2.04–2.28 (2.23); anteriolateral platelet length/width 2.28–2.66 (2.55); anterio-lateral/anterio-medial length 1.29–1.51 (1.45).

Gnathosoma — **Subcapitulum** (370–395 (395) long (ventral); 285–300 (300) long (dorsal); 145–157.5 (157.5) tall) colorless, occasionally with faint reddish-purple coloration. Rostrum (155–165 (165) long; 50–55 (55) wide). Chelicerae (375–390 (390) long) with curved fangs (65–75 (75) long). Subcapitular proportions: ventral length/height 2.39–2.57 (2.51); rostrum length/width 2.91–3.20 (3.00). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (50–52.5 (50) long); femur (137.5–146.25 (145) long); genu (75–80 (80) long); tibia

Figure 44. Torrenticola daemon sp. n. distribution.

(97.5–105 (105) long; 22.5–25 (25) wide); tarsus (20–22.5 (20) long). Palpomere proportions: femur/genu 1.81–1.90 (1.81); tibia/femur 0.67–0.72 (0.72); tibia length/ width 4.05–4.33 (4.20).

Venter — (710–800 (800) long; 515–570 (545) wide) colorless. Gnathosomal bay (182.5–200 (190) long; 80–97.5 (97.5) wide). Cxgl-4 subapical. **Medial suture** (10–15 (15) long). **Genital plates** (160–175 (175) long; 145–150 (150) wide). Additional measurements: Cx-1 (310–345 (345) long (total); 125–155 (155) long (medial)); Cx-3 (350–375 (375) wide); anterior venter (155–185 (185) long). Ventral proportions: gnathosomal bay length/width 1.95–2.42 (1.95); anterior venter/genital field length 0.97–1.09 (1.06); anterior venter length/genital field width 1.07–1.23 (1.23); anterior venter/medial suture 10.33–17.50 (12.33).

MALE (Figure 46) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (545–570 (570) long; 410–425 (425) wide) circular with faint reddish-purple coloration separated into anterior and posterior portions. Anterio-medial platelets (115–125 (122.5) long; 52.5–58.75 (58.75) wide). Anterio-lateral platelets (175–188.75 (188.75) long; 67.5–75 (75) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 255–290 (275)). Dorsal plate proportions: dorsum length/width 1.31–1.34 (1.34); dorsal width/distance between Dgl-4 1.45–1.65 (1.55); anterio-medial platelet

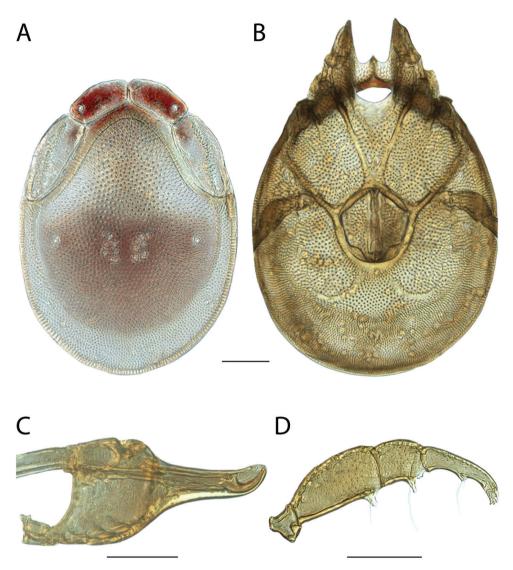

Figure 45. *Torrenticola daemon* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

length/width 2.09–2.22 (2.09); anterio-lateral platelet length/width 2.50–2.78 (2.52); anterio-lateral/anterio-medial length 1.40–1.63 (1.54).

Gnathosoma — **Subcapitulum** (320–335 (335) long (ventral); 247.5–255 (255) long (dorsal); 120–122.5 (120) tall) colorless, occasionally with faint reddish-purple coloration. Rostrum (132.5–137.5 (137.5) long; 40–45 (45) wide). Chelicerae (310–330 (330) long) with curved fangs (60–65 (60) long). Subcapitular proportions: ventral length/height 2.67–2.79 (2.79); rostrum length/width 3.06–3.31 (3.06). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–46.25 (45) long);

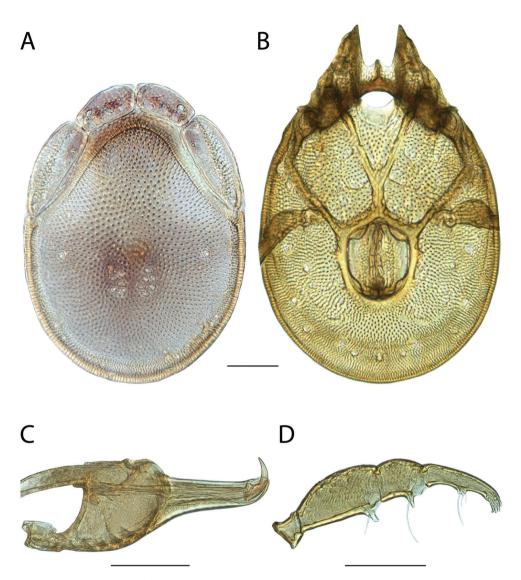

Figure 46. *Torrenticola daemon* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

femur (117.5–122.5 (120) long); genu (67.5–70 (67.5) long); tibia (90–92.5 (91.25) long; 21.25–22.5 (22.5) wide); tarsus (20–20 (20) long). Palpomere proportions: femur/genu 1.74–1.78 (1.78); tibia/femur 0.76–0.77 (0.76); tibia length/width 4.00–4.35 (4.06).

Venter — (655–705 (705) long; 460–470 (470) wide) colorless. Gnathosomal bay (165–165 (165) long; 70–80 (75) wide). Cxgl-4 subapical. **Medial suture** (50–55 (55) long). **Genital plates** (145–155 (155) long; 115–120 (120) wide). Additional measurements: Cx-1 (290–315 (290) long (total); 130–150 (130) long (medial)); Cx-3 (320–340 (340) wide); anterior venter (210–225 (225) long). Ventral proportions:

gnathosomal bay length/width 2.06–2.36 (2.20); anterior venter/genital field length 1.42–1.55 (1.45); anterior venter length/genital field width 1.75–1.91 (1.88); anterior venter/medial suture 4.00–4.20 (4.09).

IMMATURES unknown.

Etymology. Specific epithet (*daemon*) refers to the diagnostic red coloration on the anterio-medial platelets, which resemble the red eyes of an evil demon (*daemon*, L. originally benevolent or benign nature spirits, but were characterized as dangerous or evil by the writings of Plato and later used in Christian literature, popularizing the idea of demons as evil; noun in apposition).

Distribution. Alabama (Figure 44).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola daemon* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, elongate subcapitular rostra, elongate pedipalpal tibiae, and Dgl-4 close to the muscle scars, are consistent with placing this species in the Raptor Complex and Raptor Identification Group.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola danielleae are similar to other members of the Raptor Group (*T. daemon, T. elusiva, T. gnoma, T. irapalpa, T. ivyae, T. longitibia, T. mjolniri, T. racupalpa*, and *T. raptor*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. danielleae* can be differentiated from all other Raptor Group by having Dgl-4 closer to the edge of the dorsum (dorsum width/distance between Dgl-4 Q = 1.57-1.70 in *T. danielleae*, 1.80–3.29 in others; $\circ = 1.42-1.52$ in *T. danielleae*, 1.58–2.73 in others), except *T. daemon* (Q =1.59–1.67 $\circ = 1.45-1.65$). *T. danielleae* can be differentiated from *T. daemon* by having a more elongate rostrum (length/width = 3.43–3.75 in *T. danielleae*, 2.91–3.31 in *T. daemon*) and dorsal pattern.

Figure 47. Torrenticola danielleae sp. n. distribution.

Description. FEMALE (Figure 48) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (635–680 (635) long; 510–545 (510) wide) circular with reddishpurple coloration posteriorly extending in a strip anteriorly to the edge of the dorsal plate. Anterio-medial platelets (135–155 (147.5) long; 55–65 (62.5) wide). Anteriolateral platelets (170–195 (180) long; 70–80 (80) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 320–335 (320)). Dorsal plate proportions: dorsum length/width 1.20–1.30 (1.25); dorsal width/distance between Dgl-4 1.57–1.7 (1.59); anteriomedial platelet length/width 2.25–2.73 (2.36); anterio-lateral platelet length/width 2.25–2.79 (2.25); anterio-lateral/anterio-medial length 1.15–1.44 (1.22).

Gnathosoma — **Subcapitulum** (340–370 (365) long (ventral); 260–280 (270) long (dorsal); 135–145 (145) tall) colorless. Rostrum (150–160 (155) long; 40–45 (42.5) wide). Chelicerae (350–380 (380) long) with curved fangs (50–62.5 (62.5) long). Subcapitular proportions: ventral length/height 2.52–2.65 (2.52); rostrum length/width 3.44–3.75 (3.65). **Pedipalps** with long, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–45 (42.5) long); femur (127.5–141.25 (137.5) long); genu (67.5–75 (75) long); tibia (92.5–107.5 (102.5) long; 20–22.5 (21.25) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.77–1.89 (1.83); tibia/femur 0.73–0.76 (0.75); tibia length/width 4.63–5.00 (4.82).

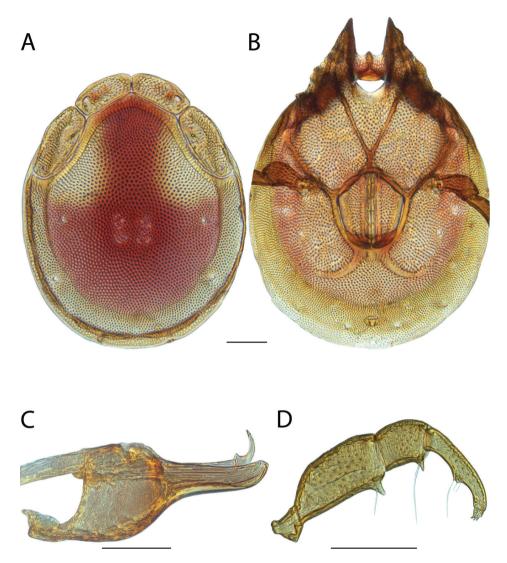

Figure 48. *Torrenticola danielleae* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Venter — (780–835 (780) long; 560–610 (560) wide) with reddish-purple coloration, occasionally faint. Gnathosomal bay (170–185 (185) long; 75–85 (80) wide). Cxgl-4 subapical. **Medial suture** (25–27.5 (27.5) long). **Genital plates** (165–185 (185) long; 155–160 (160) wide). Figure 49. *Torrenticola danielleae* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

MALE (Figure 49) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (490–530 (510) long; 370–385 (370) wide) circular with reddishpurple coloration posteriorly extending in a strip anteriorly to the edge of the dorsal plate. Anterio-medial platelets (115–125 (120) long; 45–52.5 (52.5) wide). Anteriolateral platelets (150–175 (150) long; 57.5–65 (65) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 250–265 (260)). Dorsal plate proportions: dorsum length/width 1.27–1.39 (1.38); dorsal width/distance between Dgl-4 1.42–1.52 (1.42); anteriomedial platelet length/width 2.29–2.72 (2.29); anterio-lateral platelet length/width 2.31–2.92 (2.31); anterio-lateral/anterio-medial length 1.25–1.43 (1.25).

Gnathosoma — **Subcapitulum** (285–295 (290) long (ventral); 210–220 (215) long (dorsal); 100–105 (105) tall) colorless. Rostrum (120–125 (120) long; 35–35 (35) wide). Chelicerae (270–300 (280) long) with curved fangs (40–50 (50) long). Subcapitular proportions: ventral length/height 2.74–2.85 (2.76); rostrum length/ width 3.43–3.57 (3.43). **Pedipalps** with long, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (33.75–37.5 (36.25) long); femur (100–110 (107.5) long); genu (60–62.5 (62.5) long); tibia (80–82.5 (82.5) long; 20–20 (20) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.67–1.79 (1.72); tibia/femur 0.74–0.83 (0.77); tibia length/width 4.00–4.13 (4.13).

Venter — (620–670 (650) long; 410–430 (420) wide) with reddish-purple coloration, occasionally faint. Gnathosomal bay (135–145 (142.5) long; 62.5–70 (67.5) wide). Cxgl-4 subapical. **Medial suture** (60–65 (60) long). **Genital plates** (132.5–145 (140) long; 102.5–107.5 (105) wide). Additional measurements: Cx-1 (260–280 (280) long (total); 125–135 (135) long (medial)); Cx-3 (290–310 (310) wide); anterior venter (205–220 (205) long). Ventral proportions: gnathosomal bay length/width 2.07–2.23 (2.11); anterior venter/genital field length 1.46–1.57 (1.46); anterior venter length/ genital field width 1.91–2.05 (1.95); anterior venter/medial suture 3.15–3.52 (3.42).

IMMATURES unknown.

Etymology. Specific epithet (*danielleae*) named in honor of Danielle Fisher—lab technician, environmental educator, colleague, friend, wife (of JRF), and mother of Ivy, our beautiful daughter—for her tireless and immense contributions to this research, and for bettering the lives of all those around her. Thank you, Danielle.

Distribution. Southern Appalachians, northeastern Georgia (Figure 47).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola danielleae* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, elongate subcapitular rostra, and elongate pedipalpal tibiae, are consistent with placing this species in the Raptor Complex and the Raptor Identification Group.

Torrenticola delicatexa Habeeb, 1955

T. amplexa delicatexa: Habeeb 1955: 4; 1957: 1. *T. delicatexa*: Habeeb 1961: 2; 1967: 3 • Viets 1987: 759.

Material examined. Type SERIES. HOLOTYPE (♂): from USA, New Jersey, Sussex County, Flatbrookeville, Flatbrook, 12 Oct 1953, by H Habeeb, HH530113.

PARATYPES (1 \bigcirc ; 0 \bigcirc): **New Jersey, USA**: 1 \bigcirc (ALLOTYPE) from Sussex County, Flatbrookeville, Flatbrook, 12 Oct 1953, by H Habeeb, HH530113.

OTHER MATERIAL (19 \bigcirc ; 7 \eth): North Carolina, USA: 1 \bigcirc from Haywood County, Great Smokey Mountains National Park, Cataloochee River (35°38'45"N, 83°4'34"W), 6 Sep 2009, by IM Smith, IMS090099 • Maine, USA: 1 \bigcirc and 1 \bigcirc from Franklin County, Small Falls picnic area beside Route 4, Sandy River (44°52'N, 70°31'W), 5 Jul 1989, by IM Smith, IMS890069 • New Hampshire, USA: $1 \ Q$ and 1 Å from Woodstock County, beside Route 118, Jackman Brook (44°0'N, 71°45'W), 11 Sep 1992, by IM Smith, IMS920036 • Pennsylvania, USA: 1 ♀ from Fayette County, Dunbar Creek (39°57'50"N, 79°35'8.70"W), 10 Aug 2014, by MJ Skvarla, MS 14-0810-001 • 2 ♀ and 2 ♂ from Fayette County, Ohiopyle State Park, Laurel Run (39°50'58"N, 79°30'51"W), 10 Aug 2014, by MJ Skvarla, MS 14-0810-005 • 2 ♀ from Somerset County, Laurel Hill State Park, Laurel Hill Creek (40°1'6"N, 79°14'4"W), 8 Aug 2014, by MJ Skvarla, MS 14-0808-001 • Quebec, Canada: 1 ♀ from Stanstead County, 1 kilometer south of Rock Island, Tomifobia River, Tompkin Stream, (45°0'31"N, 72°7'6"W), 20 Aug 1996, by IM Smith & M MacKenzie, IMS960056 • Tennessee, USA: 1 ♀ from Blount County, Great Smokey Mountains National Park, Abrams River (35°35'31"N, 83°51'21"W), 17 Sep 2010, by IM Smith, IMS100141 • 1 9 from Blount County, Great Smokey Mountains National Park, Little River (35°40'55"N, 83°39'6"W), 8 Sep 2009, by IM Smith, IMS090102 • 2 ♀ from Sevier County, Great Smokey Mountains National Park, middle prong of Little Pigeon River (35°43'34"N, 83°24'2"W), 10 Sep 2010, by IM Smith, IMS100127 • 1 ♀ from Sevier County, Great Smokey Mountains National Park, middle prong of Little Pigeon River (35°43'34"N, 83°24'2"W), 10 Sep 2010, by IM Smith, IMS100128 • 1 \bigcirc from Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail, spring (35°40'47"N, 83°31'52"W), 18 Sep 2010, by IM Smith, IMS100147 • **South Carolina, USA**: 1 \bigcirc from Greenville County, Matthews Creek, 24 Apr 2014, by D Eargle, JRF 14-0424-001 • **Vermont, USA**: 1 \bigcirc and 1 \bigcirc from Addison County, beside road from Lincoln, Middlebury River, (44°0'N, 73°1'W), 6 Jul 1989, by IM Smith, IMS890075 • **Virginia, USA**: 1 \bigcirc and 1 \bigcirc from Montgomery County, Blacksburg, beside Route 321 at Caldwell, Craig Creek (37°20'0"N, 80°20'0"W), 12 Jul 1990, by IM Smith, IMS900089A • 1 \bigcirc and 1 \bigcirc from Patrick County, Round Meadow Creek (36°42'59"N, 80°25'29"W), 10 Jun 2006, by IM Smith, IMS060005A.

Type deposition. Holotype (\bigcirc) and allotype (\bigcirc) deposited in CNC.

Diagnosis. Torrenticola delicatexa are similar to other members of Rusetria "Eastern 2-Plates" group (T. biscutella, T. caerulea, T. feminellai, T. indistincta, T. malarkeyorum, T. microbiscutella, T. pendula, T. sellersorum, T. tysoni, T. ululata, and T. whitneyae) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except T. indistincta and T. ululata), and being distributed in the east. T. delicatexa can be differentiated from T. ululata, T. indistincta, and T. feminellai by dorsal coloration and pattern. T. delicatexa can be differentiated from *T. tysoni* by having a stockier rostrum (length/width = 2.33–3.00 in *T.* delicatexa, 3.06–3.50 in A34). T. delicatexa can be differentiated from T. pendula by having a stockier gnathosomal bay (length/width = 1.28–2.22 in T. delicatexa, 2.42–2.90 in *T. pendula*), and a longer dorsum (Q = 560-620 in *T. delicatexa*, 630-650 in *T. pendula*; ♂ = 420–465 in *T. delicatexa*, 500 in *T. pendula*). *T. delicatexa* can be differentiated from T. microbiscutella by having a less elongate dorsum (length/width = 1.38-1.56 in T. delicatexa, 1.63-1.75 in T. microbiscutella). Female T. delicatexa can be differentiated from female T. malarkeyorum, T. biscutella, and T. caerulea by having a longer genital field (175–185 in T. delicatexa, 153–170 in others). Male T. delicatexa can be differentiated from male *T. biscutella* by having a more ovoid dorsum (length/width = 1.44-1.56 in T. delicatexa; 1.37–1.42 in T. biscutella). Female T. delicatexa can be differentiated from female *T. sellersorum* by having a slightly more ovoid dorsum (length/width = 1.38–1.44 in T. delicatexa, 1.23-1.37 in T. sellersorum). Male T. delicatexa do not have any measurement differences with male T. malarkeyorum, T. caerulea, and T. sellersorum; however, they can be differentiated by dorsal coloration. T. delicatexa can be differentiated from *T. whitneyae* by having a slightly more ovoid dorsum (length/width Q = 1.38-1.44 in *T. delicatexa*, 1.26–1.38 in *T. whitneyae*; $\mathcal{J} = 1.44–1.56$ in *T. delicatexa*, 1.35–1.37 in *T.* whitneyae) and by dorsal coloration. Additionally, male T. delicatexa can be differentiated from male *T. whitneyae* by having more elongate pedipalpal tibiae (length/width = 2.89-3.63 in T. delicatexa, 2.48-2.70 in T. whitneyae).

Re-description. MALE (Figure 51) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (410–465 (465) long; 270–320 (320) wide) ovoid with highly variable coloration, reddish-purple to purple (occasionally bluish-purple) separated into

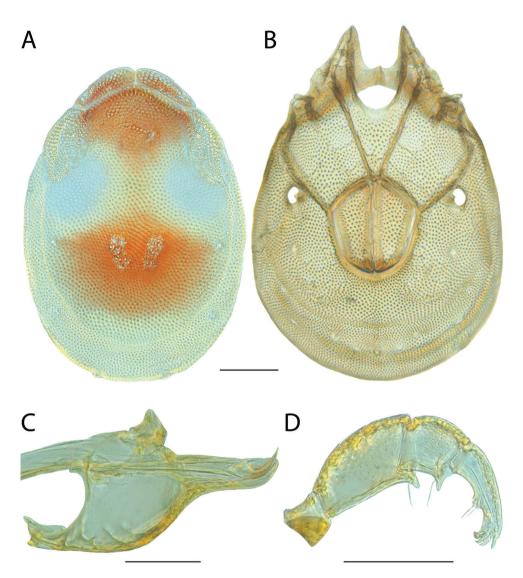

Figure 51. *Torrenticola delicatexa* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \ \mu m$.

anterior and posterior portions. Anterio-medial platelets (83.75–102.5 (102.5) long; 30–32.5 (32.5) wide). Anterio-lateral platelets (122.5–132.5 (132.5) long; 40–55 (52.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 205–255 (255)). Dorsal plate proportions: dorsum length/width 1.44–1.56 (1.45); dorsal width/distance between Dgl-4 1.23–1.37 (1.25); anterio-medial platelet length/width 2.79–3.17 (3.15); anterio-lateral platelet length/width 2.36–3.06 (2.52); anterio-lateral/anterio-medial length 1.29–1.46 (1.29).

Gnathosoma — **Subcapitulum** (235–247.5 (247.5) long (ventral); 172.5–193.75 (194) long (dorsal); 97.5–107.5 (107.5) tall) colorless. Rostrum (90–100 (100) long; 32.5–37.5 (37.5) wide). Chelicerae (220-230 long) with curved fangs (45–52.5 (50) long). Subcapitular proportions: ventral length/height 2.30–2.45 (2.30); rostrum length/width 2.67–2.81 (2.67). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (33.75–40 (40) long); femur (82.5–92.5 (92.5) long); genu (50–55 (55) long); tibia (62.5–72.5 (65) long; 20–22.5 (22.5) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.59–1.75 (1.68); tibia/femur 0.70–0.83 (0.70); tibia length/width 2.89–3.63 (2.89).

Venter — (490–540 (540) long; 311–435 (435) wide) usually colorless; occasionally with faint reddish-purple coloration. Gnathosomal bay (120–135 (135) long; 57.5–72.5 (72.5) wide). Cxgl-4 subapical. **Medial suture** (55–75 (62.5) long). **Genital plates** (105–110 (106.25) long; 95–102.5 (102.5) wide). Additional measurements: Cx-1 (220–235 (235) long (total); 78–100 (100) long (medial)); Cx-3 (240–297.5 (297.5) wide); anterior venter (160–175 (170) long). Ventral proportions: gnathosomal bay length/width 1.86–2.22 (1.86); anterior venter/genital field length 1.52–1.60 (1.60); anterior venter length/genital field width 1.64–1.79 (1.66); anterior venter/medial suture 2.33–2.91 (2.72).

FEMALE (Figure 52) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (560–620 (620) long; 390–440 (435) wide) ovoid with highly variable coloration, reddish-purple to purple (occasionally bluish-purple) separated into anterior and posterior portions. Anterio-medial platelets (125–140 (140) long; 36.25–45 (42.5) wide). Anterio-lateral platelets (152.5–172.5 (162.5) long; 57.5–70 (70) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 295–350 (330)). Dorsal plate proportions: dorsum length/ width 1.38–1.44 (1.43); dorsal width/distance between Dgl-4 1.26–1.33 (1.32); anterio-medial platelet length/width 2.83–3.52 (3.29); anterio-lateral platelet length/width 2.26–2.88 (2.32); anterio-lateral/anterio-medial length 1.16–1.33 (1.16).

Gnathosoma — **Subcapitulum** (305–345 (345) long (ventral); 216–260 (260) long (dorsal); 145–165 (160) tall) colorless. Rostrum (115–135 (135) long; 45–55 (45) wide). Chelicerae (312–350 (350) long) with curved fangs (54–75 (70) long). Subcapitular proportions: ventral length/height 1.97–2.22 (2.16); rostrum length/ width 2.33–3.00 (3.00). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–52.5 (47.5) long); femur (105–130 (128.75) long); genu (67.5–75 (72.5) long); tibia (81.25–90 (87.5) long; 22.5–30 (30) wide); tarsus (20–22.5 (22.5) long). Palpomere proportions: femur/genu 1.56–1.78 (1.78); tibia/femur 0.65–0.77 (0.68); tibia length/width 2.92–3.61 (2.92).

Venter — (640–690 (690) long; 431–540 (540) wide) usually colorless; occasionally with faint reddish-purple coloration. Gnathosomal bay (132.5–175 (157.5) long; 85–117.5 (117.5) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (175–197.5 (197.5) long; 150–172.5 (170) wide). Additional measurements: Cx-1 (216–295 (295) long (total); 93–135 (135) long (medial)); Cx-3 (304–400 (400)

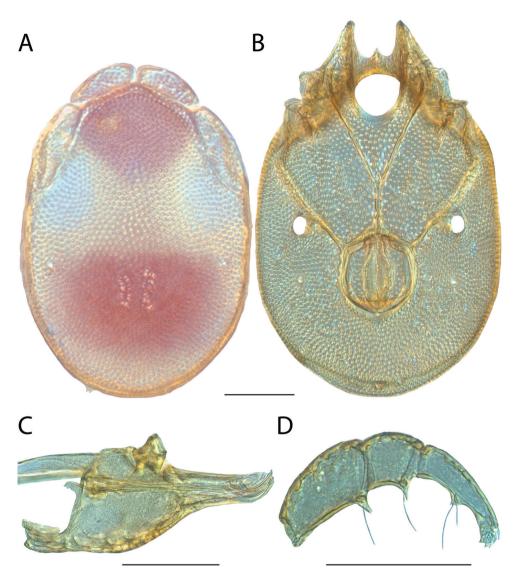

Figure 52. *Torrenticola delicatexa* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

wide); anterior venter (115–135 (135) long). Ventral proportions: gnathosomal bay length/width 1.28–2.06 (1.34); anterior venter/genital field length 0.64–0.76 (0.68); anterior venter length/genital field width 0.71–0.83 (0.79).

IMMATURES unknown.

Etymology. Habeeb (1955) did not offer an explanation for the specific epithet (*delicatexa*) and we are unable to offer helpful speculation.

Distribution. Appalachians (Figure 50).

Remarks. In all analyses, *Torrenticola delicatexa* groups with members of the Rusetria Complex with high support and specimens of this species were less than 2% different in COI sequence from each other. However, one specimen from Tennessee (DNA#1839) was 5% different; this specimen was collected from the same river as the other specimens and was indistinguishable morphologically. We refrain from speculating on this COI variation, but consider this specimen as an outlier, and thus within our hypothesis for *T. delicatexa*. The position of this species was only strongly supported in our combined analysis, where it is recovered as sister to two other species: *T. ululata* and *T. glomerabilis*. However, *T. delicatexa* does not resemble these species morphologically, and instead is quite similar to three more distantly-related species (*T. biscutella*, *T. malarkeyorum*, and *T. caerulea*).

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola dentirostra Fisher & Dowling, sp. n. http://zoobank.org/4D2ADBB1-C62F-4080-8E5E-3CA8F7BB626F

Material examined. HOLOTYPE (\bigcirc): from USA, Georgia, Chattooga County, beside road from Everett Springs to Villanow 1.4 km south of The Pocket Recreation Area, 4 July 1990, by IM Smith, IMS900077.

PARATYPES (4 \bigcirc ; 2 \circlearrowright): **Georgia, USA**: 1 \circlearrowright (ALLOTYPE) from Chattooga County, beside road from Everett Springs to Villanow 1.4 km south of The Pocket Recreation Area, 4 July 1990, by IM Smith, IMS900077 • 2 \bigcirc and 1 \circlearrowright from Chattooga County, beside road from Everett Springs to Villanow 1.4 km south of The Pocket Recreation Area, 4 July 1990, by IM Smith, IMS900077 • **Tennessee, USA**: 1 \bigcirc from Monroe County, beside Forest Route 35, 2.0 km northeast of road from Rt. 165 to Miller Chapel Baptist Church, (35°21'21"N, 84°9'9"W), 5 July 1990, by IM Smith, IMS900078 • **Virginia, USA**: 1 \bigcirc from Alleghany County, Covington; beside Rt. 18, 0.5 km north of Rt. 657, (37°44'44"N, 80°2'2"W), 13 July 1990, by IM Smith, IMS900091A.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(2 \bigcirc)$ deposited in the CNC; other paratypes $(2 \bigcirc; 1 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola dentirostra are similar to other members of the Nigroalba Group (*T. flangipalpa*, *T. nigroalba*, and *T. solisorta*) in being small, slightly elongate, and having purple dorsal coloration restricted posteriorly. *T. dentirostra* can be differentiated from most Torrenticola (except *T. erectirostra*, *T. karambita*, and *T. robisoni*) by having a dentate bump midway on the dorsal edge of the rostrum. *T. dentirostra* can be differentiated from *T. karambita*, *T. erectirostra*, and *T. robisoni* by having a straight rostrum (others have upturned rostra) and by dorsal pattern.

Description. FEMALE (Figure 54) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Figure 53. Torrenticola dentirostra sp. n. distribution.

Dorsum — (470–560 (470) long; 340–390 (340) wide) ovoid with faint purple coloration restricted posteriorly. Anterio-medial platelets (107.5–120 (107.5) long; 45–47.5 (45) wide). Anterio-lateral platelets (157.5–177.5 (157.5) long; 55–62.5 (55) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 240–275 (240)). Dorsal plate proportions: dorsum length/width 1.38–1.45 (1.38); dorsal width/distance between Dgl-4 1.38–1.43 (1.42); anterio-medial platelet length/width 2.32–2.67 (2.39); anterio-lateral platelet length/width 2.84–3.05 (2.86); anterio-lateral/anterio-medial length 1.43–1.59 (1.47).

Gnathosoma — **Subcapitulum** (275–330 (275) long (ventral); 200–247.5 (200) long (dorsal); 77.5–102.5 (77.5) tall) colorless. Rostrum (100–120 (100) long; 35–40 (35) wide) with dentate bump midway on dorsal edge. Chelicerae (255–320 (255) long) with curved fangs (45–55 (45) long). Subcapitular proportions: ventral length/ height 3.22-3.73 (3.55); rostrum length/width 2.80-3.00 (2.86). **Pedipalps** with tuberculate ventral extensions dentate apically on femora and genua. Palpomeres: trochanter (30–35 (30) long); femur (92.5–110 (92.5) long); genu (55–67.5 (55) long); tibia (80–92.5 (80) long; 17.5–20 (17.5) wide); tarsus (12.5–15 (13.75) long). Palpomere proportions: femur/genu 1.62-1.68 (1.68); tibia/femur 0.84–0.88 (0.86); tibia length/width 4.57-4.93 (4.57).

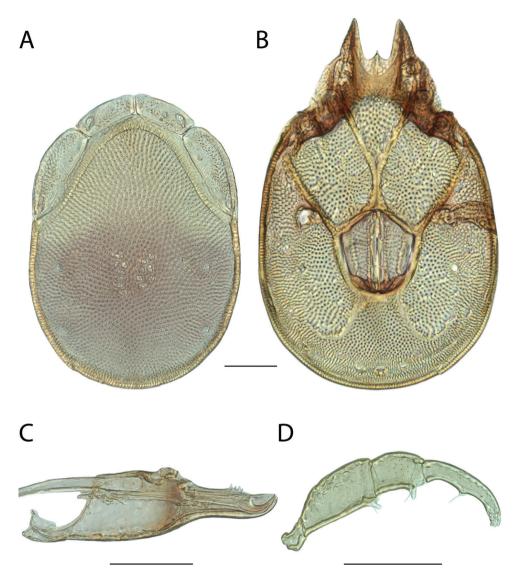

Figure 54. *Torrenticola dentirostra* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Venter — (610–685 (610) long; 390–425 (390) wide) mostly colorless with faint purple genital plates. Gnathosomal bay (85–110 (85) long; 60–80 (60) wide). Cxgl-4 far from apex and ventral. **Medial suture** (60–70 (60) long). **Genital plates** (142.5–165 (142.5) long; 120–135 (120) wide). Additional measurements: Cx-1 (230–260 (230) long (total); 140–160 (140) long (medial)); Cx-3 (270–300 (270) wide); anterior venter (210–240 (210) long). Ventral proportions: gnathosomal bay length/width 1.30–1.50

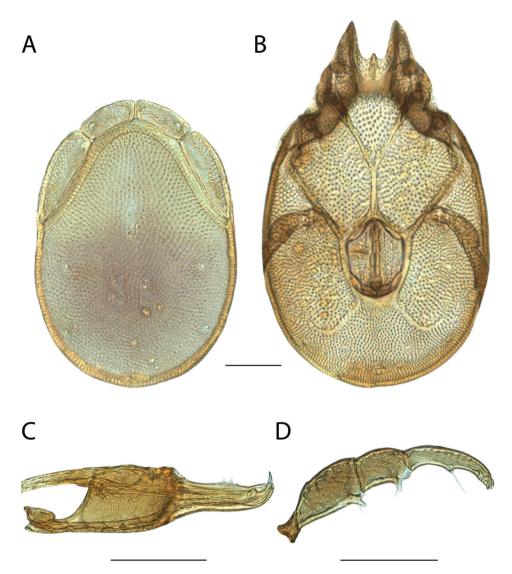

Figure 55. *Torrenticola dentirostra* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(1.42); anterior venter/genital field length 1.42–1.64 (1.47); anterior venter length/genital field width 1.70–1.83 (1.75); anterior venter/medial suture 3.29–3.69 (3.50).

MALE (Figure 55) (n = 2) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (480–505 (505) long; 360–360 (360) wide ovoid with faint purple coloration restricted posteriorly. Anterio-medial platelets (110–110 (110) long; 40–42.5 (42.5) wide). Anterio-lateral platelets (162.5–165 (165) long; 50–52.5 (52.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars

(distance between Dgl-4 240–245 (240)). Dorsal plate proportions: dorsum length/ width 1.33–1.40 (1.40); dorsal width/distance between Dgl-4 1.47–1.50 (1.50); anterio-medial platelet length/width 2.59–2.75 (2.59); anterio-lateral platelet length/ width 3.14–3.25 (3.14); anterio-lateral/anterio-medial length 1.48–1.50 (1.50).

Gnathosoma — **Subcapitulum** (285–287.5 (287.5) long (ventral); 210–217.5 (217.5) long (dorsal); 77.5–80 (77.5) tall) colorless. Rostrum (100–105 (100) long; 32.5–35 (32.5) wide) with dentate bump midway on dorsal edge. Chelicerae (255–265 (265) long) with curved fangs (40–45 (45) long). Subcapitular proportions: ventral length/height 3.56-3.71 (3.71); rostrum length/width 3.00-3.08 (3.08). **Pedipalps** with tuberculate ventral extensions dentate apically on femora and genua. Palpomeres: trochanter (30-32.5 (32.5) long); femur (90-92.5 (90) long); genu (57.5-57.5 (57.5) long); tibia (82.5-85 (85) long; 17.5-18.75 (18.75) wide); tarsus (12.5-13.75 (13.75) long). Palpomere proportions: femur/genu 1.57-1.61 (1.57); tibia/femur 0.89-0.94 (0.94); tibia length/width 4.53-4.71 (4.53).

Venter — (610–645 (645) long; 390–400 (400) wide) mostly colorless with faint purple genital plates. Gnathosomal bay (100–107.5 (407.5) long; 70–70 (70) wide). Cxgl-4 far from apex and ventral. **Medial suture** (75–85 (85) long). **Genital plates** (130–135 (135) long; 102.5–102.5 (102.5) wide). Additional measurements: Cx-1 (240–250 (250) long (total); 140–147.5 (147.5) long (medial)); Cx-3 (275–280 (275) wide); anterior venter (235–247.5 (247.5) long). Ventral proportions: gnathosomal bay length/width 1.43–1.54 (1.54); anterior venter/genital field length 1.81–1.83 (1.83); anterior venter length/genital field width 2.29–2.41 (2.41); anterior venter/medial suture 2.91–3.13 (2.91).

IMMATURES unknown.

Etymology. Specific epithet (*dentirostra*) refers to the diagnostic tooth-like serrations on the dorsal surface of the rostrum (*dentis*, L. tooth; *rostrum*, L. snout).

Distribution. Southern Appalachians (Figure 53).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola dentirostra* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, small size, elongate subcapitular rostra, elongate pedipalpal tibiae, and dorsal purple coloration restricted to posterior half, place this species in the Raptor Complex and the Nigroalba Identification Group.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(5 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(3 \heartsuit; 2 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola dimorpha are similar to other members of the Tricolor Complex (*T. bittikoferae, T. cardia, T. hoosieri, T. kringi, T. larvata, T. mohawk, T. pearsoni, T. olliei, T. sierrensis, T. tricolor, T. trimaculata, and T. unimaculata*) in having a short, conical rostrum. *T. dimorpha* can be differentiated from all other *Torrenticola* by having a dorsal plate with a medial extension covering nearly half the length of the anterio-medial platelets and by males having large, highly modified pedipalps, which are expanded vertically and laterally. Additionally, *T. dimorpha* can be differentiated from most other Tricolor Complex (except *T. bittikoferae*, T. *hoosieri*, and *T. pearsoni*) by being colorless, whereas most other members have bold patterning.

Description. FEMALE (Figure 57) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–670 (650) long; 455–520 (490) wide) colorless and ovoid. Anterior dorsal plate with medial extension covering nearly half the length of the anteriomedial platelets. Anterio-medial platelets (117.5–135 (135) long; 52.5–57.5 (57.5) wide). Anterio-lateral platelets (145–172.5 (172.5)) long; 55–65 (62.5) wide) free from dorsal plate. Dgl-4 approximately halfway in between the edge of the dorsum and the muscle scars (distance between Dgl-4 320–360 (360)). Dorsal plate proportions: dorsum length/width 1.29–1.33 (1.33); dorsal width/distance between Dgl-4 1.36–1.48 (1.36); anterio-medial platelet length/width 2.24–2.35 (2.35); anterio-lateral platelet length/width 2.46–2.78 (2.76); anterio-lateral/anterio-medial length 1.19–1.33 (1.28).

Gnathosoma — **Subcapitulum** (230–260 (255) long (ventral); 150–170 (170) long (dorsal); 110–132.5 (132.5) tall) colorless. Posterior dorsal apodeme long. Rostrum (65–70 (70) long; 42.5–50 (45) wide) very short. Chelicerae (210–245 (235) long) with curved fangs (60–70 (70) long). Subcapitular proportions: ventral length/ height 1.90–2.09 (1.92); rostrum length/width 1.40–1.56 (1.56). **Pedipalps** with long, tuberculate ventral extensions on femora and no ventral extensions on genua. Palpomeres: trochanter (37.5–40 (37.5) long); femur (76.25–85 (82.5) long); genu (52.5–62.5 (60) long); tibia (65–72.5 (70) long; 22.5–22.5 (22.5) wide); tarsus (20–22.5 (22.5) long). Palpomere proportions: femur/genu 1.36–1.48 (1.38); tibia/femur 0.84–0.87 (0.85); tibia length/width 2.89–3.22 (3.11).

Venter — (720–800 (770) long; 505–600 (580) wide) colorless. Gnathosomal bay (120–145 (145) long; 72.5–85 (85) wide). Cxgl-4 apical. **Medial suture** (25–30 (30)). **Genital plates** (170–195 (185) long; 162.5–180 (180) wide). Additional measurements: Cx-1 (240–270 (270) long (total); 110–130 (125) long (medial)); Cx-3 (315–350 (350) wide); anterior venter (137.5–155 (155) long). Ventral proportions: gnathosomal bay length/width 1.60–1.79 (1.71); anterior venter/genital field length 0.78–0.84 (0.84); anterior venter length/genital field width 0.85–0.86 (0.86).

MALE (Figure 58) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (465–510 (500) long; 310–330 (320) wide) colorless and ovoid. Anterior dorsal plate with medial extension covering nearly half the length of the anteriomedial platelets. Muscle scars absent or very faint. Anterio-medial platelets (102.5– 115 (107.5) long; 42.5–45 (45) wide). Anterio-lateral platelets (177.5–197.5 (195) long; 42.5–55 (55) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 225–245 (245)). Dorsal plate proportions: dorsum length/width 1.50–1.58 (1.56); dorsal width/distance between Dgl-4 1.31–1.41 (1.31); anterio-medial platelet length/width 2.34–2.63 (2.39);

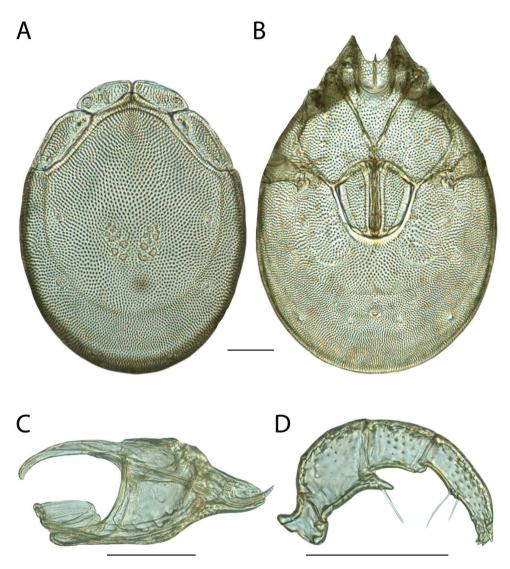

Figure 57. *Torrenticola dimorpha* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

anterio-lateral platelet length/width 3.38–4.65 (3.55); anterio-lateral/anterio-medial length 1.64–1.81 (1.81).

Gnathosoma — **Subcapitulum** (227.5–255 (240) long (ventral); 160–177.5 (165) long (dorsal); 100–110 (100) tall) colorless. Rostrum (45–50 (47.5) long; 32.5–37.5 (32.5) wide) very short. Chelicerae (195–235 (205) long) with curved fangs (55–65 (60) long). Subcapitular proportions: ventral length/height 2.17–2.40 (2.40); rostrum length/width 1.29–1.46 (1.46). **Pedipalps** highly modified and expanded, with long, tuberculate ventral extensions on femora and no ventral extensions on genua.

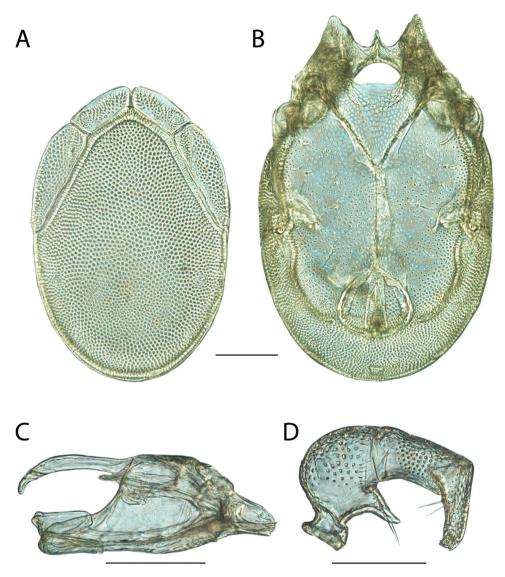

Figure 58. *Torrenticola dimorpha* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Palpomeres: trochanter (53.75–57.5 (55) long); femur (107.5–112.5 (112.5) long); genu (92.5–103.75 (103.75) long); tibia (77.5–85 (85) long; 30–35 (35) wide); tarsus (20–25 (22.5) long). Palpomere proportions: femur/genu 1.08–1.22 (1.08); tibia/femur 0.69–0.77 (0.76); tibia length/width 2.36–2.67 (2.43).

Venter — (550–620 (580) long; 350–370 (370) wide) colorless and highly modified with coxae II–IV forming a large ventral plate that covers the insertions of legs IV. Suture dividing coxae III and IV incomplete. Apodemes expanded internally. Gnathosomal bay (110–115 (112.5) long; 90–110 (90) wide) expanded to accommodate large pedipalps. Cxgl-4 apical. **Medial suture** (155–165 (155) long). **Genital plates** (100–120 (105) long; 105–110 (105) wide) triangular. Additional measurements: Cx-1 (230–260 (250) long (total); 130–145 (130) long (medial)); Cx-3 (335–345 (335) wide); anterior venter (297.5–315 (300) long). Ventral proportions: gnathosomal bay length/width 1.05–1.25 (1.25); anterior venter/genital field length 2.63–2.98 (2.86); anterior venter length/genital field width 2.70–2.86 (2.86); anterior venter/medial suture 1.88–2.03 (1.94).

IMMATURES unknown.

Etymology. Specific epithet (*dimorpha*) refers to the sexual dimorphism in terms of size and morphology (*di*, G. two; *morphé*, G. form), the resulting morphology is so unlike all other Torrenticolidae that upon first glance specimens appear to be a different family altogether.

Distribution. Texas (probably also extending southward into Mexico) (Figure 56). **Remarks.** *Torrenticola dimorpha* groups with other members of the Tricolor Complex with high support and specimens of this species were less than 1% different in COI sequence from each other. In the combined analysis, *T. dimorpha* groups with *T. larvata* and these species are greater than 16% different in COI sequence from each other. This clade (*T. dimorpha* + *T. larvata*) is sister to all other eastern members of the Tricolor Complex.

This species is so unique that upon initial observation, specimens appear to be members of a different genus, especially the males. However, the short conical rostrum that is downturned in males is characteristic of other members of the Tricolor Identification Group.

This species hypothesis is supported by biogeography, high divergence between species, and by highly distinctive morphological characteristics outlined in the diagnosis. The high degree of sexual size dimorphism (males are 15–30% smaller than females) is only matched by most members of the Rusetria Complex, where males are usually 20–30% smaller than females.

Torrenticola dolichodactyla Fisher & Dowling, sp. n. http://zoobank.org/38ADA75D-A5EA-42BC-8362-28666ADC8C69

Material examined. HOLOTYPE (♂): from USA, New Mexico, Catron County, Cottonwood Campground beside Rt. 180 south of Rt. 12, (33°37'37"N, 108°54'54"W), 12 July 1987, by IM Smith, IMS870086.

PARATYPES (0 ♀; 0 ♂):

Type deposition. Holotype (\mathcal{O}) deposited in the CNC.

Diagnosis. Torrenticola dolichodactyla are similar to other members of the Rala Group (*T. rala, T. lamellipalpis, T. boettgeri, T. kurtvietsi, T. keesdavidsi,* and *T. anoplopalpa*) by being colorless, having incomplete hind coxal margins and being distributed in the southwest. *T. dolichodactyla* can be differentiated from all other Rala Group by having longer pedipalpal tarsi (3° = 52.5 in *T. dolichodactyla*, 10–20 in others) and

Figure 59. Torrenticola dolichodactyla sp. n. distribution.

Dgl-4 closer to the muscle scars (dorsum width/distance between Dgl-4 \circ = 1.74 in *T. dolichodactyla*, 1.16–1.48 in others).

Description. FEMALE unknown.

MALE (Figure 60) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum — (735 long; 590 wide) circular and colorless. Anterio-medial platelets (177.5 long; 77.5 wide). Anterio-lateral platelets (227.5 long; 97.5 wide) free from dorsal plate. Dgl-4 halfway between the muscle scars and the edge of the dorsum (distance between Dgl-4 340). Dorsal plate proportions: dorsum length/width 1.25; dorsal width/distance between Dgl-4 1.74; anterio-medial platelet length/width 2.29; anterio-lateral platelet length/width 2.33; anterio-lateral/anterio-medial length 1.28.

Gnathosoma — **Subcapitulum** (325 long (ventral); 235 long (dorsal); 135 tall) colorless. Rostrum (120 long; 50 wide). Chelicerae (325 long) with curved fangs (65 long). Subcapitular proportions: ventral length/height 2.41; rostrum length/width 2.40. **Pedipalps** with elongate tarsi and tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (55 long); femur (140 long); genu (80 long); tibia (110 long; 32.5 wide); tarsus (52.5 long). Palpomere proportions: femur/genu 1.75; tibia/ femur 0.79; tibia length/width 3.38.

Venter — (850 long; 720 wide) colorless. Gnathosomal bay (170 long; 115 wide). Cxgl-4 apical. Medial suture (95 long). Genital plates (220 long; 170 wide). Ad-

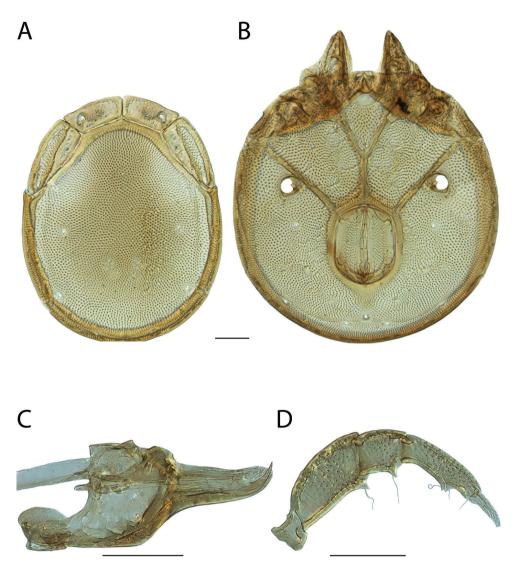

Figure 60. *Torrenticola dolichodactyla* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

ditional measurements: Cx-1 (350 long (total); 175 long (medial)); Cx-3 (480 wide); anterior venter (305 long). Ventral proportions: gnathosomal bay length/width 1.48; anterior venter/genital field length 1.39; anterior venter length/genital field width 1.79; anterior venter/medial suture 3.21.

IMMATURES unknown.

Etymology. Specific epithet (*dolichodactyla*) refers to elongate pedipalp tarsus (*dolichos*, G. long; *daktylos*, G. finger), which is the most elongate of all Torrenticolidae. **Distribution.** New Mexico (probably also Arizona) (Figure 59).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola dolichodactyla* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, incomplete hind coxal margins, distribution, and lack of color are consistent with placing this species in the Rala Identification Group.

Torrenticola dunni Fisher & Dowling, sp. n. http://zoobank.org/333688CE-B5DB-4930-B13D-FCFF639E54A7

Diagnosis. *Torrenticola dunni* are similar to other members of the Rusetria "4-Plates" group (*T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba* and *T. shubini*) and *T. skvarlai* in having anterio-lateral platelets free from the dorsal plate, dorsal coloration separated into anterior and posterior portions, and indistinct hind coxal margins. *T. dunni* can be differentiated from *T. pollani* by having a larger dorsum (length Q = 605-680 in *T. dunni*, 535–560 in *T. pollani*; $\Diamond = 500-540$ in *T. dunni*, 440–492 in *T. pollani*; width Q = 440-490 in *T. dunni*, 410–420 in *T. pollani*; $\Diamond = 350-370$ in *T. dunni*, 310–340 in *T. pollani*); and a stockier rostrum (length/width = 2.80–3.14 in *T. dunni*, 3.27–3.82 in *T. pollani*). Female *T. dunni* can be differentiated from female *T. shubini* by having a thinner rostrum (length/width = 2.8–3.0 in *T. dunni*, 2.5–2.7 in *T. shubini*). Male *T. dunni* can be differentiated from male *T. shubini*). *T. dunni* can be differentiated from the differentiated from male *T. shubini* by having a longer anterior venter (277–285 in *T. dunni*, 215–238 in *T. shubini*). *T. dunni* can be differentiated from the differen

Figure 61. Torrenticola dunni sp. n. distribution.

entiated from T. glomerabilis by having Dgl-4 closer to the dorsal edge (dorsal width/ distance between Dgl-4 = 1.2-1.4 in T. dunni, 1.5-1.7 in T. glomerabilis) and stockier tibiae (length/width \mathcal{Q} = 3.27–3.50 in *T. dunni*, 4.11–4.50 in *T. glomerabilis*, \mathcal{J} = 3.25– 3.44 in T. dunni, 3.55-4.38 in T. glomerabilis). Female T. dunni can be differentiated from female T. kittatinniana by having a longer pedipalp genu (70–75 in T. dunni, 64 in *T. kittatinniana*); a longer subcapitulum (ventral length = 330–355 in *T. dunni*, 310 in *T. kittatinniana*); and anterio-medial platelets more elongate (length/width = 2.33–2.54 in T. dunni, 2.83 in T. kittatinniana). Male T. dunni can be differentiated from male T. kittatinniana by having a longer anterior venter (277-285 in T. dunni, 235 in T. kittatinniana) and wider dorsum (350-370 in T. dunni, 340 in T. kittatinniana). T. dunni can be differentiated from *T. rufoalba* by having a larger dorsum (length Q = 605-680in *T. dunni*, 550 in *T. rufoalba*; $\mathcal{J} = 500-540$ in *T. dunni*, 440 in *T. rufoalba*; width $\mathcal{Q} =$ 440–490 in *T. dunni*, 400 in *T. rufoalba*; ♂ = 350–370 in *T. dunni*; 320 in *T. rufoalba*). T. dunni can be differentiated from T. skvarlai by having a conical pedipalpal femoral tubercle, whereas T. skvarlai has a broad and flat pedipalpal femoral tubercle, and by having a longer anterior venter (Q = 160-190 in *T. dunni*, 140–152.5 in *T. skvarlai*; \bigcirc = 277.5–285 in T. dunni, 177.5–205 in T. skvarlai).

Description. FEMALE (Figure 62) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (605–680 (655) long; 440–490 (460) wide) ovoid with purple or reddish-purple coloration separated into anterior and posterior portions, and occasionally

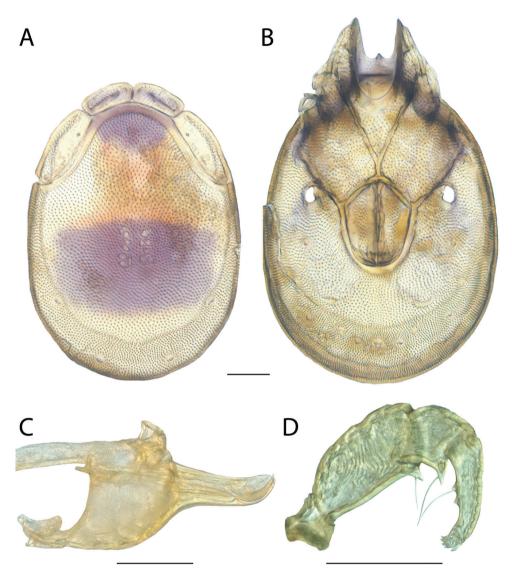

Figure 62. *Torrenticola dunni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

with faint orange medially. Anterio-medial platelets (117.5–125 (125) long; 46.25–52.5 (50) wide). Anterio-lateral platelets (172.5–197.5 (192.5) long; 62.5–68.75 (62.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 315–380 (340)). Dorsal plate proportions: dorsum length/width 1.37–1.42 (1.42); dorsal width/distance between Dgl-4 1.29–1.40 (1.35); anterio-medial platelet length/width 2.33–2.54 (2.50); anterio-lateral platelet length/width 2.76–3.08 (3.08); anterio-lateral/anterio-medial length 1.44–1.61 (1.54).

Gnathosoma — **Subcapitulum** (330–355 (345) long (ventral); 250–265 (255) long (dorsal); 132.5–150 (150) tall) colorless. Rostrum (130–140 (135) long; 45–50 (45) wide). Chelicerae (325–355 (350) long) with curved fangs (60–65 (60) long). Subcapitular proportions: ventral length/height 2.30–2.53 (2.30); rostrum length/ width 2.80–3.00 (3.00). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–50 (48.75) long); femur (117.5–132.5 (131.25) long); genu (70–75 (75) long); tibia (85–95 (90) long; 25–27.5 (27.5) wide); tarsus (20–20 (20) long). Palpomere proportions: femur/genu 1.68–1.83 (1.75); tibia/femur 0.69–0.72 (0.69); tibia length/width 3.27–3.50 (3.27).

Venter — (710–810 (780) long; 540–600 (600) wide) with faint bluish-purple or reddish purple coloration or colorless. Gnathosomal bay (157.5–175 (175) long; 92.5–115 (115) wide). Cxgl-4 subapical. **Medial suture** (20–25 (20) long). **Genital plates** (160–185 (177.5) long; 145–160 (152.5) wide). Additional measurements: Cx-1 (290–330 (330) long (total); 140–160 (155) long (medial)); Cx-3 (365–410 (400) wide); anterior venter (160–190 (190) long). Ventral proportions: gnathosomal bay length/width 1.50–1.70 (1.52); anterior venter/genital field length 0.99–1.07 (1.07); anterior venter length/genital field width 1.08–1.25 (1.25); anterior venter/medial suture 7.60–9.50 (9.50).

MALE (Figure 63) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (500–540 (540) long; 350–370 (360) wide) ovoid with purple or reddish-purple coloration separated into anterior and posterior portions, and occasionally with faint orange medially. Anterio-medial platelets (95–102.5 (100) long; 37.5–42.5 (41.25) wide). Anterio-lateral platelets (165–172.5 (172.5) long; 55–60 (55) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 265–295 (285)). Dorsal plate proportions: dorsum length/ width 1.35–1.53 (1.50); dorsal width/distance between Dgl-4 1.24–1.32 (1.26); anterio-medial platelet length/width 2.41–2.56 (2.42); anterio-lateral platelet length/width 2.88–3.14 (3.14); anterio-lateral/anterio-medial length 1.66–1.74 (1.73).

Gnathosoma — **Subcapitulum** (275–285 (285) long (ventral); 205–215 (215) long (dorsal); 102.5–115 (105) tall) colorless. Rostrum (105–112.5 (110) long; 35–38.75 (35) wide). Chelicerae (265–280 (275) long) with curved fangs (50–55 (52.5) long). Subcapitular proportions: ventral length/height 2.43–2.71 (2.71); rostrum length/width 2.90–3.14 (3.14). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–47.5 (40) long); femur (105–107.5 (107.5) long); genu (62.5–66.25 (65) long); tibia 77.5–85 (77.5) long; 22.5–25 (22.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.58–1.72 (1.65); tibia/femur 0.72–0.79 (0.72); tibia length/width 3.25–3.44 (3.44).

Venter — (640–660 (655) long; 440–470 (460) wide) with faint bluish-purple or reddish purple coloration or colorless. Gnathosomal bay (125–135 (130) long; 75–82.5 (82.5) wide). Cxgl-4 subapical. **Medial suture** (120–135 (125) long). **Genital plates** (130–137.5 (135) long; 85–90 (87.5) wide). Additional measurements: Cx-1 (260–275 (275) long (total); 135–145 (145) long (medial)); Cx-3 (330–350 (335)

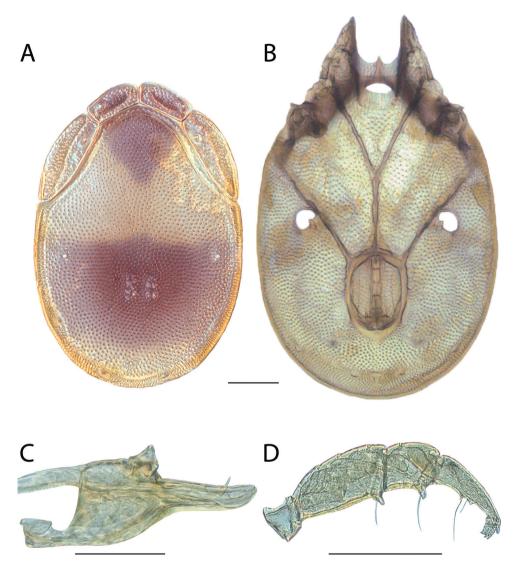

Figure 63. *Torrenticola dunni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

wide); anterior venter (277.5–285 (285) long). Ventral proportions: gnathosomal bay length/width 1.56–1.80 (1.58); anterior venter/genital field length 2.04–2.19 (2.11); anterior venter length/genital field width 3.11–3.35 (3.26); anterior venter/medial suture 2.06–2.33 (2.28).

IMMATURES unknown.

Etymology. Specific epithet (*dunni*) named in honor of Rob Dunn of North Carolina State University, for his exceptional writings and research that personalize ecology by

bringing nature indoors; and particularly for his storytelling ability, in which he wonderfully conveys that we humans, rather than being separate from nature, are indeed just as wild as what we perceive outdoors—a sentiment exemplified by his book, *Wild Life of Our Bodies: Predators, Parasites, and Partners That Shape Who We Are Today* (2011).

Distribution. Southeastern Appalachians (Figure 61).

Remarks. In all analyses, *Torrenticola dunni* groups with two other members of the Rusetria Complex with high support and specimens are less than 1% different in COI sequence from each other. In all analyses, *T. dunni* groups with two other species: *T. pollani* and *T. shubini*. These species are greater than 5% different from each other in COI sequence and the ranges of *T. T. dunni* overlaps with *T. shubini*, but the ranges of these species do not overlap with *T. pollani*. Given our collection efforts across the Appalachians, it is reasonable to speculate that *T. dunni* is restricted to the southern Appalachians.

Based upon overall similarity, dorso-lateral platelet fusion, and distribution, we were able to place this species within the Eastern 2-Plate Identification Group

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Type deposition. Holotype $(\stackrel{\bigcirc}{\downarrow})$ and paratype $(1 \stackrel{\bigcirc}{\downarrow})$ deposited in the CNC.

Diagnosis. *Torrenticola ellipsoidalis* are similar to other members of the Ellipsoidalis Group (*T. multiforma, T. occidentalis*, and *T. leviathan*), in being among the largest *Torrenticola* in the west (dorsum length $\Im = 700-885$; $\Im = 665-850$), although *T. sierrensis* are also large (dorsum length $\Im = 700-880$; $\Im = 590-735$) but can easily be distinguished from the Ellipsoidalis Group by being circular instead of ellipsoid or rectangular (dorsum length/width = 1.17–1.28 in *T. sierrensis*, 1.30–1.67 in Ellipsoidalis Group). *T. ellipsoidalis* can be differentiated from *T. multiforma* by having stockier subcapitular rostra (length/width = 1.8–2.1 in *T. ellipsoidalis*, 2.5–2.8 in *T. multiforma*). *T. ellipsoidalis* can be differentiated from *T. occidentalis* (only known from females) by having a longer medial suture (40–57.5 in *T. ellipsoidalis*, 20 in *T. occidentalis*) and by having stockier anterio-lateral platelets (length/width = 2.00–2.39 in *T. ellipsoidalis*, 2.54 in *T. occidentalis*). *T. ellipsoidalis* can be differentiated from *T. leviathan* by having less elongate pedipalpal tibiae (length/width = 2.6–3.3 in *T. ellipsoidalis*, 3.4–4.2 in *T. leviathan*) and stockier anterio-medial platelets (length/width $\Im = 1.43-1.72$ in *T. ellipsoidalis*, 1.94–2.14 in *T. leviathan*; $\Im = 1.53-2.00$ in *T. ellipsoidalis*, 2.15 in *T. leviathan*).

Re-description. FEMALE (Figure 65) (n = 8) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (765–885 (800) long; 520–605 (540) wide) rectangular and usually colorless, occasionally with faint purple coloration without distinct pattern. Anteriomedial platelets (127.5–147.5 137.5) long; 80–97.5 (80) wide). Anterio-lateral platelets (207.5–235 (217.5) long; 90–115 (92.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 390–470 (410)). Dorsal plate proportions: dorsum length/width 1.41–1.64 (1.48); dorsal width/distance between Dgl-4 1.27–1.40 (1.32); anterio-medial platelet length/ width 1.43–1.72 (1.72); anterio-lateral platelet length/width 2.00–2.39 (2.35); anterio-lateral/anterio-medial length 1.48–1.77 (1.58).

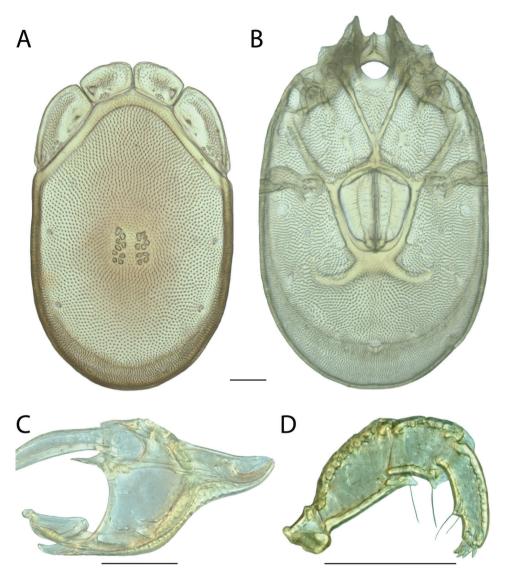

Figure 65. *Torrenticola ellipsoidalis* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Gnathosoma — **Subcapitulum** (285–315 (310) long (ventral); 194–219 (215) long (dorsal); 145–165 (165) tall) colorless. Rostrum (115–127.5 (117.5) long; 57.5–62.5 (60) wide) short and conical. Chelicerae (261–289 long) with curved fangs (61–74 long). Subcapitular proportions: ventral length/height 1.82–2.07 (1.88); rostrum length/width 1.84–2.09 (1.96). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (40) long); femur (101.25–107.5 (102.5) long); genu (70–77.5 (77.5) long); tibia (80–90 (85) long; 26.25–27.5 (27.5)

wide); tarsus (17.5–21.25 (20) long). Palpomere proportions: femur/genu 1.32–1.46 (1.32); tibia/femur 0.76–0.85 (0.83); tibia length/width 2.91–3.27 (3.09).

Venter — (885–1000 (935) long; 605–700 (605) wide) colorless. Gnathosomal bay (157.5–180 (177.5) long; 80–105 (85) wide). Cxgl-4 subapical. **Medial suture** (40–57.5 (47.5) long). **Genital plates** (201.25–222.5 (205) long; 167.5–195 (172.5) wide). Additional measurements: Cx-1 (308–337.5 (335) long (total); 122–162.5 (162.5) long (medial)); Cx-3 (393–440 (405) wide); anterior venter (210–237.5 (225) long). Ventral proportions: gnathosomal bay length/width 1.50–2.12 (2.09); anterior venter/genital field length 1.01–1.13 (1.10); anterior venter length/genital field width 1.13–1.30 (1.30); anterior venter/medial suture 3.83–5.94 (4.74).

MALE (Figure 66) (n = 6) with characters of the genus with following specifications.

Dorsum — (725–850 long; 450–565 wide) rectangular and usually colorless, occasionally with faint purple coloration without distinct pattern. Anterio-medial platelets (122.5–165 long; 72.5–95 wide). Anterio-lateral platelets (195–230 long; 85–107.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 350–460). Dorsal plate proportions: dorsum length/width 1.38–1.67; dorsal width/distance between Dgl-4 1.22–1.43; anterio-medial platelet length/width 1.53–2.00; anterio-lateral platelet length/width 2.07–2.36; anterio-lateral/anterio-medial length 1.39–1.67.

Gnathosoma — **Subcapitulum** (280–290 long (ventral); 196–203.75 long (dorsal); 138.75–155 tall) colorless. Rostrum (102.5–115 long; 52.5–60 wide) short and conical. Chelicerae (263–280 long) with curved fangs (60–74 long). Subcapitular proportions: ventral length/height 1.87–2.04; rostrum length/width 1.86–2.02. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–41.25 long); femur 92.5–100 long); genu (65–72.5 long); tibia (72.5–80 long; 25–30 wide); tarsus (17.5–20 long). Palpomere proportions: femur/genu 1.31–1.46; tibia/femur 0.74–0.84; tibia length/width 2.64–3.1.

Venter — (840–980 long; 469–653 wide) colorless. Gnathosomal bay (147.5–177.5 long; 77.5–90 wide). Cxgl-4 subapical. **Medial suture** (70–90 long). **Genital plates** (177.5–236.25 long; 131.25–162.5 wide). Additional measurements: Cx-1 (283–345 long (total); 117–167.5 long (medial)); Cx-3 (348–432.5 wide); anterior venter (245–270 long). Ventral proportions: gnathosomal bay length/width 1.69–2.15; anterior venter/genital field length 1.14–1.44; anterior venter length/genital field width 1.66–1.96; anterior venter/medial suture 2.72–3.71.

IMMATURES unknown.

Etymology. Marshall (1943) presumably named the specific epithet (*ellipsoidalis*) after the elongate body of this species, as she wrote, "the body is an ellipse."

Distribution. Western (Figure 64). *T. ellipsoidalis* was previously recorded from Martis Creek and Gibbon River, Wyoming (Marshall 1943); and from Torch River, Saskatchewan (Quaglia & Conroy 1984). We expand the range into most of western North America. However, *T. ellipsoidalis* is not known from the southwest.

Remarks. Torrenticola ellipsoidalis groups other members of the Miniforma Complex with high support and most specimens are 0-3% different in COI se-

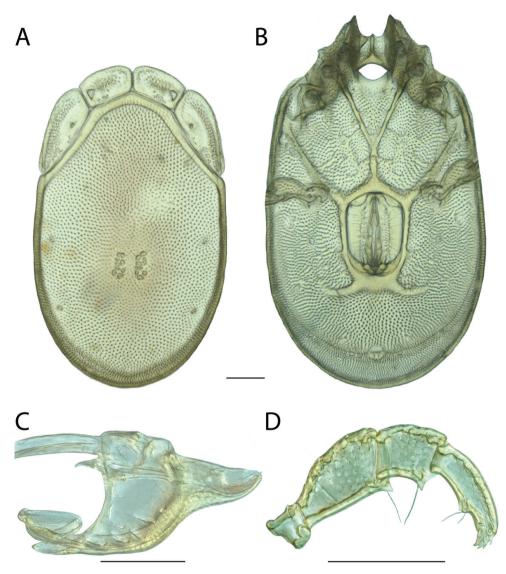

Figure 66. *Torrenticola ellipsoidalis* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

quence. This is higher sequence variability than in many species hypotheses presented herein. However, given the topology in the COI tree (Figure 10, 16) and morphological similarity, it seems apparent that the variability represents a continuum across a large distribution, rather than isolated species. An exception is that a single specimen (DNA#1930) is 2.9-3.6% different from the rest. This specimen is indistinguishable from other specimens and is collected from the same location. We do not find evidence to propose it as a separate species and therefore include it within *T. ellipsoidalis*. In all analyses, *T. ellipsoidalis* groups with *T. multiforma* and *T. regalis*, which are greater than 10% different from each other. Based upon overall similarity, body size, and distribution, we place this species within the Ellipsoidalis Identification Group.

Upon examining the types of *T. ellipsoidalis* and *T. rectiforma*, all characters for both species overlap with members of only one clade in our analyses. Furthermore, the main character Habeeb (1974) used to differentiate *T. rectiforma* from *T. ellipsoidalis* was body size, which is known to be a highly variable character. Therefore, we synonymize *T. rectiforma* as the junior synonym of *T. ellipsoidalis*.

Torrenticola elongata Fisher & Dowling, sp. n. http://zoobank.org/85ABDA54-25DD-44C9-B075-C344261B7347

Material examined. HOLOTYPE (\bigcirc): from USA, Mississippi, Tishomingo County, Tishomingo State Park, Rock Quarry Branch (34°36'N, 88°11'W), 18 Sep 1991, by IM Smith, IMS910049.

PARATYPES (1 \bigcirc ; 2 \eth): **Mississippi, USA**: 1 \circlearrowright (ALLOTYPE) from Tishomingo County, Tishomingo State Park, Rock Quarry Branch (34°36'43"N, 88°12'4"W), 20 Sep 2009, by IM Smith, IMS090115, DNA 1593 • 1 \bigcirc and 1 \circlearrowright from Tishomingo County, Tishomingo State Park, Rock Quarry Branch (34°36'43"N, 88°12'4"W), 20 Sep 2009, by IM Smith, IMS090115.

Type deposition. Holotype (\bigcirc), allotype (\eth) deposited in the CNC; other paratypes (1 \bigcirc ; 1 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola elongata are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (*T. dunni*, *T. glomerabilis*, *T. kittatinniana*, *T. pollani*, *T. rufoalba* and *T. shubini*), Neoanomala Group (*T. interiorensis* and *T. neoanomala*), and *T. bondi*, *T. erectirostra*, *T. robisoni*, *T. gorti*, *T. reduncarostra*, *T. irapalpa*, *T. racupalpa*, *T. skvarlai*, and *T. arktonyx*. *T. elongata* can be differentiated from all other *Torrenticola* with similar dorsal patterning by having a more elongate dorsum (length/width Q = 1.92-2.08 in *T. elongata*, 1.17–1.58 in others; $\mathcal{J} = 1.70-1.70$ in *T. elongata*, 1.20–1.68 in others). Additionally, they can be differentiated from Rusetria 4-Plates and *T. skvarlai* by having distinct hind coxal margins, they can be differentiated from *T. erectirostra* and *T. robisoni* by having a straight, anteriorly-directed rostrum (upturned in others), and they can be differentiated from *T. arktonyx* by having an unmodified dorsal plate (*T. arktonyx* has distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly).

Description. FEMALE (Figure 68) (n = 2) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–565 (540) long; 260–295 (260) wide) ovoid and elongate with purple coloration separated into anterior and posterior portions. Anterio-medial platelets (105–105 (105) long; 47.5–50 (47.5) wide). Anterio-lateral platelets (150–157.5 (150) long; 42.5–45 (45) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 180–200 (180)). Dorsal

Figure 67. Torrenticola elongata sp. n. distribution.

plate proportions: dorsum length/width 1.92–2.08 (1.92); dorsal width/distance between Dgl-4 1.44–1.48 (1.48); anterio-medial platelet length/width 2.10–2.21 (2.21); anterio-lateral platelet length/width 3.33–3.71 (3.33); anterio-lateral/anterio-medial length 1.43–1.50 (1.43).

Gnathosoma — **Subcapitulum** (285–295 (285) long (ventral); 210–222 (210) long (dorsal); 101.25–102.5 (101.25) tall) colorless. Rostrum (115–117.5 (117.5) long; 32.5–36.25 (32.5) wide) elongate. Chelicerae ((290) long) with curved fangs (45–47.5 (45) long). Subcapitular proportions: ventral length/height 2.81–2.88 (2.81); rostrum length/width 3.24–3.54 (3.24). **Pedipalps** with tuberculate ventral extensions on femora and on genua. Palpomeres: trochanter (35–37.5 (37.5) long); femur (96.25–100 (96.25) long); genu (55–57.5 (55) long); tibia (61.25–62.5 (61.25) long; 20–21.25 (20) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.74–1.75 (1.75); tibia/femur 0.63–0.64 (0.64); tibia length/width 2.94–3.06 (3.06).

Venter — (690–690 (690) long; 300–350 (300) wide) colorless. Gnathosomal bay (130–135 (130) long; 56.25–60 (56.25) wide). Cxgl-4 subapical. **Medial suture** (52.5–60 (60) long). **Genital plates** (142.5–145 (142.5) long; 120–122.5 (120) wide). Additional measurements: Cx-1 (250–270 (250) long (total); 120–125 (120) long (medial)); Cx-3 (240–258 (240) wide); anterior venter (205–207.5 (205) long). Ventral proportions: gnathosomal bay length/width 2.25–2.31 (2.31); anterior venter/

long; 43.75–45 (43.75) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 175–180 (180)). Dorsal plate proportions: dorsum length/width 1.70–1.70 (1.70); dorsal width/distance between Dgl-4 1.50–1.51 (1.50); anterio-medial platelet length/width 1.95–2.22 (2.22); anterio-lateral platelet length/width 2.97–3.17 (2.97); anterio-lateral/anterio-medial length 1.30–1.54 (1.30).

Gnathosoma — Subcapitulum (250–255 (255) long (ventral); 184–187 (184) long (dorsal); 85–87.5 (85) tall) colorless. Rostrum (97.5–102.5 (102.5) long; 30–

30 (30) wide) elongate. Chelicerae (243–262 (243) long) with curved fangs (34–42 (42) long). Subcapitular proportions: ventral length/height 2.83–3.00 (3.00); rostrum length/width 3.25-3.42 (3.42). **Pedipalps** with tuberculate ventral extensions on femora and on genua. Palpomeres: trochanter (31.25–37.5 (31.25) long); femur (83.75–85 (83.75) long); genu (47.5–47.5 (47.5) long); tibia (57.5–60 (57.5) long; 18.75–20 (20) wide); tarsus (15–15 (15) long). Palpomere proportions: femur/genu 1.76–1.79 (1.76); tibia/femur 0.69–0.71 (0.69); tibia length/width 2.88–3.20 (2.88).

Venter — (565–570 (570) long; 325–329 (329) wide) colorless. Gnathosomal bay (105–110 (105) long; 50–55 (55) wide). Cxgl-4 subapical. **Medial suture** (55–80 (55) long). **Genital plates** (107.5–113.75 (113.75) long; 92.5–92.5 (92.5) wide). Additional measurements: Cx-1 (207–232 (231) long (total); 82–98 (98) long (medial)); Cx-3 (257–266 (266) wide); anterior venter (215–220 (215) long). Ventral proportions: gnathosomal bay length/width 1.91–2.20 (1.91); anterior venter/genital field length 1.89–2.05 (1.89); anterior venter length/genital field width 2.32–2.38 (2.32); anterior venter/medial suture 2.75–3.91 (3.91).

IMMATURES unknown.

Etymology. Specific epithet (*elongata*) refers to elongated bodies of this species, which is more pronounced than in all other North American *Torrenticola* (*elongatus*, L. prolonged).

Distribution. Known only from Tishomingo County, Mississippi (Figure 67).

Remarks. Torrenticola elongata groups with other members of the Raptor Complex with high support and specimens are less than 1% different in COI sequence from each other. In all analyses, *T. elongata* groups with two other species (*T. gorti* and *T. bondi*) which are 4% different from each other and have non-overlapping ranges.

Based upon overall similarity, an elongate body, and distribution, we place this species in the Elongata Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola elusiva Fisher & Dowling, sp. n. http://zoobank.org/74B322FC-CA98-4BE9-AA6C-B819FD821C93

Material examined. HOLOTYPE (\bigcirc): from Canada, New Brunswick, Charlotte County, Rollingham, Whittier Ridge, Highway 770, 6.6 km east of covered bridge, 3 Oct 2011, by IM Smith, IMS110120, DNA 1857.

Type deposition. Holotype (\bigcirc) deposited in the CNC.

Diagnosis. Torrenticola elusiva are similar to other members of the Raptor Group (*T. gnoma, T. irapalpa, T. longitibia, T. mjolniri, T. racupalpa, T. raptor, T. danielleae, T. daemon,* and *T. ivyae*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. elusiva* can be differentiated from *T. racupalpa* by having a stockier subcapitulum (ventral length/height =

Figure 70. Torrenticola elusiva sp. n. distribution.

2.39 in T. elusiva, 2.48–2.73 in T. racupalpa); and by dorsal pattern. T. elusiva can be differentiated from T. irapalpa and T. daemon by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.5 in T. elusiva, 1.59-2.09 in others); a more elongate rostrum (length/width = 3.65 in T. elusiva, 2.66-3.39 in others); and by dorsal coloration and pattern. T. elusiva can be differentiated from T. gnoma by being larger (dorsum length = 645 in T. elusiva, 540-595 in T. gnoma); having a more elongate rostrum (length/width = 3.65 in T. elusiva, 2.74-3.13 in T. gnoma); and dorsal coloration. T. elusiva can be differentiated from T. mjolniri and T. ivyae by having stockier pedipalp tibiae (length/width = 4.42 in T. elusiva, 5.00-6.00 in others); and a stockier rostrum (length/width = 3.65 in T. elusiva, 3.81-4.32 in others). T. elusiva can be differentiated from T. raptor by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.50 in T. elusiva, 1.8-2.02 in T. raptor); shorter anterior venter (163.75 in T. elusiva, 205-240 in T. raptor); and stockier pedipalp tibiae (length/width = 4.42 in T. elusiva, 6-7.54 in T. raptor). T. elusiva can be differentiated from *T. danielleae* by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.5 in *T. elusiva*, 1.57–1.70 in *T. danielleae*) and by dorsal coloration. *T.* elusiva cannot be confidently differentiated from T. longitibia because T. elusiva is only known from a single female and *T. longitibia* is only known from two males; however, T. elusiva is only known from Charlotte County, New Brunswick, whereas T. longitibia is only known from Monroe County, Tennessee. Additionally, two character systems

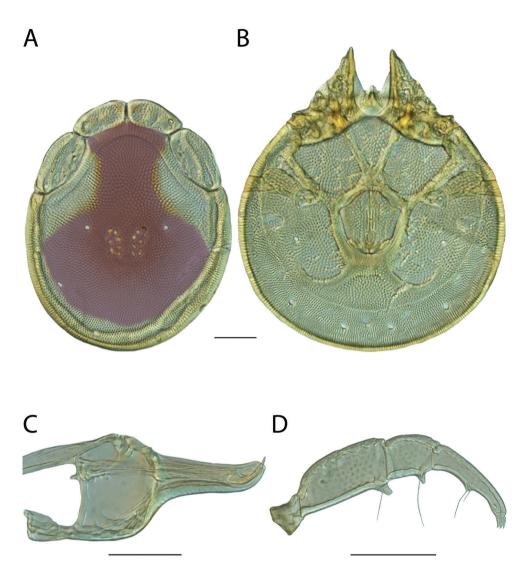

Figure 71. *Torrenticola elusiva* sp. n. female: **A** dorsal plates, coloration added **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

that vary minimally between sexes are rostrum and pedipalp tibiae proportions, which do differ between *T. elusiva* and *T. longitibia* as follows: pedipalp tibia stockier (4.42 in *T. elusiva*, 5.5–5.5 in *T. longitibia*) and rostrum stockier (3.65 in *T. elusiva*, 4.15–4.23 in *T. longitibia*).

Description. FEMALE (Figure 71) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum — (645 long; 500 wide) circular with bluish-purple coloration posteriorly with a broad anterior extension reaching the anterior edge of the dorsal plate. Anterio-

medial platelets (152.5 long; 70 wide). Anterio-lateral platelets (182.5 long; 87.5 wide) free from dorsal plate. Dgl-4 much closer to the muscle scars than to edge of dorsum (distance between Dgl-4 200). Dorsal plate proportions: dorsum length/width 1.29; dorsal width/distance between Dgl-4 2.50; anterio-medial platelet length/width 2.18; anterio-lateral platelet length/width 2.09; anterio-lateral/anterio-medial length 1.20.

Gnathosoma — **Subcapitulum** (340 long (ventral); 259 long (dorsal); 142.5 tall) colorless. Rostrum (155 long; 42.5 wide) elongate. Chelicerae (333 long) with curved fangs (59 long). Subcapitular proportions: ventral length/height 2.39; rostrum length/ width 3.65. **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions with dentate tip on femora and tuberculate ventral extensions on genua. Palpomeres: trochanter (48.75 long); femur (132.5 long); genu (72.5 long); tibia (105 long; 23.75 wide); tarsus (17.5 long). Palpomere proportions: femur/genu 1.83; tibia/femur 0.79; tibia length/width 4.42.

Venter — (730 long; 554 wide) colorless. Gnathosomal bay (176.25 long; 87.5 wide). Cxgl-4 subapical. **Medial suture** (17.5 long). **Genital plates** (167.5 long; 150 wide). Additional measurements: Cx-1 (288 long (total); 115 long (medial)); Cx-3 (384 wide); anterior venter (163.75 long). Ventral proportions: gnathosomal bay length/width 2.01; anterior venter/genital field length 0.98; anterior venter length/ genital field width 1.09; anterior venter/medial suture 9.36.

MALE unknown.

IMMATURES unknown.

Etymology. Specific epithet (*elusiva*) refers to the fact that we were only able to find a single specimen of this species, despite extensive searching among the abundant samples taken from the type locality in New Brunswick.

Distribution. Known only from Charlotte County, New Brunswick (Figure 70).

Remarks. *Torrenticola elusiva* groups with other members of the Raptor Complex in all analyses with high support. Only one specimen could be acquired for use in our analyses, so differences in COI sequence across specimens could not be investigated, but this single specimen was greater than 4% different in COI sequence from sister species. Furthermore, this species is known from only a single female, so morphological variation could not be investigated. However, this specimen was different enough in terms of morphology and sequence to warrant a separate description. We place this species within the Raptor Identification group based upon similarity with those species.

This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Torrenticola erectirostra Fisher & Dowling, sp. n. http://zoobank.org/CD5D74ED-B8CA-44A9-863F-15C3028F6580

Material examined. HOLOTYPE (\bigcirc): from Canada, New Brunswick, York County, Stanley, Nashwaak River, Stanley Municipal Park, 19 Jun 2012, by IM Smith, IMS120031, DNA 2962.

Figure 72. Torrenticola erectirostra sp. n. distribution.

PARATYPES (9 \bigcirc ; 9 \bigcirc): New Brunswick, Canada: 3 \bigcirc from Charlotte County, Rollingham, Digdeguash River, beside Highway 770 at covered bridge, 30 Jun 1989, by IM Smith, IMS890053 • 1 \bigcirc and 2 \bigcirc from Charlotte County, Digdeguash River, beside Sorrel Ridge Road west of Whittier Road, 10 Jun 2012, by IM Smith, IMS120015 • 4 \bigcirc and 4 \bigcirc from York County, Magaguadavic River, beside Highway 3 just east of Thomaston Corners, 1 Jul 1989, by IM Smith, IMS890055A • 1 🖧 (ALLOTYPE) from York County, Stanley, Davis Brook, beside Highway 3, 3.5 km south of Highway 4 at Thomaston Corner, 11 Jun 2012, by IM Smith, IMS120017, DNA 2964 • 2 \bigcirc and 1 d from New Brunswick, York County, Stanley, Davis Brook, beside Highway 3, 3.5 km south of Highway 4 at Thomaston Corner, 11 Jun 2012, by IM Smith, IMS120017 • Maine, USA: $1 \, \bigcirc$ from Aroostook County, Ashland, beside Route 11, Aroostook River (46°38'N 68°24'W), 4 Jul 1989, by IM Smith, IMS890067 • New York, USA: 1 d from Cayuga County, Dutch Hollow Brook, beside Route 38A at Niles, 22 Jul 1990, by IM Smith, IMS900113A • Virginia, USA: 1 2 from Amherst County, beside Blue Ridge, Otter Creek (37°36'57"N, 79°19'27"W), 7 Sep 2007, by IM Smith, IMS070056A.

Type deposition. Holotype (\bigcirc) , allotype (O), and most paratypes $(6 \bigcirc; 4 \textcircled{O})$ deposited in the CNC; other paratypes $(3 \heartsuit; 4 \textcircled{O})$ deposited in the ACUA.

Diagnosis. *Torrenticola erectirostra* are similar to other members of the Erectirostra Group (*T. karambita* and *T. robisoni*), species with similar dorsal patterning, such as

Rusetria "4-Plate" group (*T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. ru-foalba* and *T. shubini*), Elongata Group (*T. gorti* and *T. elongata*), Neoanomala Group (*T. interiorensis* and *T. neoanomala*), *T. bondi, T. irapalpa, T. racupalpa*, and *T. skvarlai*. They can be differentiated from all other *Torrenticola*, except *T. karambita* and *T. ro-bisoni*, by having a dentate, upturned rostrum that is wide when viewed ventrally. *T. erectirostra* can be differentiated from *T. karambita* by having dorsal coloration (*T. karambita* is colorless) and a slightly more elongate rostrum (length/width Q = 1.72-1.91 in *T. erectirostra*, 1.57–1.62 in *T. karambita*; $\mathcal{J} = 2.0-2.2$ in *T. erectirostra*, 1.6–1.95 in *T. karambita*). *T. erectirostra* can be differentiated from *T. robisoni* by having less elongate anterio-lateral platelets (length/width Q = 2.52-2.69 in *T. erectirostra*, 2.96–3.00 in *T. robisoni*) and by being distributed in the Appalachians, while *T. robisoni* is in the Interior Highlands.

Description. FEMALE (Figure 73) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (690–750 (735) long; 480–510 (510) wide) ovoid with bluish-purple or purple coloration separated into anterior and posterior portions with orange medially. Anterio-medial platelets (150–165 (162.5) long; 62.5–75 (75) wide). Anterio-lateral platelets (195–225 (220) long; 77.5–83.75 (82.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 325–370 (370)). Dorsal plate proportions: dorsum length/width 1.41–1.47 (1.44); dorsal width/distance between Dgl-4 1.38–1.51 (1.38); anterio-medial platelet length/width 2.17–2.48 (2.17); anterio-lateral platelet length/width 2.52–2.69 (2.67); anterio-lateral/anterio-medial length 1.26–1.36 (1.35).

Gnathosoma — **Subcapitulum** (315–350 (350) long (ventral); 225–247.5 (247.5) long (dorsal); 130–140 (130) tall) colorless. Rostrum (105–125 125) long; 55–72.5 (72.5) wide) wide and upturned with dentation. Chelicerae (320–345 (345) long) with curved fangs (45–55 (45) long). Subcapitular proportions: ventral length/ height 2.42–2.69 (2.69); rostrum length/width 1.72–1.91 (1.72). **Pedipalps** short and stocky (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–55 (50) long); femur (100–107.5 (102.5) long); genu (57.5–67.5 (57.5) long); tibia (50–65 (62.5) long; 27.5–30 (28.75) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.48–1.78 (1.78); tibia/femur 0.50–0.61 (0.61); tibia length/width 1.82–2.17 (2.17).

Venter — (860–920 (900) long; 580–650 (650) wide) colorless. Gnathosomal bay (210–220 long; 105–150 wide). Cxgl-4 far from apex. **Medial suture** (17.5–27.5 (22.5) long). **Genital plates** (187.5–202.5 (202.5) long; 162.5–180 (180) wide). Additional measurements: Cx-1 (330–360 (350) long (total); 140–160 (160) long (medial)); Cx-3 (410–460 (460) wide); anterior venter (192.5–220 (220) long). Ventral proportions: gnathosomal bay length/width 1.47–2.00; anterior venter/genital field length 0.98–1.09 (1.09); anterior venter length/genital field width 1.13–1.25 (1.22); anterior venter/medial suture 7.09–12.14 (9.78).

MALE (Figure 74) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsal plate proportions: dorsum length/width 1.41–1.55 (1.55); dorsal width/distance between Dgl-4 1.33–1.45 (1.33); anterio-medial platelet

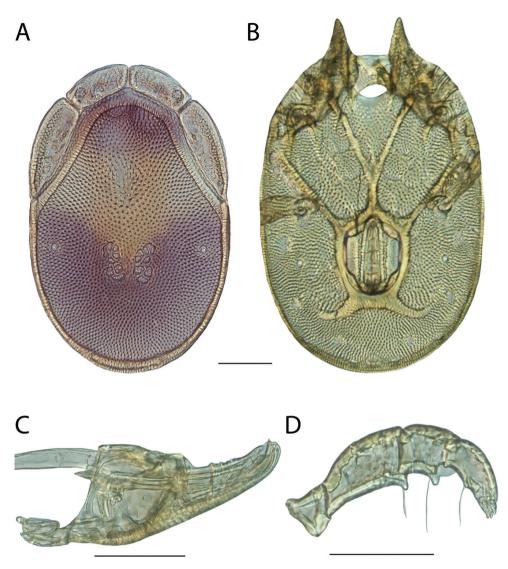

Figure 74. *Torrenticola erectirostra* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

length/width 2.26–2.73 (2.36); anterio-lateral platelet length/width 2.78–3.20 (2.98); anterio-lateral/anterio-medial length 1.37–1.48 (1.48).

Gnathosoma — **Subcapitulum** (270–292.5 (285) long (ventral); 175–215 (197.5) long (dorsal); 96.25–110 (105) tall) colorless. Rostrum (90–107.5 (98.75) long; 45–50 (46.25) wide) wide and upturned with dentation. Chelicerae (265–285 (265) long) with curved fangs (45–50 (50) long). Subcapitular proportions: ventral length/height 2.45–2.86 (2.71); rostrum length/width 2.00–2.17 (2.14). **Pedipalps**

short and stocky (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–47.5 (42.5) long); femur (80–91.25 (87.5) long); genu (55–57.5 (55) long); tibia (50–57.5 (50) long; 23.75–27.5 (23.75) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.39–1.59 (1.59); tibia/femur 0.57–0.63 (0.57); tibia length/width 2.00–2.11 (2.11).

Venter — (720–780 (750) long; 470–495 (470) wide) colorless. Gnathosomal bay (167.5–177.5 (172.5) long; 100–105 (105) wide). Cxgl-4 far from apex. **Medial suture** (75–82.5 (75) long). **Genital plates** (152.5–165 (157.5) long; 112.5–125 (112.5) wide). Additional measurements: Cx-1 (290–330 (310) long (total); 125–150 (140) long (medial)); Cx-3 (360–390 (360) wide); anterior venter (232.5–250 (250) long). Ventral proportions: gnathosomal bay length/width 1.60–1.78 (1.64); anterior venter/genital field length 1.47–1.64 (1.59); anterior venter length/genital field width 1.94–2.22 (2.22); anterior venter/medial suture 2.94–3.33 (3.33).

IMMATURES unknown.

Etymology. Specific epithet (*erectirostra*) refers to the upturned rostrum characteristic of members of the Erectirostra Group (*erectus*, raised up; *rostrum*, L. snout).

Distribution. Appalachians (Figure 72).

Remarks. *Torrenticola erectirostra* groups with other members of the Raptor Complex with high support and specimens are 2.7% different from each other in COI sequence. This variation in COI is higher than in most species hypotheses proposed herein, especially since those specimens were form the same region (New Brunswick). However, we could not find morphological differences that corresponded to clades in our analysis, and we were only able to examine four sequence, therefore, we consider these specimens to represent a single species hypothesis.

This species groups with *T. karambita* and *T. robisoni* to form the Erectirostra Identification Group, which can be readily identified by the shape of the rostrum.

This species hypothesis is supported by biogeography, molecular divergence (although COI variation is greater than most hypotheses herein), and by the morphological characters outlined in the diagnosis.

Torrenticola feminellai Fisher & Dowling, sp. n. http://zoobank.org/2978C7F1-76AE-4DAE-BDB8-550F75271E50

Material examined. HOLOTYPE (\bigcirc): from USA, Georgia, Chattooga County, Cloudland; beside Rt. 48 just east of Alabama state line, (34°31'31"N, 85°30'30"W), 29 September 2005, by IM Smith, IMS050110A.

PARATYPES (4 \bigcirc ; 6 \circlearrowright): **Georgia, USA** : 2 \bigcirc and 4 \circlearrowright from Chattooga County, Cloudland; beside Rt. 48 just east of Alabama State line, (34°31'31"N, 85°30'30"W), 28 September 1992, by IM Smith, IMS920056A • 1 \circlearrowright (ALLOTYPE) from Chattooga County, Cloudland; beside Rt. 48 just east of Alabama state line, (34°31'31"N, 85°30'30"W), 29 September 2005, by IM Smith, IMS050110A • 2 \heartsuit and 1 \circlearrowright

Figure 75. Torrenticola feminellai sp. n. distribution.

from Chattooga County, Cloudland; beside Rt. 48 just east of Alabama state line, (34°31'31"N, 85°30'30"W), 29 September 2005, by IM Smith, IMS050110A.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 3 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola feminellai are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malarkeyorum, T. pendula, T. sellersorum, T. tysoni, T. ululata, T. whitneyae*, and *T. microbiscutella*) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except *T. ululata* and *T. indistincta*), and being distributed in the east. *T. feminellai* can be differentiated from all other Eastern 2-Plates by having a more elongate rostrum (length/width Q = 3.05–3.38 in *T. feminellai*, 2.33–3.00 in others; $\mathcal{J} = 3.14$ –3.38 in *T. feminellai*, 2.50–3.05 in others), except *T. tysoni* (3.06–3.50). Additionally, *T. feminellai* can be differentiated from all other Eastern 2-Plates by having a distinct dorsal pattern.

Description. FEMALE (Figure 76) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–690 (640) long; 470–540 (500) wide) circular with reddishpurple coloration in the shape of an hourglass. Anterio-medial platelets (137.5–150 (150) long; 52.5–55 (55) wide). Anterio-lateral platelets (185–202.5 (202.5) long;

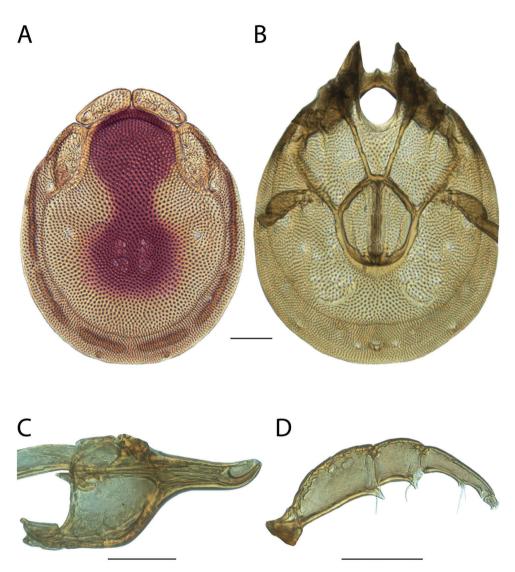

Figure 76. *Torrenticola feminellai* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

75–80 (75) wide) partially fused to dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 290–310 (290)). Dorsal plate proportions: dorsum length/width 1.24–1.33 (1.28); dorsal width/distance between Dgl-4 1.59–1.74 (1.72); anterio-medial platelet length/width 2.62–2.76 (2.73); anterio-lateral platelet length/width 2.34–2.70 (2.70); anterio-lateral/anterio-medial length 1.25–1.36 (1.35).

Gnathosoma — **Subcapitulum** (320–357.5 (352.5) long (ventral); 245–275 (267.5) long (dorsal); 140–160 (160) tall) colorless. Rostrum (135–157.5 (145) long;

40–47.5 (47.5) wide). Chelicerae (335–375 (375) long) with curved fangs (65–75 (70) long). Subcapitular proportions: ventral length/height 2.17–2.30 (2.20); rostrum length/width 3.05–3.38 (3.05). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (46.25–52.5 (52.5) long); femur (117.5–140 (140) long); genu (65–77.5 (75) long); tibia (90–100 (100) long; 22.5–25 (25) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.73–1.87 (1.87); tibia/femur 0.71–0.77 (0.71); tibia length/width 3.85–4.11 (4.00).

Venter — (670-760 (700) long; 550-690 (550) wide) colorless. Gnathosomal bay (177.5–195 (195) long; 80–115 (80) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (185–195 (195) long; 167.5–180 (170) wide). Additional measurements: Cx-1 (310–320 (320) long (total); 120–140 (125) long (medial)); Cx-3 (340–410 (360) wide); anterior venter (130–140 (130) long). Ventral proportions: gnathosomal bay length/width 1.61–2.44 (2.44); anterior venter/genital field length 0.67–0.76 (0.67); anterior venter length/genital field width 0.74–0.82 (0.76).

MALE (Figure 77) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (520–565 (545) long; 370–410 (390) wide) circular with reddishpurple coloration in the shape of an hourglass. Anterio-medial platelets (115–126.25 (122.5) long; 42.5–50 (45) wide). Anterio-lateral platelets (150–180 (155) long; 55– 67.5 (60) wide) partially fused to dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 215–250 (245)). Dorsal plate proportions: dorsum length/width 1.36–1.42 (1.40); dorsal width/distance between Dgl-4 1.54–1.72 (1.59); anterio-medial platelet length/width 2.42– 2.82 (2.72); anterio-lateral platelet length/width 2.58–2.77 (2.58); anterio-lateral/ anterio-medial length 1.27–1.43 (1.27).

Gnathosoma — **Subcapitulum** (270–300 (290) long (ventral); 200–227.5 (215) long (dorsal); 105–120 (115) tall) colorless. Rostrum (110–120 (120) long; 32.5–37.5 (37.5) wide). Chelicerae (270–310 (295) long) with curved fangs (50–60 (55) long). Subcapitular proportions: ventral length/height 2.50–2.59 (2.52); rostrum length/ width 3.14–3.38 (3.20). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–45 (42.5) long); femur (95–112.5 (105) long); genu (60–65 (62.5) long); tibia (77.5–86.25 (85) long; 20–23.75 (21.25) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.58–1.75 (1.68); tibia/ femur 0.76–0.82 (0.81); tibia length/width 3.63–4.00 (4.00).

Venter — (610–685 (640) long; 415–470 (470) colorless. Gnathosomal bay (135–160 (155) long; 62.5–70 (62.5) wide). Cxgl-4 subapical. **Medial suture** (65–75 (70) long). **Genital plates** (130–140 (140) long; 115–125 (120) wide). Additional measurements: Cx-1 (245–290 (270) long (total); 105–130 (120) long (medial)); Cx-3 (285–315 (315) wide); anterior venter (190–205 (195) long). Ventral proportions: gnathosomal bay length/width 2.00–2.48 (2.48); anterior venter/genital field length 1.39–1.49 (1.39); anterior venter length/genital field width 1.58–1.72 (1.63); anterior venter/medial suture 2.60–2.93 (2.79).

IMMATURES unknown.

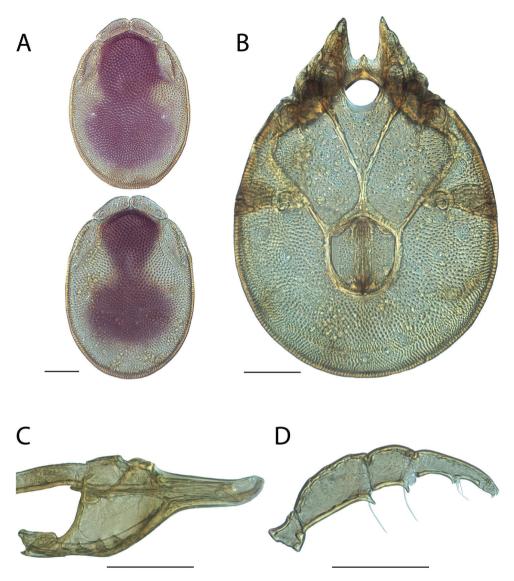

Figure 77. *Torrenticola feminellai* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Etymology. Specific epithet (*feminellai*) named in honor of Jack Feminella, professor of biology at Auburn University, who believed in me (JRF) enough to employ me as a lab technician in stream ecology, write a winning recommendation letter for graduate school, and was the first to teach me how to conduct self-directed research.

Distribution. Southern Appalachians, Georgia (Figure 75).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenti*cola feminellai and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution in the east, and fusion of the dorso-lateral platelets to the dorsal plate, are consistent with placing this species in the Rusetria Complex and the Eastern 2-Plate Identification Group.

Torrenticola flangipalpa Fisher & Dowling, sp. n. http://zoobank.org/FDF11FC8-56B5-49BE-B5FC-CF7D42E9213E

Material examined. HOLOTYPE (\bigcirc): from USA, Alabama, Lauderdale County, Natchez Trace Parkway, (34°56'31"N, 87°49'41"W), 27 Sep 2010, by IM Smith, IMS100162, DNA 1310.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (3 \bigcirc ; 4 \circlearrowright) deposited in the CNC; other paratypes (2 \bigcirc ; 2 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola flangipalpa are similar to other members of the Nigroalba Group (T. nigroalba, T. solisorta, and T. dentirostra) in being small, slightly elongate, having purple dorsal coloration restricted posteriorly, and having distinct yet poorlydefined hind coxal margins (can be indistinct, at least in males). T. flangipalpa are best differentiated from other members of the Nigroalba Group by having a flange-like, anteriorly-directed pedipalp femoral extension (this extension is tuberculate in other members of the Nigroalba Group). Additionally, T. flangipalpa can be differentiated from T. nigroalba and T. solisorta by having a longer anterior venter (235-265 in T. *flangipalpa*; 192–225 in others) and stockier pedipalpal tibiae (length/width Q = 4.79– 5.0 in *T. flangipalpa*, 5.38–5.83 in others; length/width 3 = 4.4-4.86 in *T. flangipalpa*, 5.08–5.33 in others). T. flangipalpa can be differentiated from T. dentirostra by having a smooth rostrum (*T. dentirostra* has a dentate bump midway on the dorsal edge of the rostrum). Other Torrenticola with purple dorsal coloration restricted posteriorly, such as *T. tahoei* and *T. oregonensis* are larger (dorsum length Q = 530-565 in *T. flangipalpa*, 600–810 in others; 3 = 480-510 in *T. flangipalpa*, 560–820 in others) and distributed in the west (*T. flangipalpa* is only known from Alabama and Tennessee).

Figure 78. Torrenticola flangipalpa sp. n. distribution.

Description. FEMALE (Figure 79) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (530–580 (545) long; 365–425 (380) wide) ovoid with purple or bluish-purple coloration restricted posteriorly. Anterio-medial platelets (112.5130 (127.5) long; 47.5–57.5 (47.5) wide). Anterio-lateral platelets (157.5–175 (172.5) long; 55–62.5 (55) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 255–295 (255)). Dorsal plate proportions: dorsum length/width 1.33–1.45 (1.43); dorsal width/distance between Dgl-4 1.39–1.49 (1.49); anterio-medial platelet length/width 2.25–2.74 (2.68); anterio-lateral platelet length/width 2.86–3.14 (3.14); anterio-lateral/anterio-medial length 1.29–1.40 (1.35).

Gnathosoma — **Subcapitulum** (305–330 (307.5) long (ventral); 225–255 (225) long (dorsal); 90–95 (90) tall) elongate and colorless. Rostrum (112.5–130 (117.5) long; 37.5–42.5 (37.5) wide) elongate. Chelicerae (285–320 (286) long) with curved fangs (43–50 (44) long). Subcapitular proportions: ventral length/height 3.39–3.47 (3.42); rostrum length/width 2.82–3.06 (3.00). Pedipalps elongate (especially tibiae) with broad, dentate, anteriorly-directed flange on femora and with variable, dentate flange-like extension on genua. Palpomeres: trochanter (32.5–35 (35) long); femur (93.75–102.5 (93.75) long); genu (55–62.5 (55) long); tibia (80–90 (83.75) long;

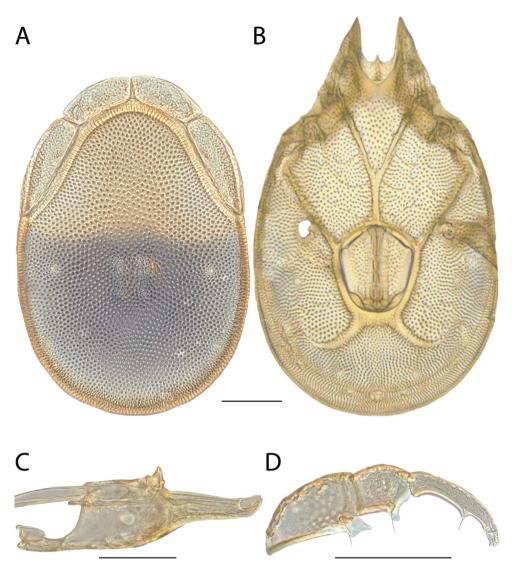

Figure 79. *Torrenticola flangipalpa* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

16.25–18.75 (17.5) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.60–1.70 (1.70); tibia/femur 0.82–0.90 (0.89); tibia length/width 4.79– 5.00 (4.79).

Venter — (680–750 (680) long; 430–495 (436) wide) with faint purple or bluish-purple coloration. Gnathosomal bay (112.5–140 (120) long; 67.5–75 (67.5) wide). Cxgl-4 far from apex. **Medial suture** (67.5–80 (67.5) long). **Genital plates** (145–160 (151.25) long; 125–132.5 (125) wide). Additional measurements: Cx-1

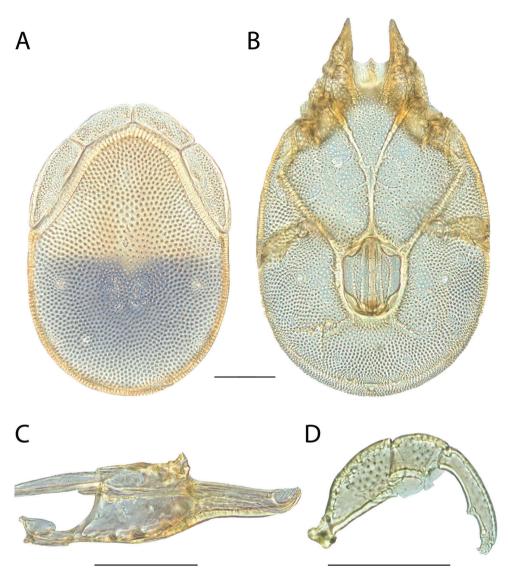

Figure 80. *Torrenticola flangipalpa* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(266–310 (266) long (total); 150–170 (156) long (medial)); Cx-3 (278–321 (278) wide); anterior venter (235–255 (245) long). Ventral proportions: gnathosomal bay length/width 1.50–2.00 (1.78); anterior venter/genital field length 1.55–1.76 (1.62); anterior venter length/genital field width 1.86–2.04 (1.96); anterior venter/medial suture 3.06–3.78 (3.63).

MALE (Figure 80) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (480–510 (480) long; 330–370 (330) wide) ovoid with purple or bluish-purple coloration restricted posteriorly. Anterio-medial platelets (112.5–122.5 (115) long; 41.25–47.5 (41.25) wide). Anterio-lateral platelets (152.5–162.5 (152.5) long; 50–53.75 (50) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 235–260 (235)). Dorsal plate proportions: dorsum length/width 1.38–1.45 (1.45); dorsal width/distance between Dgl-4 1.39–1.44 (1.40); anterio-medial platelet length/width 2.42–2.79 (2.79); anterio-lateral platelet length/width 3.02–3.10 (3.05); anterio-lateral/anterio-medial length 1.33–1.44 (1.33).

Gnathosoma — **Subcapitulum** (272.5–290 (272.5) long (ventral); 200–209 (200) long (dorsal); 75–87.5 (75) tall) elongate and colorless. Rostrum (102.5–107.5 (105) long; 32.5-35 (35) wide) elongate. Chelicerae (250–272 (260) long) with curved fangs (39–62 (40) long). Subcapitular proportions: ventral length/height 3.31–3.68 (3.63); rostrum length/width 2.93–3.31 (3.00). Pedipalps elongate (especially tibiae) with broad, dentate, anteriorly-directed flange on femora and with variable, dentate flange-like extension on genua. Palpomeres: trochanter (27.5–31.25 (27.5) long); femur (85–90 (87.5) long); genu 47.5–57.5 (55) long); tibia (77.5–85 (80) long; 17.5–18.75 (17.5) wide); tarsus (12.5–15 (12.5) long). Palpomere proportions: femur/genu 1.52–1.79 (1.59); tibia/femur 0.91–0.94 (0.91); tibia length/width 4.40–4.86 (4.57).

Venter — (600–640 (600) long; 356–420 (380) wide) with faint purple or bluishpurple coloration. Gnathosomal bay (100–112.5 (105) long; 65–72.5 (65) wide). Cxgl-4 far from apex. **Medial suture** (82.5–107.5 (95) long). **Genital plates** (122.5–127.5 (122.5) long; 92.5–100 (95) wide). Additional measurements: Cx-1 (240–258 (240) long (total); 122–160 (135) long (medial)); Cx-3 (251–291 (265) wide); anterior venter (245–265 (245) long). Ventral proportions: gnathosomal bay length/width 1.48–1.62 (1.62); anterior venter/genital field length 1.98–2.12 (2.00); anterior venter length/ genital field width 2.55–2.68 (2.58); anterior venter/medial suture 2.42–3.00 (2.58).

IMMATURES unknown.

Etymology. Specific epithet (*flangipalpa*) refers the expanded (i.e., flanged) pedipalp femoral tubercle (*flange*, English; *palpus*, L. hand, feeler), which distinguishes this species from other members of the Nigroalba Group.

Distribution. Southeastern (Figure 78).

Remarks. *Torrenticola flangipalpa* groups with other members of the Raptor Complex with high support in all analyses and specimens are less than 1% different in COI sequence from each other. In all analyses, *T. flangipalpa* groups with two other morphologically similar species: *T. nigroalba* and *T. solisorta*. These three species are greater than 12% different from each other in COI sequence.

That clade of three species corresponds to an identification group, Nigroalba Group, the members of which are easily differentiated by their size, coloration, long medial suture in females, and overall appearance.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola folkertsae Fisher & Dowling, sp. n. http://zoobank.org/9AB5AC1A-6839-4690-8E1B-0945B5942351

Material examined. HOLOTYPE (\bigcirc): from USA, New Hampshire, Coos County, picnic area beside Rt. 110 ca. 1 km east of Stark, (44°36'36"N, 71°24'24"W), 5 July 1989, by IM Smith, IMS890071

PARATYPES (4 \bigcirc ; 4 \bigcirc): 1 \bigcirc (ALLOTYPE) from Coos County, New Hampshire picnic area beside Rt. 110 ca. 1 km east of Stark, (44°36'36"N, 71°24'24"W), 5 July 1989, by IM Smith, IMS890071 • 4 \bigcirc and 4 \bigcirc from Coos County, picnic area beside Rt. 110 ca. 1 km east of Stark, (44°36'36"N, 71°24'24"W), 5 July 1989, by IM Smith, IMS890071.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola folkertsae are similar to other members of the Partial 2-Plate Group (*T. magnexa*, *T. priapus*, and *T. pulchra*) in having anterio-lateral platelets partially fused to the dorsal plate and being distributed in the east. *T. folkertsae* can be differentiated from *T. magnexa* and *T. pulchra* by having more elongate pedipalpal tibiae (length/width = 4.05–4.83 in *T. folkertsae*, 2.61–4.00 in others) and by dorsal coloration and pattern. *T. folkertsae* can be differentiated from *T. priapus* by having more elongate pedipalpal tibiae (length/width Q = 4.5–4.83 in *T. folkertsae*, 3.9–4.22 in *T. priapus* $\delta = 4.05$ –4.33 in *T. folkertsae*, 3.5–3.78 in *T. priapus*) and a less elongate rostrum (length/width = 2.55–3.00 in *T. folkertsae*, 3.17–3.39 in *T. priapus*).

Description. FEMALE (Figure 82) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (600–720 (720) long; 505–600 (580) wide) ovoid with faint reddishpurple medially. Anterio-medial platelets (140–167.5 (156.25) long; 57.5–70 (65) wide). Anterio-lateral platelets (180–205 (185) long; 85–95 (85) wide) partially fused to dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 340–380 (380)). Dorsal plate proportions: dorsum length/width 1.11–1.24 (1.24); dorsal width/distance between Dgl-4 1.40–1.75 (1.53); anteriomedial platelet length/width 2.32–2.50 (2.40); anterio-lateral platelet length/width 2.12–2.31 (2.18); anterio-lateral/anterio-medial length 1.12–1.41 (1.18).

Gnathosoma — **Subcapitulum** (310–345 (345) long (ventral); 240–270 (270) long (dorsal); 145–162.5 (157.5) tall) colorless. Rostrum (135–150 (140) long; 50–55 (55) wide). Chelicerae (320–415 (415) long) with curved fangs (65–70 (70) long). Subcapitular proportions: ventral length/height 2.07–2.19 (2.19); rostrum length/ width 2.55–2.86 (2.55). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (48.75–52.5 (52.5) long); femur (130–145 (145) long); genu (77.5–87.5 (87.5) long); tibia (108.75–120 (118.75) long; 22.5–26.25 (26.25) wide); tarsus (17.5–22.5 (22.5) long). Palpomere proportions: femur/genu 1.65–1.68 (1.66); tibia/femur 0.82–0.87 (0.82); tibia length/width 4.50–4.83 (4.52).

Venter — (680–880 (860) long; 560–675 (650) wide) colorless. Gnathosomal bay (167.5–185 (182.5) long; 80–95 (95) wide). Cxgl-4 far from apex. Medial su-

Figure 81. Torrenticola folkertsae sp. n. distribution.

ture (15–20 (20) long). Genital plates (175–197.5 (197.5) long; 167.5–175 (167.5) wide). Additional measurements: Cx-1 (300–340 (330) long (total); 127.5–157.5 (145) long (medial)); Cx-3 (380–400 (400) wide); anterior venter (155–180 (180) long). Ventral proportions: gnathosomal bay length/width 1.92–2.13 (1.92); anterior venter/genital field length 0.79–1.00 (0.91); anterior venter length/genital field width 0.91–1.07 (1.07); anterior venter/medial suture 8.38–12.00 (9.00).

MALE (Figure 83) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (535–580 (570) long; 420–450 (445) wide) ovoid with faint reddishpurple medially. Anterio-medial platelets (125–135 (135) long; 55–65 (55) wide). Anterio-lateral platelets (180–187.5 (180) long; 62.5–77.5 (77.5) wide) partially fused to dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 280–310 (310)). Dorsal plate proportions: dorsum length/width 1.27–1.29 (1.28); dorsal width/distance between Dgl-4 1.44–1.54 (1.44); anteriomedial platelet length/width 2.04–2.45 (2.45); anterio-lateral platelet length/width 2.32–2.88 (2.32); anterio-lateral/anterio-medial length 1.33–1.48 (1.33).

Gnathosoma — **Subcapitulum** (265–292.5 (292.5) long (ventral); 210–227.5 (227.5) long (dorsal); 110–115 (110) tall) colorless. Rostrum (110–120 (120) long; 40–42.5 (40) wide). Chelicerae (275–295 (295) long) with curved fangs (55–57.5 (55) long). Subcapitular proportions: ventral length/height 2.36–2.66 (2.66); rostrum

ditional measurements: Cx-1 (255–295 (295) long (total); 130–150 (150) long (medial)); Cx-3 (330–365 (340) wide); anterior venter (250–275 (267.5) long). Ventral proportions: gnathosomal bay length/width 1.81–2.00 (1.90); anterior venter/genital field length 1.79–1.96 (1.84); anterior venter length/genital field width 2.00–2.16 (2.06); anterior venter/medial suture 2.17–2.45 (2.33).

IMMATURES unknown.

Etymology. Specific epithet (*folkertsae*) named in honor of Debbie Folkerts, professor of biology at Auburn University, who, together with her late husband George Folkerts, were instrumental to JRF in channeling his passion for natural history and teaching into a career path.

Distribution. New Hampshire (Figure 81).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola folkertsae* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution, and partial fusion of the dorso-lateral platelets to the dorsal plate, are consistent with placing this species in the Rusetria Complex and the Partial 2-Plate Identification Group.

Torrenticola glomerabilis Fisher & Dowling, sp. n. http://zoobank.org/CF3075B3-56EC-4A3C-95E5-C0DEF4C6AD8A

Material examined. HOLOTYPE (\bigcirc): from USA, Tennessee, Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail (35°40'47"N, 83°31'51"W), 10 Sep 2010, by IM Smith, IMS100125.

PARATYPES (23 \mathfrak{Q} ; 25 \mathfrak{Z}): Georgia, USA: 2 \mathfrak{Q} and 2 \mathfrak{Z} from Floyd County, beside road from Everett Spring to Villanow, 1.4 kilometers south of The Pocket Campground, tributary of Johns Creek, 4 Jul 1990, by IM Smith, IMS900077 • Ken**tucky, USA:** 2 \bigcirc and 3 \bigcirc from Bell County, Middlesboro, near north boundary of Cumberland Gap National Historical Park, Sugar Run, 9 Jul 1990, by IM Smith, IMS900084 • 2 \bigcirc and 1 \bigcirc from Bell County, Pineville, Pine Mountain State Resort Park, Laurel Cove, Lower shelter Picnic Area, 9 Jul 1990, by IM Smith, IMS900083 • Pennsylvania, USA: 1 \bigcirc from Fayette County, Dunbar Creek (39°57'50"N, 79°35′8.70″W), 10 Aug 2014, by MJ Skvarla, MS 14-0810-001 • 1 ♀ from Huntingdon County, Alan Seeger Natural Area, beside road from McAlevys Fort to Route 322, Stone Creek, 19 Jul 1990, by IM Smith, IMS900107 • Tennessee, USA: 1 👌 (AL-LOTYPE) from Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail (35°40'47"N, 83°31'51"W), 10 Sep 2010, by IM Smith, IMS100125 • 1 👌 from Sevier County, Great Smokey Mountains National Park, Laurel Creek (35°39'7"N, 83°42'32"W), 17 Sep 2010, by IM Smith, IMS100145 • 4 ♀ and 5 ♂ from Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail (35°40'47"N, 83°31'51"W), 10 Sep 2010, by IM Smith, IMS100125 • Virginia, USA: 1 \bigcirc and 1 \bigcirc from Alleghany County, Clifton Forge, beside Route 606, 1.2 kilometers southeast of Forest Route 125, Smith Creek, 13 Jul 1990, by IM Smith, IMS900093 • 1 \bigcirc and 1 \bigcirc from Alleghany County, Longdale Furnace, beside Forest Route 108, 1.7 kilometers west of Route 850, Simpson Creek, 14 Jul 1990, by IM Smith, IMS900094 • 1 \bigcirc and 1 \bigcirc from Amherst County, Upper Otter Creek Overlook beside Blue Ridge, Otter Creek (37°36'57"N, 79°19'27"W), 7 Sep 2007, by IM Smith, IMS070056A • 2 \bigcirc and 2 \bigcirc from Augusta County, beside Forest Road 42, 15.9 kilometers east of Vesuvius, Coles Run, 26 Jul 1990, by IM Smith, IMS900060 • 2 👌 from Bath County, beside Forest Route 1744 at Route 39, between Warm Springs and Mountain Grove,

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (18 \bigcirc ; 19 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola glomerabilis are similar to other members of the Rusetria "4-Plate" group (*T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba* and *T. shubini*) and *T. skvarlai* in having anterio-lateral platelets free from the dorsal plate, dorsal coloration separated into anterior and posterior portions, and indistinct hind coxal margins. *T. glomerabilis* can be differentiated from *T. dunni, T. shubini, T. kittatinniana*, by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4

= 1.53–1.66 in *T. glomerabilis*, 1.20–1.42 in others) and stockier tibiae (length/width Q = 4.11-4.50 in *T. glomerabilis*, 3.27–3.60 in others; aarrow = 3.55-4.38 in *T. glomerabilis*, 2.80–3.45 in others). *T. glomerabilis* can be differentiated from *T. pollani* and *T. rufoalba* by having stockier anterio-medial platelets (length/width Q = 1.9-2.3 in *T. glomerabilis*, 2.5–3.0 in others; aarrow = 1.9-2.2 in *T. glomerabilis*, 2.3–2.9 in others) and wider dorsum (Q = 460-490 in *T. glomerabilis*, 400–420 in others; aarrow = 395-430 in *T. glomerabilis*, 310–340 in others). *T. glomerabilis* can be differentiated from *T. skvarlai* by having a conical pedipalpal femoral tubercle, whereas *T. skvarlai* has a broad and flat pedipalpal femoral tubercle, and by having a longer anterior venter (Q = 202-213 in *T. glomerabilis*, 140–153 in *T. skvarlai*; aarrow = 240-280 in *T. glomerabilis*, 177–205 in *T. skvarlai*).

Description. FEMALE (Figure 85) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (580–615 (605) long; 460–490 (475) wide) circular with bold bluishpurple or reddish-purple coloration separated into anterior and posterior portions. Anterio-medial platelets (125–132.5 (132.5) long; 55–65 (60) wide). Anterio-lateral platelets (172.5–195 (180) long; 70–82.5 (82.5) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 280–310 (310)). Dorsal plate proportions: dorsum length/width 1.23–1.32 (1.27); dorsal width/distance between Dgl-4 1.53–1.66 (1.53); anterio-medial platelet length/ width 1.96–2.27 (2.21); anterio-lateral platelet length/width 2.17–2.48 (2.18); anterio-lateral/anterio-medial length 1.36–1.53 (1.36).

Gnathosoma — **Subcapitulum** (320–330 (320) long (ventral); 223–243 (223) long (dorsal); 112.5–120 (117.5) tall) colorless. Rostrum (132.5–137.5 (132.5) long; 40–47.5 (40) wide). Chelicerae (320–330 (321) long) with curved fangs (50–55 (53) long). Subcapitular proportions: ventral length/height 2.72–2.89 (2.72); rostrum length/width 2.89–3.34 (3.31). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (40) long); femur (112.5–117.5 (116.25) long); genu (67.5–70 (67.5) long); tibia (88.75–95 (88.75) long; 20–22.5 (20) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.67–1.74 (1.72); tibia/femur 0.76–0.83 (0.76); tibia length/width 4.11–4.50 (4.44).

Venter — (710–730 (730) long; 512–550 (513) wide) bold bluish-purple or reddish-purple coloration. Gnathosomal bay (130–155 (155) long; 72.5–95 (72.5) wide). Cxgl-4 subapical. **Medial suture** (22.5–50 (27.5) long). **Genital plates** (167.5–177.5 (175) long; 150–157.5 (157.5) wide). Additional measurements: Cx-1 (276–305 (291) long (total); 122–160 (149) long (medial)); Cx-3 (320–370 (321) wide); anterior venter (202.5–212.5 (202.5) long). Ventral proportions: gnathosomal bay length/width 1.37– 2.14 (2.14); anterior venter/genital field length 1.14–1.24 (1.16); anterior venter length/ genital field width 1.29–1.40 (1.29); anterior venter/medial suture 4.15–9.00 (7.36).

MALE (Figure 86) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (495–575 (530) long; 395–430 (420) wide) circular with bold bluishpurple or reddish-purple coloration separated into anterior and posterior portions. Anterio-medial platelets (112.5–120 (120) long; 52.5–60 (55) wide). Anterio-lateral

long; 35–40 (35) wide). Chelicerae (249–298 (285) long) with curved fangs (40–50 (50) long). Subcapitular proportions: ventral length/height 2.77–3.09 (3.09); rostrum length/width 2.80–3.43 (3.43). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–35 (35) long); femur (95–105 (102.5) long); genu (57.5–65 (60) long); tibia (80–88.75 (82.5) long; 20–25 (20) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.58–1.71 (1.71); tibia/ femur 0.80–0.87 (0.80); tibia length/width 3.55–4.38 (4.13).

Venter — (600–690 (670) long; 443–540 (460) wide) bold bluish-purple or reddish-purple coloration. Gnathosomal bay (107.5–135 (132.5) long; 70–80 (70) wide). Cxgl-4 subapical. **Medial suture** (85–107.5 (92.5) long). **Genital plates** (135–147.5 (140) long; 110–120 (117.5) wide). Additional measurements: Cx-1 (224–280 (280) long (total); 88–160 (150) long (medial)); Cx-3 (292–342 (300) wide); anterior venter (240–280 (260) long). Ventral proportions: gnathosomal bay length/width 1.48–1.93 (1.89); anterior venter/genital field length 1.78–1.90 (1.86); anterior venter length/ genital field width 2.13–2.41 (2.21); anterior venter/medial suture 2.47–2.87 (2.81).

IMMATURES unknown.

Etymology. Specific epithet (*glomerabilis*) refers to the rounded body of this species compared to all other members of the Rusetria Complex (*glomerabilis*, L. round).

Distribution. Appalachians (Figure 84).

Remarks. *Torrenticola glomerabilis* groups with other members of the Rusetria Complex with high support and specimens are less than 1% different in COI sequence from each other. In all analyses, *T. glomerabilis* groups with two other species, *T. delicatexa* and *T. ululata*, which are 10–13% different from each other. Of these species, *T. glomerabilis* is the only one with the lateral platelets free from the dorsal plate. Because of this, we place *T. glomerabilis* within the Eastern 4-Plate Identification Group, which can be differentiated by having rounder bodies than any other species in the Rusetria Complex.

Torrenticola glomerabilis occupy an interesting position phylogenetically by being nested between the Eastern 2-Plate and Eastern 4-Plate Identification Groups (Figure 6, 12). Their unique shape and interesting phylogenetic affinity flag this species as important to future studies on the evolution of eastern members of the Rusetria Complex.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola gnoma Fisher & Dowling, sp. n.

Black Creek (33°43'N, 90°3'W), 16 Sep 1991, by IM Smith, IMS910044 • 1 \bigcirc and 1 \bigcirc from Jefferson County, off Natchez Trace Parkway, Coles Creek (31°41'26"N, 91°10'52"W), 2 Oct 1994, by IM Smith, IMS940029A • 1 \bigcirc and 1 \bigcirc from Tishomingo County, Tishomingo State Park, Bear Creek, (34°36'N, 88°11'W), 18 Sep 1991, by IM Smith, IMS910047A • **Oklahoma, USA**: 2 \bigcirc and 2 \bigcirc from Pushmataha County, beside Route 271, South of Albion, Walnut Creek (34°39'N, 95°7'W), 1 Jul 1987, by IM Smith, IMS870063A.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(4 \heartsuit; 5 \circlearrowright)$ deposited in the CNC; other paratypes $(2 \heartsuit; 3 \circlearrowright)$ deposited in ACUA.

Diagnosis. Torrenticola gnoma are similar to other members of the Raptor Group (*T. irapalpa, T. longitibia, T. mjolniri, T. elusiva, T. racupalpa, T. raptor, T. danielleae, T. daemon,* and *T. ivyae*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. gnoma* can be differentiated from *T. elusiva* by being smaller (dorsum length = 540–595 in *T. gnoma,* 645 in *T. elusiva*); having a stockier rostrum (length/width = 2.74–3.13 in *T. gnoma,* 3.65 in *T. elusiva*); and by dorsal coloration. *T. gnoma* can be differentiated from *T. racupalpa* by having a stockier rostrum (length/width = 2.74–3.13 in *T. gnoma,* 3.56–3.88 in *T. racupalpa*) and by dorsal coloration and pattern. *T. gnoma* can be differentiated from *T. irapalpa, T. danielleae,* and *T. daemon* by dorsal coloration and pattern. Additionally, female *T. gnoma* can be differentiated from *T. daemon* by dorsal coloration and pattern. *T. gnoma* can be differentiated from *T. daemon* by dorsal coloration and pattern. *T. gnoma* can be differentiated from *T. irapalpa, T. danielleae,* and *T. daemon* by dorsal coloration and pattern. *Additionally,* female *T. gnoma* can be differentiated from *T. daemon* by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 Q =

2.65–3.29 in *T. gnoma*, 1.57–2.09 in others). *T. gnoma* can be differentiated from *T. mjolniri*, *T. longitibia*, *T. raptor*, and *T. ivyae* by having stockier pedipalp tibiae (length/width = 3.88–4.67 in *T. gnoma*, 4.75–7.54 in others) and a stockier rostrum (length/width = 2.56–3.23 in *T. gnoma*, 3.44–4.4 in others).

Description. FEMALE (Figure 88) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–595 (550) long; 440–500 (455) wide) circular with a large spot of coloration medially extending in a thin strip anteriorly to the edge of the dorsal plate, coloration variable from navy blue to purple to pink. Anterio-medial platelets (122.5–137.5 (131.25) long; 55–62.5 (60) wide). Anterio-lateral platelets (152.5– 187.5 (167.5) long; 67.5–75 (70) wide) free from dorsal plate. Dgl-4 much closer to the muscle scar than to dorsum edge (distance between Dgl-4 140–185 (155)). Dorsal plate proportions: dorsum length/width 1.17–1.30 (1.21); dorsal width/distance between Dgl-4 2.65–3.29 (2.94); anterio-medial platelet length/width 2.06–2.39 (2.19); anterio-lateral platelet length/width 2.26–2.59 (2.39); anterio-lateral/anterio-medial length 1.11–1.46 (1.28).

Gnathosoma — **Subcapitulum** (285–305 (290) long (ventral); 225–239 (226) long (dorsal); 115–135 (120) tall) colorless. Rostrum (122.5–130 (125) long; 40–47.5 (40) wide) elongate. Chelicerae (285–310 (286) long) with curved fangs (53–60 (54) long). Subcapitular proportions: ventral length/height 2.26–2.52 (2.42); rostrum length/width 2.74–3.13 (3.13). **Pedipalps** elongate with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–45 (40) long); femur (110–120 (112.5) long); genu (60–67.5 (62.5) long); tibia (87.5–105 (92.5) long; 20–22.5 (20) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.63–1.88 (1.80); tibia/femur 0.76–0.88 (0.82); tibia length/width 4.17–4.67 (4.63).

Venter — (660–730 (680) long; 500–575 (500) wide) colorless. Gnathosomal bay (142.5–172.5 (152.5) long; 75–92.5 (75) wide). Cxgl-4 subapical. **Medial suture** (15–27.5 (27.5) long). **Genital plates** (152.5–165 (157.5) long; 142.5–152.5 (142.5) wide). Additional measurements: Cx-1 (252–285 (257) long (total); 84–122 (108) long (medial)); Cx-3 (317–377 (318) wide); anterior venter (160–167.5 (165) long). Ventral proportions: gnathosomal bay length/width 1.57–2.16 (2.03); anterior venter/genital field length 0.97–1.10 (1.05); anterior venter length/genital field width 1.05–1.16 (1.16); anterior venter/medial suture 6.00–10.67 (6.00).

MALE (Figure 89) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (420–495 (450) long; 355–375 (375) wide) circular with a large spot of coloration medially extending in a thin strip anteriorly to the edge of the dorsal plate, coloration variable from navy blue to purple to pink. Anterio-medial platelets (1.80–2.30 (2.18) long; 50–62.5 (55) wide). Anterio-lateral platelets (135–152.5 (152.5) long; 60–65 (60) wide) free from dorsal plate. Dgl-4 much closer to the muscle scar than to dorsum edge (distance between Dgl-4 130–180 (165)). Dorsal plate proportions: dorsum length/width 1.17–1.32 (1.20); dorsal width/distance between Dgl-4 2.06–2.73 (2.27); anterio-medial platelet length/width 1.80–2.30 (2.18); anter-

io-lateral platelet length/width 2.16–2.54 (2.54); anterio-lateral/anterio-medial length 1.17–1.36 (1.27).

Gnathosoma— **Subcapitulum** (240–265 (265) long (ventral); 175–196 (196) long (dorsal); 97.5–105 (105) tall) colorless. Rostrum (98.75–107.5 (107.5) long; 35–40 (35) wide) elongate. Chelicerae (225–257 (256) long) with curved fangs (41–51 (50) long). Subcapitular proportions: ventral length/height 2.29–2.56 (2.52); rostrum length/width 2.56–3.07 (3.07). **Pedipalps** elongate with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–47.5 (47.5) long); femur (96.25–

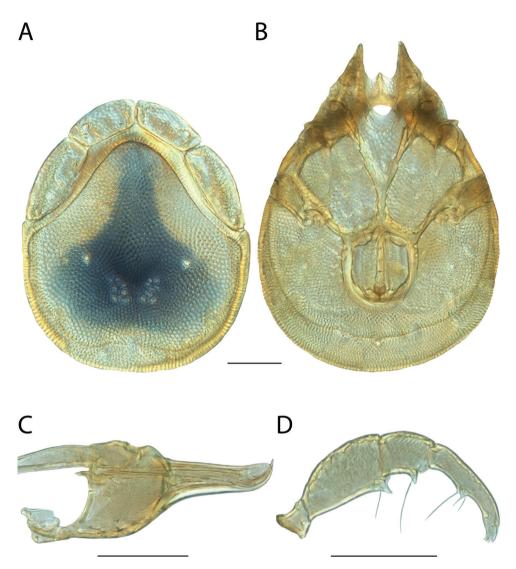

Figure 89. *Torrenticola gnoma* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

103.75 (103.75) long); genu (52.5–57.5 (57.5) long); tibia (77.5–90 (88.75) long; 20–22.5 (20) wide); tarsus (17.5–20 (18.75) long). Palpomere proportions: femur/genu 1.72–1.83 (1.80); tibia/femur 0.81–0.91 (0.86); tibia length/width 3.88–4.44 (4.44).

Venter — (560–590 (581) long; 354–440 (395) wide) colorless. Gnathosomal bay (105–130 (127.5) long; 62.5–77.5 (62.5) wide). Cxgl-4 subapical. **Medial suture** (67.5–80 (70) long). **Genital plates** (122.5–135 (127.5) long; 100–110 (105) wide). Additional measurements: Cx-1 (217–269 (255) long (total); 90–119 (115) long (medial)); Cx-3 (264–312 (295) wide); anterior venter (197.5–222.5 (207.5)

long). Ventral proportions: gnathosomal bay length/width 1.40–2.04 (2.04); anterior venter/genital field length 1.49–1.65 (1.63); anterior venter length/genital field width 1.80–2.12 (1.98); anterior venter/medial suture 2.53–2.96 (2.96).

IMMATURES unknown.

Etymology. Specific epithet (*gnoma*) refers to the dorsal pattern, which, although variable, resembles the head and cap of a gnome (*gnoma*, L. diminutive fabled being, dwarf).

Distribution. Eastern, but apparently absent from Appalachians and Northeast (Figure 87).

Remarks. Torrenticola gnoma groups with other members of the Raptor Complex with high support and specimens of this species were less than 1% different in COI sequence from each other. In the combined analysis, *T. gnoma* groups with *T. irapalpa* with high support, but the position of this clade was not recovered. These species are greater than 9% from each other. Based upon overall similarity, distribution, and phylogenetic position, this species is placed within the Raptor Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola gorti Fisher & Dowling, sp. n. http://zoobank.org/68090171-7471-45F7-92EC-98FEFA289568

Material examined. HOLOTYPE (\bigcirc): from Canada, New Brunswick, York County, Davis Brook, beside Hwy 3, 3.5 km south of Hwy 4 at Thomaston Corner, 11 Jun 2012, by IM Smith, IMS120017, DNA 2970.

PARATYPES (24 \bigcirc ; 22 \bigcirc): Alabama, USA: 1 \bigcirc and 1 \bigcirc from Cleburne County, beside Route 431, 3.3 kilometers southeast of Calhoun, Jackson Creek (33°36'N, 85°42′W), 2 Jul 1990, by IM Smith, IMS900074 • 2 ♀ and 1 ♂ from DeKalb County, Desoto State Park, beside Trail Y, West Fork of Little River (34°29'N, 85°32'W), 26 Sep 1992, by IM Smith, IMS920053A • Georgia, USA: 2 \bigcirc and 2 \bigcirc from Chattooga County, Cloudland, beside Route 48, East Fork of Little River (34°31'25"N, 85°30'23"W), 28 Sep 1992, by IM Smith, IMS920056A • 4 ♀ and 1 ♂ from Floyd County, Johns Creek, beside road from Everett Springs to Villanow, south of The Pocket campground, 4 Jul 1990, by IM Smith, IMS900076 & IMS900077 • Kentucky, **USA:** $3 \stackrel{\bigcirc}{\rightarrow}$ and $2 \stackrel{\bigcirc}{\rightarrow}$ from McCreary County, Rock Creek, White Oak Junction, beside Forest Route 556, south of Route 1363, 8 Jul 1990, by IM Smith, IMS900082A & IMS900082B • Maine, USA: 2 \bigcirc and 3 \bigcirc from Aroostook County, Ashland, beside Route 11 at bridge, Aroostook River (46°38'N, 68°24'W), 4 Jul 1989, by IM Smith, IMS890067 • New Brunswick, Canada: 1 d (ALLOTYPE) from York County, Davis Brook, beside Hwy 3, 3.5 km south of Hwy 4 at Thomaston Corner, 11 Jun 2012, by IM Smith, IMS120017, DNA 2972 • 2 \bigcirc and 2 \bigcirc from York County, Davis Brook, beside Hwy 3, 3.5 km south of Hwy 4 at Thomaston Corner, 11 Jun 2012, by IM Smith, IMS120017 • 1 2 and 1 3 from York County, Magaguadavic River, beside

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and most paratypes $(19 \bigcirc; 16 \bigcirc)$ deposited in the CNC; other paratypes $(5 \heartsuit; 5 \bigcirc)$ deposited in the ACUA.

Diagnosis. Torrenticola gorti specimens from Tellico River system in Monroe County (Tennessee) can be differentiated from all other Torrenticola by the distinctively dark coloration with a red spot dorsally. Other color morphs are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba and T. shubini), Neoanomala Group (T. interiorensis and T. neoanomala), and T. bondi, T. elongata, T. reduncarostra, T. erectirostra, T. robisoni, T. irapalpa, T. racupalpa, T. skvarlai, and T. arktonyx. They can be differentiated from Rusetria 4-Plates and T. skvarlai by having distinct hind

coxal margins. T. gorti can be differentiated from T. erectirostra, T. robisoni, and T. reduncarostra by having a straight, anteriorly-directed rostrum (upturned in others). T. gorti can be differentiated from T. arktonyx by having an unmodified dorsal plate (*T. arktonyx* has distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly). T. gorti can be differentiated from T. racupalpa and *T. irapalpa* by being more elongate (dorsum length/width = 1.47-1.6 in *T. gorti*, 1.15-1.3 in others) and tibia/femur (0.65-0.73 in T. gorti, 0.77-0.91 in others). T. gorti can be differentiated from *T. elongata* by having a more ovoid dorsum (length/width = 1.47–1.58 in T. gorti, 1.7–2.1 in T. elongata) and larger dorsum (length Q = 570-600in *T. gorti*, 540–565 in *T. elongata*; $\mathcal{J} = 500-525$ in *T. gorti*, 450–460 in *T. elongata*). T. gorti can be differentiated from the Neoanomala Group by having a more elongate dorsum (length/width Q = 1.47 - 1.58 in *T. gorti*, 1.29 - 1.43 in Neoanomala Group; \mathcal{J} = 1.54–1.58 in *T. gorti*, 1.34–1.50 in Neoanomala Group) and having a more elongate rostrum (length/width = 3.29–3.73 in *T. gorti*, 2.59–2.90 in Neoanomala Group). *T.* gorti can be differentiated from T. bondi by having a more elongate dorsum (length/ width = 1.47-1.58 in T. gorti, 1.32-1.45 in T. bondi) and having a more elongate rostrum (length/width = 3.32–3.73 in *T. gorti*, 2.76–3.13 in *T. bondi*).

Description. FEMALE (Figure 91) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (570–600 (600) long; 380–390 (380) wide) ovoid and elongate with three distinct color morphs: 1) navy blue coloration separated into anterior and posterior portions that meet or nearly meet laterally, and with bold orange coloration in between, from Tellico River, Monroe County, Tennessee; 2) purple coloration separated into anterior and posterior portions with a strip of bold orange medially. Anterio-medial platelets (117.5–137.5 (130) long; 52.5–57.5 (57.5) wide). Anterio-lateral platelets (162.5–172.5 (172.5) long; 55–60 (60) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 220–260 (260)). Dorsal plate proportions: dorsum length/width 1.47–1.58 (1.58); dorsal width/distance between Dgl-4 1.46–1.73 (1.46); anterio-medial platelet length/width 2.24–2.45 (2.26); anterio-lateral platelet length/width 2.75–3.09 (2.88); anterio-lateral/anterio-medial length 1.20–1.45 (1.33).

Gnathosoma — **Subcapitulum** (327.5–342.5 (337.5) long (ventral); 247.75–265 (252.5) long (dorsal); 122.5–127.5 (122.5) tall) colorless. Rostrum (137.5–142.5 (142.5) long; 37.5–42.5 (40) wide) elongate. Chelicerae 330–345 (340) long) with curved fangs (56–60 (60) long). Subcapitular proportions: ventral length/height 2.59–2.76 (2.76); rostrum length/width 3.32–3.73 (3.56). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–45 (45) long); femur (117.5–123.75 (120) long); genu (62.5–67.5 (67.5) long); tibia (77.5–82.5 (80) long; 20–25 (25) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.78–1.90 (1.78); tibia/femur 0.65–0.68 (0.67); tibia length/width 3.20–4.13 (3.20).

Venter (Figure 57) — $(695-750 \ (750) \ \text{long}; 410-494 \ (430) \ \text{wide})$ with three distinct color morphs: 1) navy-blue coloration; 2) colorless; 3) purple coloration. Gnathosomal bay (142.5–172.5 (172.5) long; 65–77.5 (70) wide). Cxgl-4 subapical. **Me**-

MALE (Figure 92) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (500–525 (520) long; 320–340 (330) wide) ovoid and elongate with three distinct color morphs: 1) navy blue coloration separated into anterior and posterior portions that meet or nearly meet laterally, and with bold orange coloration in between; 2) purple coloration separated into anterior and posterior portions; 3) purple coloration separated into anterior separated into anterior portions with a strip of bold orange

medially. Anterio-medial platelets (108.75–117.5 (115) long; 47.5–57.5 (50) wide). Anterio-lateral platelets (156.25–165 (157.5) long; 52.5–57.5 (53.75) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 210–230 (230)). Dorsal plate proportions: dorsum length/width 1.54–1.58 (1.58); dorsal width/distance between Dgl-4 1.43–1.58 (1.43); anterio-medial platelet length/width 2.04–2.35 (2.30); anterio-lateral platelet length/width 2.78–2.98 (2.93); anterio-lateral/anterio-medial length 1.36–1.44 (1.37).

Gnathosoma — **Subcapitulum** (280–292.5 (282.5) long (ventral); 211–231 (215) long (dorsal); 92.5–1.5 (95) tall) colorless. Rostrum (115–127.5 (122.5) long; 33.75–37.5 (35) wide) elongate. Chelicerae (275–302 (280) long) with curved fangs (36–50 (50) long). Subcapitular proportions: ventral length/height 2.76–3.16 (2.97); rostrum length/width 3.29–3.50 (3.50). Pedipalps with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–37.5 (35) long); femur (87.5–105 (95) long); genu (52.5–58.75 (56.25) long); tibia (62.5–72.5 (67.5) long; 18.75–22.5 (18.75) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.67–1.79 (1.69); tibia/femur 0.67–0.73 (0.71); tibia length/width 3.13–3.63 (3.60).

Venter — (630–680 (640) long; 380–438 (380) wide) with three distinct color morphs: 1) navy-blue coloration; 2) colorless; 3) purple coloration. Gnathosomal bay (122.5–142.5 (142.5) long; 60–67.5 (60) wide). Cxgl-4 subapical. **Medial suture** (62.5–87.5 (65) long). **Genital plates** (125–135 (135) long; 102.5–111.25 (102.5) wide). Additional measurements: Cx-1 (255–280 (280) long (total); 100–140 (140) long (medial)); Cx-3 (285–304 (290) wide); anterior venter (215–250 (215) long). Ventral proportions: gnathosomal bay length/width 1.89–2.38 (2.38); anterior venter/ genital field length 1.59–1.89 (1.59); anterior venter length/genital field width 1.96–2.27 (2.10); anterior venter/medial suture 2.86–3.48 (3.31).

IMMATURES unknown.

Etymology. Specific epithet (*gorti*) refers to Gort, the fictional giant robot of *The Day the Earth Stood Still*. In the 2008 film, Gort was depicted with a dark body and a single red eye that shot a destructive beam. This species is named for the resemblance that the distinctive specimens from Tennessee have to Gort's red eye.

Distribution. Appalachians (Figure 90).

Remarks. Torrenticola gorti groups with other members of the Raptor Complex with high support and specimens of this species were less than 1% different in COI sequence from each other. In all analyses, *T. elongata* groups with two other species (*T. elongata* and *T. bondi*) which are 4% different from each other and have non-overlapping ranges.

T. elongata to form the Elongata Group in all analyses with high support.

Based upon overall similarity, an elongate body, and distribution, we place this species in the Elongata Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Members of this species can be highly variable in color. Some members have reddish-purple or purple dorsal coloration that is separated into anterior and posterior portions. Ventral coloration can be bold, faint, or absent. Members from Tellico River, Monroe County (Tennessee), can be readily differentiated from all other *Torrenticola* by being dark navy blue with a red dorsal oval.

Torrenticola hoosieri Fisher & Dowling, sp. n. http://zoobank.org/F64DDF23-2E2B-45EC-980E-06E07A3EEE0B

Material examined. HOLOTYPE (\bigcirc): from USA, Indiana, Wayne County, south of I-70 (39°51'13"N, 85°8'4"W), 31 Jul 2014, by MJ Skvarla, MS 14-0731-001.

PARATYPES (1 \bigcirc ; 5 \eth): **Indiana:** 1 \eth (ALLOTYPE) from Wayne County, south of I-70 (39°51'13"N, 85°8'4"W), 31 Jul 2014, by MJ Skvarla, MS 14-0731-001 • 1 \bigcirc and 4 \eth from Wayne County, south of I-70 (39°51'13"N, 85°8'4"W), 31 Jul 2014, by MJ Skvarla, MS 14-0731-001.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(3 \circlearrowright)$ deposited in the CNC; other paratypes $(1 \heartsuit; 2 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola hoosieri are similar to other members of the Tricolor Complex (*T. bittikoferae*, *T. larvata*, *T. pearsoni*, *T. olliei*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, and *T. unimaculata*, *T. cardia*, *T. kringi*, *T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. hoosieri* can be differentiated from all other Tricolor Complex, and nearly all other *Torrenticola*, by lacking pedipalp ventral extensions on femora and genua. Additionally, *T. hoosieri* can be differentiated from all other Tricolor Complex by having more elongate pedipalp tibiae (3.67–4.33 in *T. hoosieri*, 2.65–3.55 in others) and by being colorless (rarely with diffuse pink dorsal coloration), except *T. bittikoferae*, *T. pearsoni*, and *T. dimorpha*.

Description. FEMALE (Figure 94) (n = 2) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (650–700 (650) long; 450–470 (450) wide) ellipsoid and colorless, occasionally with pink coloration without a distinct pattern. Anterio-medial platelets (115–125 (115) long; 55–60 (55) wide). Anterio-lateral platelets (177.5–180 (177.5) long; 67.5–67.5 (67.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 345–375 (345)). Dorsal plate proportions: dorsum length/width 1.44–1.49 (1.44); dorsal width/distance between Dgl-4 1.25–1.30 (1.30); anterio-medial platelet length/width 2.08–2.09 (2.09); anterio-lateral platelet length/width 2.63–2.67 (2.63); anterio-lateral/anterio-medial length 1.44–1.54 (1.54).

Gnathosoma — **Subcapitulum** (277.5–300 (277.5) long (ventral); 202.5–221.23 (202.5) long (dorsal); 127.5–138.75 (127.5) tall) colorless. Rostrum (120–132.5 (120) long; 52.5–55 (52.5) wide) short and conical. Chelicerae (260–291 (260) long) with curved fangs (75–77 (75) long). Subcapitular proportions: ventral length/height 2.16–2.18 (2.18); rostrum length/width 2.29–2.41 (2.29). **Pedipalps** without extensions on femora and genua. Palpomeres: trochanter (50–55 (50) long); femur (130–137.5 (130)

Figure 93. Torrenticola hoosieri sp. n. distribution.

long); genu (72.5–80 (72.5) long); tibia (102.5–110 (102.5) long; 27.5–30 (27.5) wide); tarsus (25–27.5 (27.5) long). Palpomere proportions: femur/genu 1.72–1.79 (1.79); tibia/femur 0.79–0.80 (0.79); tibia length/width 3.67–3.73 (3.73).

Venter — (790–800 (800) long; 480–551 (480) wide) colorless. Gnathosomal bay (122.5–130 (130) long; 85–105 (85) wide). Cxgl-4 subapical. **Medial suture** (30–30 (30) long). **Genital plates** (182.5–188.75 (188.75) long; 150–152.5 (150) wide). Additional measurements: Cx-1 (257–260 (260) long (total); 120–129 (120) long (medial)); Cx-3 (330–390 (330) wide); anterior venter (162.5–167.5 (162.5) long). Ventral proportions: gnathosomal bay length/width 1.17–1.53 (1.53); anterior venter/genital field length 0.86–0.92 (0.86); anterior venter length/genital field width 1.08–1.10 (1.08); anterior venter/medial suture 5.42–5.58 (5.42).

MALE (Figure 95) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (580–640 (640) long; 390–410 (400) wide) ellipsoid and colorless. Anterio-medial platelets (110–117.5 (115) long; 55–60 (60) wide). Anterio-lateral platelets (167.5–175 (175) long; 65–72.5 (70) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–360 (325)). Dorsal plate proportions: dorsum length/width 1.43–1.60 (1.60); dorsal width/distance between Dgl-4 1.14–1.23 (1.23); anterio-medial platelet length/width 1.91–2.05 (1.92); anterio-lateral platelet length/width 2.31–2.58 (2.50); anterio-lateral/anterio-medial length 1.43–1.59 (1.52).

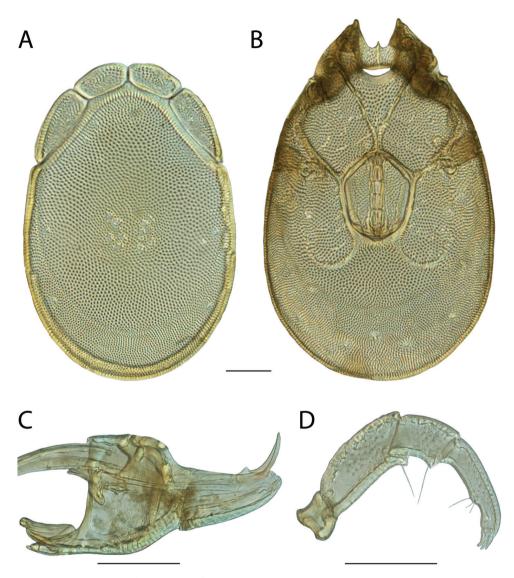

Figure 94. *Torrenticola hoosieri* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum, note damaged rostrum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Gnathosoma — **Subcapitulum** (245–280 (280) long (ventral); 185–202.5 (200) long (dorsal); 107.5–120 (120) tall) colorless. Rostrum (107.5–110 (110) long; 42.5–45 (45) wide). Chelicerae (245–260 (260) long) with curved fangs (65–70 (67.5) long). Subcapitular proportions: ventral length/height 2.23–2.36 (2.33); rostrum length/width 2.44–2.59 (2.44). **Pedipalps** without extensions on femora and genua. Palpomeres: trochanter (37.5–47.5 (45) long); femur (117.5–125 (125) long); genu (70–75 (75) long); tibia (97.5–100 (100) long; 22.5–25 (25) wide); tarsus (22.5–27.5)

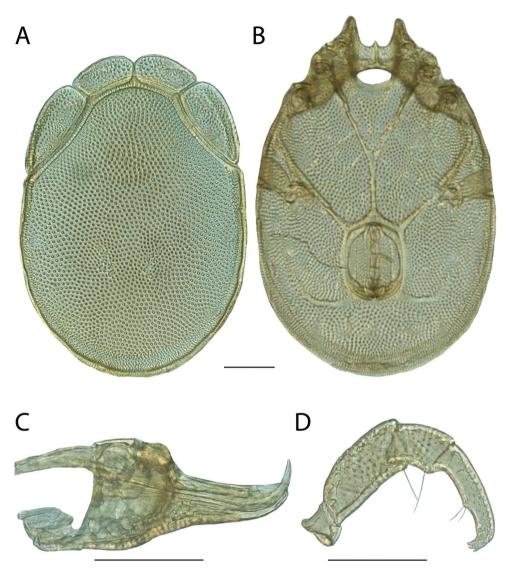

Figure 95. *Torrenticola hoosieri* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

(27.5) long). Palpomere proportions: femur/genu 1.67–1.73 (1.67); tibia/femur 0.79–0.83 (0.80); tibia length/width 3.90–4.33 (4.00).

Venter — (670–740 (740) long; 450–495 (460) wide) colorless. Gnathosomal bay (120–130 (125) long; 80–85 (85) wide). Cxgl-4 subapical. **Medial suture** (102.5–122.5 (117.5) long). **Genital plates** (140–150 (147.5) long; 102.5–110 (105) wide). Additional measurements: Cx-1 (240–260 (260) long (total); 120–150 (130) long (medial)); Cx-3 (330–350 (345) wide); anterior venter (237.5–270 (270) long). Ven-

tral proportions: gnathosomal bay length/width 1.47–1.59 (1.47); anterior venter/ genital field length 1.70–1.84 (1.83); anterior venter length/genital field width 2.21– 2.57 (2.57); anterior venter/medial suture 2.14–2.51 (2.30).

IMMATURES unknown.

Etymology. Specific epithet (*hoosieri*) refers to Hoosier, the English demonym for a person from Indiana, the type locality.

Distribution. Known only from Wayne County, Indiana (Figure 93).

Remarks. Torrenticola hoosieri group with other members of the Tricolor Complex with high support and all specimens are less than 1% different in COI sequence from each other. In the combined analysis, *T. hoosieri* groups with other members of the Tricolor Complex from eastern North America that are not colorful, *T. projector* and *T. pearsoni*, and are greater than 4% different in COI from these species. This species is placed in the Tricolor Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%), high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola indistincta (Marshall, 1929)

Atractides indistinctus Marshall, 1929: 317.

T. indistincta: Mitchell 1954: 40 • Viets 1956: 253 • Crowell 1960: 35, 37 • Crowell 1961: 330 • Habeeb 1967: 3 • Weaver 1967: 223 • Conroy 1968: 28 • Young 1969: 373-386 • Modlin and Gannon 1973: 219, 221 • Conroy and Scudder 1975: 307.

Material examined. LECTOTYPE $(1 \)$: from USA, Wisconsin, Green Lake County, Green Lake, Aug 1921, by C Juday, RM210013.

Type deposition. Types $(1 \, \bigcirc, 1 \, \circlearrowright)$; and most other material $(3 \, \bigcirc; 2 \, \circlearrowright)$ deposited in the CNC; other paratypes $(2 \, \bigcirc; 2 \, \circlearrowright)$ deposited in the ACUA.

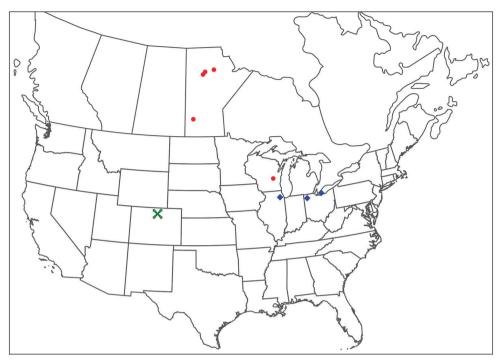

Figure 96. *Torrenticola indistincta* distribution. Red dots indicate material examined. Blue diamonds indicate previously published reports. Green "X" indicates previously published report (Young 1969) that requires verification of identification.

Diagnosis. Torrenticola indistincta are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. malarkeyorum, T. pen-dula, T. sellersorum, T. tysoni, T. ululata, T. whitneyae, T. microbiscutella*, and *T. feminel-lai*) in having anterio-lateral platelets fused to the dorsal plate, and being distributed in the east. *T. indistincta* can be differentiated from other Eastern 2-Plates by having faint coloration separated into anterior and posterior portions connected medially. Female *T. indistincta* can be differentiated from female *T. caerulea* by having a larger genital field (length = 185–225 in *T. indistincta*, 155–165 in *T. caerulea*; width = 185–205 in *T. indistincta*, 120–145 in *T. caerulea*). Male *T. indistincta* can be differentiated from male *T. caerulea*; width = 315–470 in *T. indistincta*, 260–305 in *T. caerulea*). *T. indistincta* can be differentiated from *T. microbiscutella* by having a less elongate dorsum (length = 1.21–1.52 in *T. indistincta*; 1.63–1.75 in *T. microbiscutella*).

Re-description. FEMALE (Figure 97) (n = 5) (lectotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–880 (640) long; 460–720 (485) wide) ovoid with faint coloration separated into anterior and posterior portions and connected medially. Anteriomedial platelets (125–195 (125) long; 45–77.5 (47.5) wide). Anterio-lateral platelets (172.5–235 (172.5) long; 75–115 (80) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 340–485 (340)). Dorsal plate proportions: dorsum length/width 1.21–1.32 (1.32); dorsal width/distance between Dgl-4 1.32–1.48 (1.43); anterio-medial platelet length/width 2.35–2.94 (2.63); anterio-lateral platelet length/width 2.02–2.33 (2.16); anterio-lateral/anterio-medial length 1.19–1.38 (1.38).

Gnathosoma — **Subcapitulum** (300–395 (322.5) long (ventral); 225–295 (237.5) long (dorsal); 145–195 (150) tall) tall and colorless. Rostrum (120–160 (125) long; 45–62.5 (47.5) wide). Chelicerae (300–405 (335) long) with curved fangs (60–80 (62.5) long). Subcapitular proportions: ventral length/height 1.97–2.15 (2.15); rostrum length/width 2.50–2.78 (2.63). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–65 (47.5) long); femur (112.5–160 (117.5) long); genu (62.5–90 (62.5) long); tibia (87.5–122.5 (87.5) long; 25–31.25 (25) wide); tarsus (17.5–30 (17.5) long). Palpomere proportions: femur/genu 1.67–1.88 (1.88); tibia/femur 0.74–0.80 (0.74); tibia length/width 3.50–3.92 (3.50).

Venter — (650–995 (800) long; 535–880 (565) wide) colorless. Gnathosomal bay (175–237.5 (175) long; 90–130 (97.5) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (185–225 (205) long; 185–205 (190) wide). Additional measurements: Cx-1 (295–385 (305) long (total); 120–155 (135) long (medial)); Cx-3 (345–505 (345) wide); anterior venter (125–167.5 (135) long). Ventral proportions: gnathosomal bay length/width 1.79–2.02 (1.79); anterior venter/genital field length 0.66–0.83 (0.66); anterior venter length/genital field width 0.66–0.83 (0.71).

MALE (Figure 98) (n = 5) (lectotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (480–645 (480) long; 315–470 (315) wide) ovoid with faint coloration separated into anterior and posterior portions and connected medially. Anteriomedial platelets (102.5–147.5 (102.5) long; 35–55 (35) wide). Anterio-lateral platelets (137.5–180 (150) long; 55–82.5 (55) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 235– 350 (235)). Dorsal plate proportions: dorsum length/width 1.37–1.52 (1.52); dorsal width/distance between Dgl-4 1.31–1.34 (1.34); anterio-medial platelet length/width 2.33–3.05 (2.93); anterio-lateral platelet length/width 2.12–2.73 (2.73); anterio-lateral platelet eral/anterio-medial length 1.19–1.46 (1.46).

Gnathosoma — **Subcapitulum** (238.75–317.5 (238.75) long (ventral); 167.5–232.5 (167.5) long (dorsal); 102.5–137.5 (102.5) tall) tall and colorless. Rostrum (85–125 (85) long; 32.5–50 (32.5) wide). Chelicerae (232.5–320 (232.5) long) with curved fangs (47.5–65 (47.5) long). Subcapitular proportions: ventral length/height 2.22–2.33 (2.33); rostrum length/width 2.50–2.86 (2.62). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–52.5 (37.5) long); femur (86.25–117.5 (86.25) long); genu (50–77.5 (50) long); tibia (70–100 (70) long; 22.5–28.75 (22.5) wide); tarsus (17.5–22.5 (17.5) long). Palpomere proportions: femur/genu 1.52–1.73 (1.73); tibia/femur 0.80–0.85 (0.81); tibia length/width 3.11–3.48 (3.11).

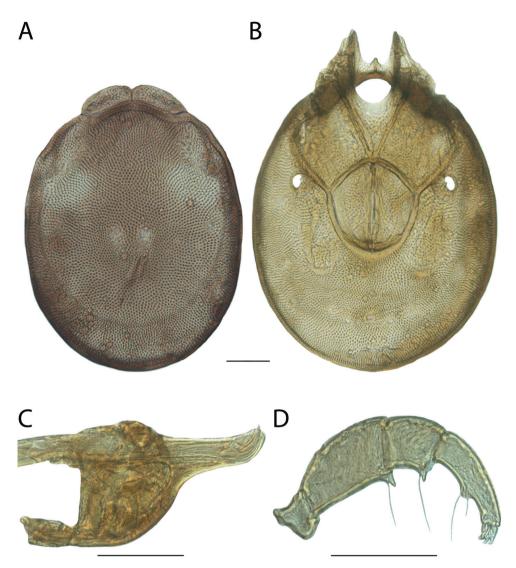

Figure 97. *Torrenticola indistincta* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Venter — (570–780 (570) long; 370–510 (370) wide) colorless. Gnathosomal bay (127.5–180 (127.5) long; 65–100 (65) wide). Cxgl-4 subapical. **Medial suture** (65–75 (75) long). **Genital plates** (117.5–165 (117.5) long; 112.5–150 (112.5) wide). Additional measurements: Cx-1 (235–315 (235) long (total); 107.5–150 (107.5) long (medial)); Cx-3 (250–395 (277.5) wide); anterior venter (190–235 (190) long). Ventral proportions: gnathosomal bay length/width 1.80–1.96 (1.96); anterior venter/genital field length 1.38–1.68 (1.62); anterior venter length/genital field width 1.53–1.69 (1.69); anterior venter/medial suture 2.53–3.54 (2.53).

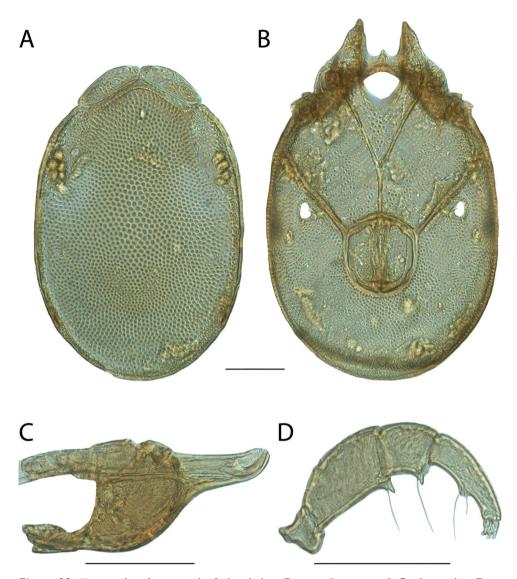

Figure 98. *Torrenticola indistincta* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

IMMATURES unknown.

Etymology. Marshall (1929) named the specific epithet (*indistincta*) in reference to the Rusetria Complex character of fused ("indistinct") lateral platelets.

Distribution. Midwest and into Manitoba (Figure 96). Young (1969) reported this species from Colorado, but this likely represents *T. mulleni* rather than *T. indistincta*.

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola indistincta* and therefore this species was not included in our phylogenetic analyses. However, we were able to examine type material and additional material preserved in

GAW. The fusion of the lateral platelets to the dorsal plate clearly places this species among the Rusetria Complex and its distribution is consistent with placement within the Eastern 2-Plate Identification Group.

Although Young (1969) reported this species in Colorado, we suspect that record represents the superficially similar *T. mulleni* based upon distribution.

Torrenticola interiorensis Fisher & Dowling, sp. n. http://zoobank.org/A334B365-1656-4A67-8D6F-82013B6A3F74

Material examined. HOLOTYPE (♂): from USA, Arkansas, Montgomery County, Caddo Gap, access track off Manfred Road, 0.3 km west of Route 8, 29 Jul 2011, by IM Smith, IMS110037.

PARATYPES (7 \bigcirc ; 11 \bigcirc): **Arkansas, USA**: 1 \bigcirc (ALLOTYPE) from Montgomery County, Caddo Gap, access track off Manfred Road, 0.3 km west of Route 8, 29 Jul 2011, by IM Smith, IMS110037 • 2 \bigcirc from Montgomery County, Caddo Gap, access track off Manfred Road, 0.3 km west of Route 8, 29 Jul 2011, by IM Smith, IMS110037 • 1 \bigcirc and 1 \bigcirc from Newton County, Ozark-St. Francis National Forest, Little Buffalo River, 11 Jul 2012, by TD Edwards, TDE 12-0711-004 • **Missouri, USA**: 3 \bigcirc and 5 \bigcirc from Crawford County, Huzzah Creek, Red Bluff campground, off Road V, east of Davisville, 23 Jul 2011, by IM Smith, IMS110029 • **Oklahoma, USA**: 2 \bigcirc and 3 \bigcirc from Pushmataha County, Walnut Creek, beside Route 271, south of Albion, 1 Jul 1987, by IM Smith, IMS870063A.

Type deposition. Holotype (\eth), allotype (\updownarrow), and some paratypes (5 \heartsuit ; 5 \eth) deposited in the CNC; other paratypes (2 \heartsuit ; 5 \eth) deposited in the ACUA.

Diagnosis. Torrenticola interiorensis are similar to species with similar dorsal patterning, such as the Rusetria 4-Plate Group (T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba and T. shubini), Elongata Group (T. gorti, T. elongata, and T. reduncarostra), and T. bondi, T. erectirostra, T. robisoni, T. irapalpa, T. neoanomala, T. racupalpa, T. skvarlai, and T. arktonyx. They can be differentiated from Rusetria 4-Plates and T. skvarlai by having distinct hind coxal margins. T. interiorensis can be differentiated from T. erectirostra, T. robisoni and T. reduncarostra by having a straight, anteriorlydirected rostrum (upturned in T. erectirostra and T. reduncarostra). T. interiorensis can be differentiated from T. arktonyx by having an unmodified dorsal plate (T. arktonyx has distinctive longitudinal dark markings on the anterior portion of the dorsal plate). T. interiorensis can be differentiated from T. racupalpa by having less elongate pedipalpal tibiae (length/width = 3.76-4.22 in T. interiorensis; 4.44-5.50 in T. racupalpa) and less elongate rostrum (length/width = 2.63-2.88 in T. interiorensis; 3.56-3.88 in T. racupalpa). T. interiorensis can be differentiated from T. irapalpa by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 \bigcirc = 1.48–1.61 in *T. interiorensis*, 1.81–2.09 in *T. irapalpa*; $\mathcal{J} = 1.42–1.45$ in *T. interiorensis*, 1.58–1.86 in *T. irapalpa*) and more ovoid dorsum (length/width Q = 1.29 - 1.38 in *T. interiorensis*, 1.20 - 1.28 in *T.* irapalpa; 🗟 = 1.34–1.47 in T. interiorensis, 1.26–1.30 in T. irapalpa). T. interiorensis can

Figure 99. Torrenticola interiorensis sp. n. distribution.

be differentiated from Elongata Group by being slightly more ovoid (dorsum length/ width Q = 1.29-1.38 in *T. interiorensis*, 1.45–2.08 in Elongata Group; $\mathcal{F} = 1.34-1.47$ in *T. interiorensis*, 1.51–1.7 in Elongata Group) and having a stockier rostrum (length/ width = 2.63–2.88 in *T. interiorensis*, 3.24–4.00 in Elongata Group). *T. interiorensis* can be differentiated from *T. bondi* by having a longer medial suture (Q = 25-30 in *T. interiorensis*, 10–15 in *T. bondi*; $\mathcal{F} = 75-83$ in *T. interiorensis*, 55–70 in *T. bondi*), anterior venter/genital field width (Q = 1.31-1.38 in *T. interiorensis*, 1.15–1.25 in *T. bondi*; $\mathcal{F} =$ 2.09–2.27 in *T. interiorensis*, 1.95–2.05 in *T. bondi*), and Dgl-4 closer to edge of dorsum (dorsum width/distance between Dgl-4 Q = 1.48-1.61 in *T. interiorensis*, 1.63–1.72 in *T. bondi*; $\mathcal{F} = 1.42-1.45$ in *T. interiorensis*, 1.48–1.62 in *T. bondi*). Female *T. interiorensis* can be differentiated from female *T. neoanomala* by having stockier anteriolateral platelets (length/width = 2.62–2.67 in *T. interiorensis*, 2.86–3.09 in *T. neoanomala*). Male *T. interiorensis* can be differentiated from male *T. neoanomala* by having a shorter anterior venter (220–240 in *T. interiorensis*, 267.5–290 in *T. neoanomala*) and a shorter genital field (132–138 in *T. interiorensis*, 145–160 in *T. neoanomala*).

Description. MALE (Figure 100) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (510–545 (510) long; 350–405 (360) wide) ovoid with purple coloration separated into anterior and posterior portions and orange medially. Anteriomedial platelets (115–122.5 (115) long; 45–50 (45) wide). Anterio-lateral platelets

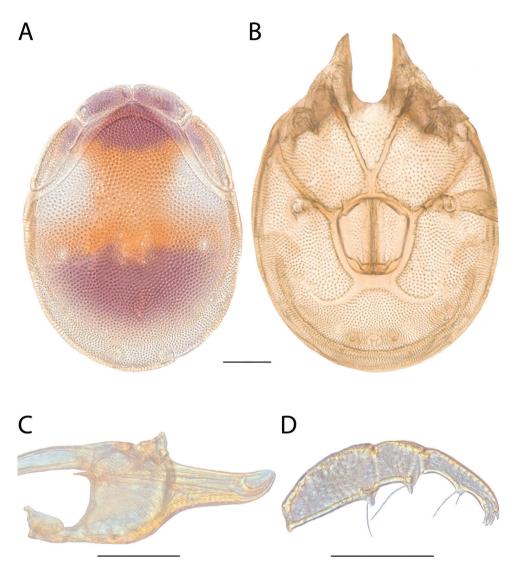

Figure 100. *Torrenticola interiorensis* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

(150–167.5 (150) long; 50–52.5 (50) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 245–285 (250)). Dorsal plate proportions: dorsum length/width 1.34–1.47 (1.42); dorsal width/distance between Dgl-4 1.42–1.45 (1.44); anterio-medial platelet length/width 2.45–2.72 (2.56); anterio-lateral platelet length/width 3.00–3.19 (3.00); anterio-lateral/ anterio-medial length 1.30–1.37 (1.30).

Gnathosoma — Subcapitulum (265–282.5 (265) long (ventral); 200–212 (200) long (dorsal); 105–112.5 (105) tall) colorless. Rostrum (112.5–115 (112.5) long; 40–

40 (40) wide). Chelicerae (260–282 (260) long) with curved fangs (45–58 (45) long). Subcapitular proportions: ventral length/height 2.51–2.60 (2.52); rostrum length/ width 2.81–2.88 (2.81). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (32.5–37.5 (32.5) long); femur (97.5–105 (97.5) long); genu (55–62.5 (55) long); tibia (77.5–81.25 (77.5) long; 20–21.25 (20) wide); tarsus (17.5–18.75 (17.5) long). Palpomere proportions: femur/genu 1.68–1.78 (1.77); tibia/femur 0.77–0.79 (0.79); tibia length/width 3.76–3.88 (3.88).

Venter — (608–660 (640) long; 424–480 (480) wide) mostly colorless with faint purple in areas surrounding coxae. Gnathosomal bay (102.5–137.5 (110) long; 65–85 (75) wide). Cxgl-4 subapical. **Medial suture** (75–82.5 (75) long). **Genital plates** (132.5–137.5 (132.5) long; 100–107.5 (100) wide). Additional measurements: Cx-1 (231–270 (260) long (total); 123.25–134 (130) long (medial)); Cx-3 (300–338 (315) wide); anterior venter (220–240 (220) long). Ventral proportions: gnathosomal bay length/width 1.37–2.12 (1.47); anterior venter/genital field length 1.60–1.80 (1.66); anterior venter length/genital field width 2.09–2.27 (2.20); anterior venter/medial suture 2.73–2.98 (2.93).

FEMALE (Figure 101) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–620 (550) long; 410–480 (415) wide) ovoid with purple coloration separated into anterior and posterior portions and orange coloration. Anterio-medial platelets (123.75–142.5 (123.75) long; 50–60 (50) wide). Anterio-lateral platelets (160–187.5 (160) long; 60–70 (60) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 255–305 (280)). Dorsal plate proportions: dorsum length/width 1.29–1.38 (1.33); dorsal width/distance between Dgl-4 1.48–1.61 (1.48); anterio-medial platelet length/width 2.36–2.52 (2.48); anterio-lateral platelet length/width 2.62–2.68 (2.67); anterio-lateral/anterio-medial length 1.21–1.33 (1.29).

Gnathosoma — **Subcapitulum** (307.5–325 (310) long (ventral); 220–240 (232.5) long (dorsal); 120–130 (120) tall) colorless. Rostrum (122.5–140 (125) long; 45–50 (45) wide). Chelicerae (300–340 (310) long) with curved fangs (50–65 (55) long). Subcapitular proportions: ventral length/height 2.44–2.58 (2.58); rostrum length/width 2.63–2.83 (2.78). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–45 (40) long); femur (112.5–127.5 (115) long); genu (65–70 (65) long); tibia (85–95 (85) long; 21.25–22.5 (21.25) wide); tarsus (17.5–22.5 (20) long). Palpomere proportions: femur/genu 1.73–1.82 (1.77); tibia/femur 0.74–0.76 (0.74); tibia length/width 3.78–4.22 (4.00).

Venter — (680–780 (680) long; 470–580 (510) wide) mostly colorless with purple in areas surrounding coxae. Gnathosomal bay (112.5–152.5 (145) long; 70–100 (90) wide). Cxgl-4 subapical. **Medial suture** (25–30 (30) long). **Genital plates** (155–175 (155) long; 137.5–152.5 (145) wide). Additional measurements: Cx-1 (242–310 (280) long (total); 125–160 (140) long (medial)); Cx-3 (320–390 (350) wide); anterior venter (190–205 (190) long). Ventral proportions: gnathosomal bay length/width 1.22–2.07

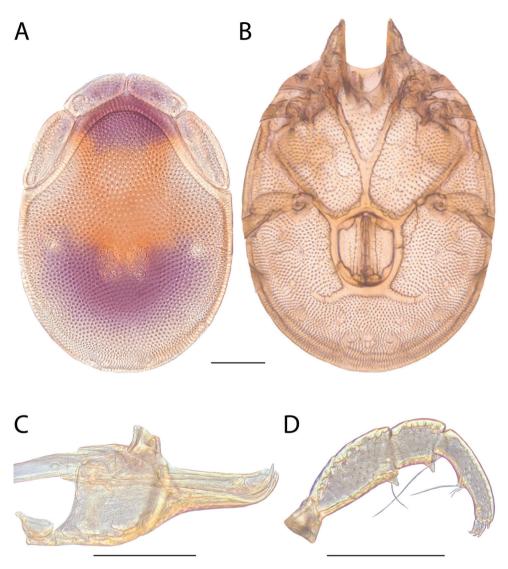

Figure 101. *Torrenticola interiorensis* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

(1.61); anterior venter/genital field length 1.17–1.23 (1.23); anterior venter length/genital field width 1.31–1.38 (1.31); anterior venter/medial suture 6.33–8.20 (6.33).

IMMATURES unknown.

Etymology. Specific epithet (*interiorensis*) refers to the Interior Highlands, where this species was found within both major regions (Ozarks and Ouachitas), but not found outside these regions, which suggests it is endemic to the region.

Distribution. Interior Highlands (Ozarks and Ouachitas), likely endemic (Figure 99).

Remarks. *Torrenticola interiorensis* groups with other members of the Raptor Complex with high support and specimens are less than 2% different in COI sequence from each other. In the combined analysis, *T. interiorensis* groups with the superficially similar *T. neoanomala*, and specimens from these species are greater than 9% different in COI sequence from each other. Based upon this relationship and their similarity, we place these species in the Neoanomala Identification Group. The Neoanomala Group shares a phylogenetic affinity for members of the similar-looking Erectirostra Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Diagnosis. Torrenticola irapalpa are similar to other members of the Raptor Group (T. gnoma, T. longitibia, T. mjolniri, T. elusiva, T. racupalpa, T. raptor, T. danielleae, T. daemon, and T. ivyae) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. T. irapalpa can be differentiated from T. longitibia, T. mjolniri, T. elusiva, T. racupalpa, and T. ivyae by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 = 1.81-2.09 in T. *irapalpa*, 2.19-2.77 in others) and a less elongate rostrum (length/width = 2.66-3.39in T. irapalpa; 3.56-4.32 in others). T. irapalpa can be differentiated from T. gnoma by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 \bigcirc = 1.81–2.09 in T. irapalpa, 2.65–3.29 in T. gnoma; \mathcal{O} = 1.58–1.86 in T. irapalpa, 2.06–2.73 in T. gnoma) and by dorsal coloration and pattern. T. irapalpa can be differentiated from T. raptor by having less elongate tibiae (length/width $\mathcal{Q} = 4.09-5.67$ in *T. irapalpa*, 6.00–7.54 in *T. raptor*; $\mathcal{J} = 4.25-4.75$ in *T. irapalpa*, 5.29–5.63 in *T.* raptor); less elongate subcapitulum (ventral length/height = 2.52-2.90 in T. irapalpa, 2.98–3.27 in T. raptor); and by dorsal pattern. T. irapalpa can be differentiated from T. danielleae by having Dgl-4 further from the dorsal edge (dorsal width/distance between Dgl-4 = Q = 1.81–2.09 in *T. irapalpa*, 1.57–1.70 in *T. danielleae*; \mathcal{J} = 1.58–1.86 in T. irapalpa, 1.42-1.52 in T. danielleae); a less elongate rostrum (length/width = 2.66-3.39 in T. irapalpa, 3.43-3.75 in T. danielleae); and by dorsal coloration and pattern. Female T. irapalpa can be differentiated from female T. daemon by having Dgl-4 further from the dorsal edge (dorsal width/distance between Dgl-4 $\stackrel{\frown}{=}$ 1.81–2.09 in T. irapalpa, 1.59-1.67 in T. daemon) and a less elongate gnathosomal bay (length/ width $\mathcal{Q} = 1.35 - 1.86$ in *T. irapalpa*, 1.95 - 2.42 in *T. daemon*). Male *T. irapalpa* can be differentiated from male *T. daemon* by dorsal coloration and pattern.

Description. FEMALE (Figure 103) (n = 9) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (575–710 (610) long; 465–580 (475) wide) circular with navy blue to bluish-purple coloration separated into anterior and posterior portions with bold orange medially. Anterio-medial platelets (132.5–160 (137.5) long; 52.5–67.5 (62.5) wide). Anterio-lateral platelets (155–197.5 (177.5) long; 67.5–87.5 (77.5) wide) free from dorsal plate. Dgl-4 midway between muscle scars and dorsum edge (distance

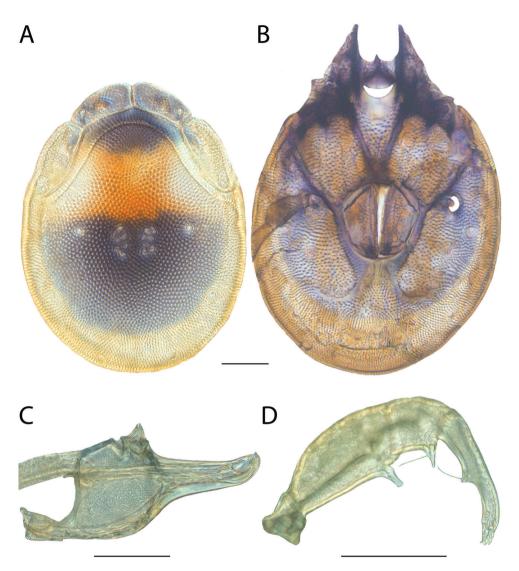

Figure 103. *Torrenticola irapalpa* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

between Dgl-4 465–580 (475)). Dorsal plate proportions: dorsum length/width 1.20–1.28 (1.28); dorsal width/distance between Dgl-4 1.81–2.09 (1.90); anteriomedial platelet length/width 2.12–2.52 (2.20); anterio-lateral platelet length/width 2.17–2.39 (2.29); anterio-lateral/anterio-medial length 1.17–1.42 (1.29).

Gnathosoma — **Subcapitulum** (300–360 (340) long (ventral); 219–270 (270) long (dorsal); 125–157.5 (145) tall) with faint navy blue to bluish-purple coloration, sometimes colorless. Rostrum (126.25–152.5 (142.5) long; 55–76 (65) wide) elongate. Chelicerae (245–360 (360) long) with curved fangs (55–75 (65) long). Sub-

capitular proportions: ventral length/height 2.29–2.57 (2.34); rostrum length/width 2.66–3.39 (3.17). **Pedipalps** elongate (especially tibiae) with long tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–52.5 (45) long); femur (115–132.5 (132.5) long); genu (65–80 (72.5) long); tibia (100–117.5 (102.5) long; 17.5–20 (20) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.66–1.89 (1.83); tibia/femur 0.77–0.89 (0.77); tibia length/width 4.09–5.67 (4.82).

Venter — (690–870 (770) long; 508–743 (550) wide) with navy blue to bluish purple coloration. Gnathosomal bay (132.5–165 (165) long; 87.5–120 (90) wide). Cxgl-4 far from apex. **Medial suture** (10–22.5 (15) long). **Genital plates** (155–175 (175) long; 140–162.5 (150) wide). Additional measurements: Cx-1 (266–334 (310) long (total); 103–156 (140) long (medial)); Cx-3 (332–487 (375) wide); anterior venter (156–197.5 (182.5) long). Ventral proportions: gnathosomal bay length/width 1.35–1.86 (1.83); anterior venter/genital field length 0.99–1.18 (1.04); anterior venter length/genital field width 1.06–1.27 (1.22); anterior venter/medial suture 8.56–15.63 (12.17).

MALE (Figure 104) (n = 8) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (520–620 (560) long; 400–490 (435) wide) circular with navy blue to bluish-purple coloration separated into anterior and posterior portions with bold orange medially. Anterio-medial platelets (115–150 (140) long; 55–67.5 (62.5) wide). Anterio-lateral platelets (160–188.75 (187.5) long; 62.5–77.5 (75) wide) free from dorsal plate. Dgl-4 midway between muscle scars and dorsum edge (distance between Dgl-4 220–310 (250)). Dorsal plate proportions: dorsum length/width 1.26–1.30 (1.29); dorsal width/distance between Dgl-41.58–1.86 (1.74); anterio-medial platelet length/width 2.00–2.48 (2.24); anterio-lateral platelet length/width 2.34–2.60 (2.50); anterio-lateral/anterio-medial length 1.22–1.41 (1.34).

Gnathosoma — **Subcapitulum** (275–340 (310) long (ventral); 207–240 (240) long (dorsal); 105–132.5 (107.5) tall) with faint navy blue to bluish-purple coloration, sometimes colorless. Rostrum (112.5–137.5 (135) long; 40–47.5 (40) wide) elongate. Chelicerae (252–305 (305) long) with curved fangs (51–60 (55) long). Subcapitular proportions: ventral length/height 2.52–2.90 (2.88); rostrum length/width 2.81–3.38 (3.38). Pedipalps elongate (especially tibiae) with long tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–50 (42.5) long); femur (107.5–123.75 (115) long); genu (60–70 (67.5) long); tibia (87.5–108.75 (95) long; 20–25 (20) wide); tarsus (18.75–20 (20) long). Palpomere proportions: femur/genu 1.70–1.83 (1.70); tibia/femur 0.81–0.91 (0.83); tibia length/width 4.25–4.75 (4.75).

Venter — $(630-705 \ (690) \ \log; 490-540 \ (500) \ wide)$ with navy blue to bluish purple coloration. Gnathosomal bay $(135-177.5 \ (146.25) \ \log; 75-95 \ (75) \ wide)$. Cxgl-4 far from apex. **Medial suture** $(50-75 \ (75) \ \log)$. **Genital plates** $(127.5-158.75 \ (143.75) \ \log; \ 100-137.5 \ (122.5) \ wide)$. Additional measurements: Cx-1 $(260-290 \ (290) \ \log \ (total); \ 137-155 \ (155) \ \log \ (medial)); \ Cx-3 \ (323-360 \ (345) \ wide); \ anterior venter (215-255 \ (245) \ \log). Ventral proportions: gnathosomal bay length/width <math>1.42-2.06 \ (1.95); \ anterior venter/genital field \ length \ 1.51-1.75 \ (1.70); \ anterior venter \ length/genital field \ width \ 1.78-2.20 \ (2.00); \ anterior venter/medial \ suture \ 3.27-4.40 \ (3.27).$

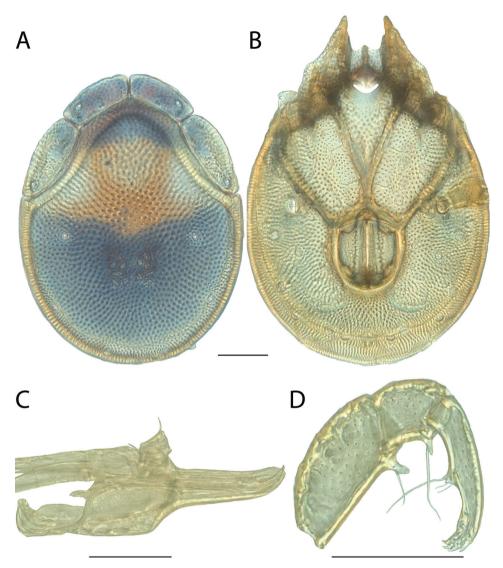

Figure 104. *Torrenticola irapalpa* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

IMMATURES unknown.

Etymology. Specific epithet (*irapalpa*) refers to the pedipalps of this species, which resemble ferocious weapons of wrath (*ira*, L. fury, rage, wrath; *palpus*, L. hand, feeler).

Distribution. Primarily eastern (Figure 102), but note that *T. irapalpa* is one of few *Torrenticola* found in the Great Plains, at least in the south (Texas) and north (Saskatchewan).

Remarks. *Torrenticola irapalpa* groups with other members of the Raptor Complex with high support and specimens of this species are less than 2% different in COI

sequence from each other. In the combined analysis, *T. irapalpa* groups with *T. gnoma* with high support, but the position of this clade was not recovered. These species are greater than 9% from each other. Based upon overall similarity, distribution, and phylogenetic position, this species is placed within the Raptor Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola ivyae Fisher & Dowling, sp. n.

Material examined. HOLOTYPE (♀): from USA, Florida, Polk County, beside Rt. 471 at junction of Pasco, Polk and Sumter County lines, (28°19'19"N, 82°4'4"W), 24 April 1992, by IM Smith, IMS920003

PARATYPES (5 \bigcirc ; 5 \bigtriangledown): **Florida, USA**: 2 \bigcirc from Hillsborough County, beside Rt. 41/301 near Hillsborough River State Park, south of Zephyrhills, (28°10'10"N, 82°12'12"W), 24 April 1992, by IM Smith, IMS920001 • 2 \bigcirc and 3 \circlearrowright from Pasco County, beside Rt. 39 just north of Crystal Springs, (28°11'11"N, 82°10'10"W), 27 April 1992, by IM Smith, IMS920011 • 1 \circlearrowright (ALLOTYPE) from Polk County, beside Rt. 471 at junction of Pasco, Polk and Sumter County lines, (28°19'19"N, 82°4'4"W), 24 April 1992, by IM Smith, IMS920003 • 1 \bigcirc and 1 \circlearrowright from Polk County, beside Rucks Dairy Road 1.3 km south of Lake Arbuckle Road, (27°42'42"N, 81°26'26"W), 25 April 1992, by IM Smith, IMS920004

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and some paratypes (3 \bigcirc ; 2 \circlearrowright) deposited in the CNC; other paratypes (2 \bigcirc ; 2 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola ivyae are similar to other members of the Raptor Group (T. gnoma, T. irapalpa, T. longitibia, T. mjolniri, T. elusiva, T. racupalpa, T. raptor, T. danielleae, and T. daemon) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. T. ivyae can be differentiated from T. gnoma, T. elusiva, T. danielleae, and T. daemon by having a more elongate rostrum (length/width Q = 4.00-4.15 in *T. ivyae*, 2.74-3.75 in others; $\mathcal{J} = 3.85-4.08$ in *T. ivyae*, 2.56–3.57 in others) and more elongate pedipalpal tibiae (length/width Q =5.07–5.64 in *T. ivyae*, 4.05–5.00 in others, $\mathcal{J} = 4.75-5.20$ in *T. ivyae*, 3.88–4.44 in others). T. ivyae can be differentiated from T. irapalpa, T. raptor, T. danielleae, and T. daemon by having Dgl-4 closer to the muscle scars (dorsum width/distance between Dgl-4 = 2.20-2.75 in T. ivyae, 1.42-2.09 in others). T. ivyae can be differentiated from T. longitibia (known only from males) by femur/genu (1.83-1.88 in T. ivyae, 2.1–2.17 in T. longitibia) and having less elongate tibiae (length/width = 4.75-5.20in T. ivyae, 5.50–5.50 in T. longitibia). Female T. ivyae can be differentiated from female *T. racupalpa* by having a more elongate rostrum (length/width = 4.00-4.15 in *T. ivyae*, 3.56–3.82 in *T. racupalpa*) and more elongate pedipalpal tibiae (length/width = 5.07-5.64 in T. ivyae, 4.44-5.00 in T. racupalpa). Male T. ivyae can be differentiated

Figure 105. Torrenticola ivyae sp. n. distribution.

from male *T. racupalpa* by having a longer anterior venter (\bigcirc 220–230 in *T. ivyae*, 200–205 in *T. racupalpa*) and a shorter genital field (\bigcirc 142–148 in *T. ivyae*, 160–165 in *T. racupalpa*). Female *T. ivyae* can be differentiated from female *T. mjolniri* by having a smaller dorsum (length \bigcirc = 550–590 in *T. ivyae*, 605–640 in *T. mjolniri*; width \bigcirc = 460–500 in *T. ivyae*, 510–545 in *T. mjolniri*) and a shorter anterior venter (\bigcirc 155–170 in *T. ivyae*, 180–195 in *T. mjolniri*). Male *T. ivyae* can be differentiated from male *T. mjolniri* by having a less elongate subcapitulum (ventral length/width = 2.57–2.75 in *T. ivyae*, 2.82–3.00 in *T. mjolniri*). Additionally, *T. ivyae* can be differentiated from *T. mjolniri* by being found in Florida (*T. ivyae* is known from the northeast).

Description. FEMALE (Figure 106) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–590 (580) long; 460–500 (495) wide) circular with reddishpurple coloration anteriorly and posteriorly connected medially. Anterio-medial platelets (120–135 (120) long; 60–62.5 (62.5) wide). Anterio-lateral platelets (165–180 (165) long; 65–75 (75) wide) free from dorsal plate. Dgl-4 much closer to the muscle scars than to the edge of the dorsum (distance between Dgl-4 180–195 (180)). Dorsal plate proportions: dorsum length/width 1.16–1.20 (1.17); dorsal width/distance between Dgl-4 2.42–2.75 (2.75); anterio-medial platelet length/width 1.92–2.25 (1.92); anterio-lateral platelet length/width 2.20–2.62 (2.20); anterio-lateral/anterio-medial length 1.26–1.38 (1.38).

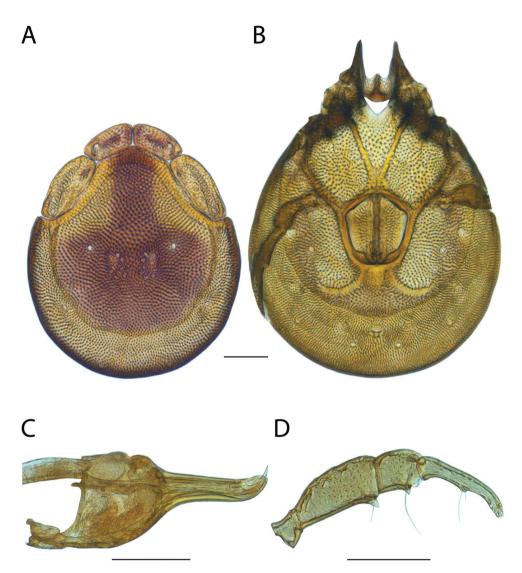

Figure 106. *Torrenticola ivyae* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Gnathosoma — **Subcapitulum** (300–325 (325) long (ventral); 232.5–257.5 (247.5) long (dorsal); 115–127.5 (120) tall) colorless. Rostrum (130–145 (145) long; 32.5–35 (35) wide) elongate. Chelicerae (315–340 (335) long) with curved fangs (55–60 (60) long). Subcapitular proportions: ventral length/height 2.55–2.71 (2.71); rostrum length/width 4.00–4.15 (4.14). **Pedipalps** elongate with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–46.25 (45) long); femur (117.5–125 (125) long); genu (65–67.5 (65) long); tibia (91.25–100)

(95) long; 17.5–18.75 (18.75) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.81–1.92 (1.92); tibia/femur 0.76–0.83 (0.76); tibia length/ width 5.07–5.64 (5.07).

Venter — $(630-755 (750) \log; 490-540 (540) wide) with reddish-purple coloration. Gnathosomal bay (150–175 (165) long; 67.5–75 (72.5) wide). Cxgl-4 far from apex.$ **Medial suture**(25–25 (25) long).**Genital plates**(150–165 (157.5) long; 142.5–150 (150) wide). Additional measurements: Cx-1 (280–300 (300) long (total); 120–145 (145) long (medial)); Cx-3 (320–335 (325) wide); anterior venter (155–170 (170) long). Ventral proportions: gnathosomal bay length/width 2.00–2.44 (2.28); anterior venter/genital field length 0.94–1.13 (1.08); anterior venter length/genital field width 1.03–1.19 (1.13); anterior venter/medial suture 6.20–6.80 (6.80).

MALE (Figure 107) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (530–550 (550) long; 390–450 (420) wide) circular with reddishpurple coloration anteriorly and posteriorly connected medially. Anterio-medial platelets (125–135 (130) long; 55–62.5 (57.5) wide). Anterio-lateral platelets (160–190 (160) long; 60–75 (60) wide) free from dorsal plate. Dgl-4 much closer to the muscle scars than to the edge of the dorsum (distance between Dgl-4 165–205 (180)). Dorsal plate proportions: dorsum length/width 1.19–1.36 (1.31); dorsal width/distance between Dgl-4 2.20–2.39 (2.33); anterio-medial platelet length/width 2.00–2.45 (2.26); anterio-lateral platelet length/width 2.27–2.92 (2.67); anterio-lateral/anterio-medial length 1.23–1.46 (1.23).

Gnathosoma — **Subcapitulum** (295–302.5 (300) long (ventral); 220–230 (220) long (dorsal); 110–115 (110) tall) colorless. Rostrum (125–132.5 (130) long; 32.5-32.5 (32.5) wide) elongate. Chelicerae (295–305 (295) long) with curved fangs (45–50 (50) long). Subcapitular proportions: ventral length/height 2.57–2.75 (2.73); rostrum length/width 3.85–4.08 (4.00). Pedipalps elongate with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–42.5 (40) long); femur (110–112.5 (110) long); genu (60–60 (60) long); tibia (90–97.5 (90) long; 17.5–20 (17.5) wide); tarsus (15–16.25 (16.25) long). Palpomere proportions: femur/genu 1.83–1.88 (1.83); tibia/femur 0.82–0.87 (0.82); tibia length/width 4.75–5.20 (5.14).

Venter — $(625-700 (700) \log; 470-500 (470) wide)$ with reddish-purple coloration. Gnathosomal bay (140–150 (142.5) long; 62.5–72.5 (65) wide). Cxgl-4 far from apex. **Medial suture** (60–80 (75) long). **Genital plates** (142.5–147.5 (145) long; 112.5–125 (120) wide). Additional measurements: Cx-1 (280–290 (280) long (total); 125–145 (145) long (medial)); Cx-3 (310–330 (310) wide); anterior venter (220–230 (230) long). Ventral proportions: gnathosomal bay length/width 1.93–2.36 (2.19); anterior venter/genital field length 1.52–1.59 (1.59); anterior venter length/genital field width 1.76–2.00 (1.92); anterior venter/medial suture 2.75–3.67 (3.07).

IMMATURES unknown.

Etymology. Specific epithet (*ivyae*) named in honor of Ivy Fisher, our (JRF and DMF) beautiful daughter, who was born in Florida, the type locality.

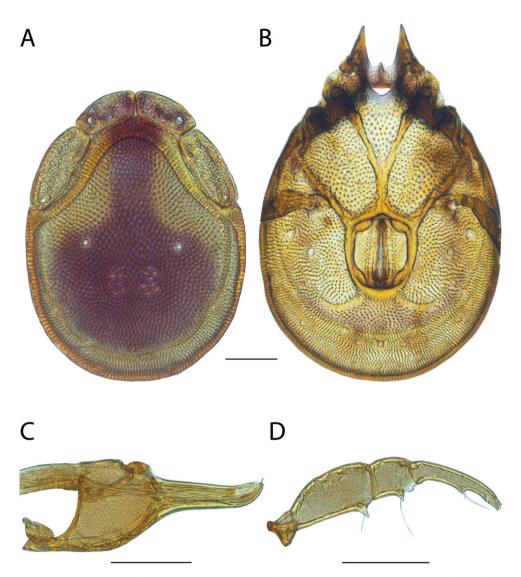

Figure 107. *Torrenticola ivyae* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Distribution. Florida (Figure 105).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola ivyae* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, elongate subcapitular rostra, elongate pedipalpal tibiae, and Dgl-4 close to the muscle scars, are consistent with placing this species in the Raptor Complex and Raptor Identification Group.

Torrenticola karambita Fisher & Dowling, sp. n. http://zoobank.org/240C5D4A-99BD-4BF1-9930-9D02B73479FC

Material examined. HOLOTYPE (\bigcirc): from USA, Tennessee, Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail (35°40'47"N, 83°31'51"W), 10 Sep 2010, by IM Smith, IMS100125, DNA 1758.

PARATYPES $(1 \ Q; 3 \ Q)$: 1 $\ Q$ (ALLOTYPE) from Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail (35°40'47"N, 83°31'51"W), 10 Sep 2010, by IM Smith, IMS100125, DNA 1846 • 1 $\ Q$ and 2 $\ Q$ from Sevier County, Great Smokey Mountains National Park, Sugarlands Nature Trail (35°40'47"N, 83°31'51"W), 10 Sep 2010, by IM Smith, IMS100125

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and some paratypes $(1 \bigcirc)$ deposited in the CNC; other paratypes $(1 \bigcirc; 1 \bigcirc)$ deposited in the ACUA.

Diagnosis. Torrenticola karambita is similar to other members of the Erectirostra Group (*T. erectirostra* and *T. robisoni*) in having an upturned rostrum that is wide when viewed ventrally. *T. karambita* can be differentiated from *T. erectirostra* and *T. robisoni* by lacking coloration (*T. erectirostra* has purplish dorsal coloration) and a slightly stockier rostrum (length/width Q = 1.57-1.62 in *T. karambita*, 1.72–2.09 in others; $\mathcal{J} = 1.6-1.95$ in *T. karambita*, 2.0–2.2 in *T. erectirostra*).

Description. FEMALE (Figure 109) (n = 2) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (690–725 (690) long; 490–500 (490) wide) ovoid and colorless. Anterio-medial platelets (145–162.5 (145) long; 65–75 (65) wide). Anterio-lateral platelets (217.5–220 (217.5) long; 80–82.5 (82.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 340–360 (340)). Dorsal plate proportions: dorsum length/width 1.41–1.45 (1.41); dorsal width/distance between Dgl-4 1.39–1.44 (1.44); anterio-medial platelet length/width 2.17–2.23 (2.23); anterio-lateral platelet length/width 2.64–2.75 (2.64); anterio-lateral/anterio-medial length 1.35–1.50 (1.50).

Gnathosoma — **Subcapitulum** (325–350 (325) long (ventral); 229–254 (229) long (dorsal); 135–135 (135) tall) colorless. Rostrum (110–117.5 (110) long; 70–72.5 (70) wide) wide and unturned with dentation. Chelicerae (320–329 (321) long) with curved fangs (40–52 (41) long). Subcapitular proportions: ventral length/height 2.41–2.59 (2.41); rostrum length/width 1.57–1.62 (1.57). **Pedipalps** short and stocky (especially tibiae) with short tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (52.5–55 (52.5) long); femur (101.25–105 (101.25) long); genu (65–67.5 (67.5) long); tibia (55–57.5 (55) long; 30–30 (30) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.50–1.62 (1.50); tibia/femur 0.54–0.55 (0.54); tibia length/width 1.83–1.92 (1.83).

Venter — (850–850 (850) long; 595–607 (607) wide) colorless. Gnathosomal bay (170–172.5 (172.5) long; 125–130 (130) wide). Cxgl-4 far from apex. **Medial suture** (15–17.5 (15) long). **Genital plates** (195–197.5 (195) long; 165–175 (165) wide). Additional measurements: Cx-1 (336–348 (336) long (total); 159–175 (174)

Figure 108. Torrenticola karambita sp. n. distribution.

long (medial)); Cx-3 (415–441 (415) wide); anterior venter (202.5–222.5 (202.5) long). Ventral proportions: gnathosomal bay length/width 1.33–1.36 (1.33); anterior venter/genital field length 1.04–1.13 (1.04); anterior venter length/genital field width 1.23–1.27 (1.23); anterior venter/medial suture 12.71–13.50 (13.50).

MALE (Figure 110) (n = 3) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (610–655 (610) long; 410–440 (420) wide) ovoid and colorless. Anterio-medial platelets (133.75–145 (133.75) long; 65–67.5 (65) wide). Anterio-lateral platelets (205–217.5 (207.5) long; 75–77.5 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 290–330 (290)). Dorsal plate proportions: dorsum length/width 1.44–1.60 (1.45); dorsal width/distance between Dgl-4 1.33–1.45 (1.45); anterio-medial platelet length/width 2.06–2.19 (2.06); anterio-lateral platelet length/width 2.65–2.81 (2.77); anterio-lateral/anterio-medial length 1.44–1.55 (1.55).

Gnathosoma — **Subcapitulum** (285–290 (290) long (ventral); 202–210 (202) long (dorsal); 108.75–115 (112.5) tall) colorless. Rostrum (97.5–102.5 (97.5) long; 52.5–60 (60) wide) wide and unturned with dentation. Chelicerae (268–269 (269) long) with curved fangs (43–52 (47) long). Subcapitular proportions: ventral length/ height 2.48–2.67 (2.58); rostrum length/width 1.63–1.95 (1.63). **Pedipalps** short and stocky (especially tibiae) with short tuberculate ventral extensions on femora and

long (medial)); Cx-3 (366–373 (372) wide); anterior venter (247.5–248.75 (248.75) long). Ventral proportions: gnathosomal bay length/width 1.53–1.67 (1.53); anterior venter/genital field length 1.48–1.58 (1.58); anterior venter length/genital field width 1.99–2.06 (1.99); anterior venter/medial suture 3.19–3.54 (3.21).

IMMATURES unknown.

Etymology. Specific epithet (*karambita*) refers to the upturned rostrum that has dentation on both sides in females, which resembles a karambit—small, recurved

knives used in the Filipino martial arts practiced by JRF. The karambit is thought to have originated with the Minangkabau people of West Sumatra based upon a similarity to a tiger's claws.

Distribution. Known only from Great Smokey Mountains National Park, Sevier County, Tennessee (Figure 108).

Remarks. Torrenticola karambita groups with other members of the Raptor Complex with high support in all analyses and specimens are less than 2% different in COI sequence from each other. In the combined analysis, *T. karambita* groups with two other species that share the modified subcapitulum with upturned rostrum: *T. erectirostra* and *T. robisoni*. These species are greater than 9% different from each other. Based upon overall similarity, distribution, and phylogenetic position, these species are placed within the Erectirostra Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%), high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola keesdavidsi Cramer, 1992

Torrenticola keesdavidsi Cramer, 1992: 17.

Material examined (6 \bigcirc ; 10 \bigcirc). Arizona, USA: 1 \bigcirc and 1 \bigcirc from Cochise County, Chiricahua Mountains; beside Forest Road 42 near junction with Forest Road 42B, (31°55'55"N, 109°15'15"W), 16 July 1987, by IM Smith, IMS870093A • 1 ♀ and 1 & from Cochise County, Chiricahua Mountains; Sycamore Campground east of Sunizona, (31°52'52"N, 109°20'20"W), 15 July 1987, by IM Smith, IMS870091 • 3 I from Cochise County, Chiricahua Mountains; Cave Creek Recreation Area; John Hands Picnic Area off Forest Road 42A west of Portal, (31°53'53"N, 109°13'13"W), 15 July 1987, by IM Smith, IMS870092A • 1 ♀ and 1 ♂ from Coconino County, Oak Creek Canyon; beside Rt. 89A just north of Pine Flat Campground, (35°1'1"N, 111°44'44"W), 21 July 1987, by IM Smith, IMS870099A • 1 9 from Coconino County, Oak Creek Canyon; beside Rt. 89A between Bootlegger and Banjo Bill Campgrounds, (34°58'58"N, 111°45'45"W), 21 July 1987, by IM Smith, IMS870100B • 1 I from Coconino County, Oak Creek Canyon; beside Rt. 89A just north of Pine Flat Campground, (35°1'1"N, 111°44'44"W), 21 July 1987, by IM Smith, IMS870099B • New Mexico, USA: 2 9 from Catron County, Glenwood; Whitewater Picnic Area 8 km east of Rt. 180, (33°22'22"N, 108°50'50"W), 12 July 1987, by IM Smith, IMS870084 • 2 d from Catron County, beside Rt. 15, 65 km north of Rt. 180 (Silver City), (33°12'12"N, 108°13'13"W), 10 July 1987, by IM Smith, IMS870081A • 1 Å from Catron County, beside Rt. 15, 65 km north of Rt. 180 (Silver City), (33°12'12"N, 108°13'13"W), 10 July 1987, by IM Smith, IMS870081B.

Type deposition. Holotype (\bigcirc) and allotype (\bigcirc) deposited in coll. Cristina Cramer, Instituto de Biología, UNAM.

Figure 111. *Torrenticola keesdavidsi* distribution. Blue star represents type locality (Cramer 1992); and red circles represent new records and material examined.

Diagnosis. Torrenticola keesdavidsi are similar to other members of the Rala Group (*T. rala, T. lamellipalpis, T. boettgeri, T. kurtvietsi, T. dolichodactyla*, and *T. anoplopalpa*) by being colorless, having incomplete hind coxal margins and being distributed in the southwest. *T. keesdavidsi* can be differentiated from all other Rala Group by having a shorter dorsum (length Q = 555-605 in *T. keesdavidsi*, 630–800 in others; $\delta = 500-590$ in *T. keesdavidsi*, 600–780 in others) and dentate, flanged ventral extensions on the femora (others are lacking extensions, have tuberculate extensions, or flat, wide lamellate extensions). Additionally, *T. keesdavidsi* can be differentiated from all other Rala Group by having more elongate pedipalpal tibiae (length/width = 4.50–5.20 in *T. keesdavidsi*, 1.75–3.38 in others), except *T. lamellipalpis* (4.32–4.94).

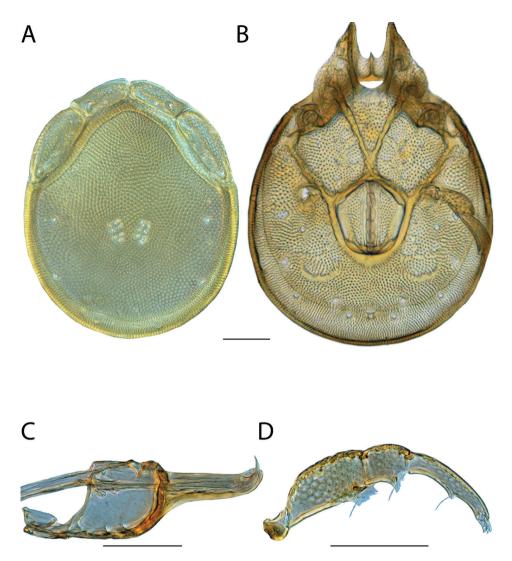

Figure 112. *Torrenticola keesdavidsi* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Re-description. FEMALE (Figure 112) (n = 5) with characters of the genus with following specifications.

Dorsum — (555–605 long; 450–495 wide) circular and colorless. Anterio-medial platelets (135–137.5 long; 50–60 wide). Anterio-lateral platelets (180–192.5 long; 70–80 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 315–335). Dorsal plate proportions: dorsum length/width 1.21–1.31; dorsal width/distance between Dgl-4 1.41–1.48; anterio-medial platelet length/width 2.25–2.70; anterio-lateral platelet length/width 2.38–2.75; anterio-lateral/anterio-medial length 1.33–1.43.

Gnathosoma — **Subcapitulum** (312.5–327.5 long (ventral); 222.5–240 long (dorsal); 97.5–105 tall) colorless. Rostrum (120–130 long; 35–37.5 wide). Chelicerae (295–310 long) with curved fangs (45–50 long). Subcapitular proportions: ventral length/height 3.07–3.21; rostrum length/width 3.33–3.57. **Pedipalps** with dentate, flanged ventral extensions on femora and genua. Palpomeres: trochanter (35–37.5 long); femur (105–110 long); genu (55–57.5 long); tibia (90–95 long; 18.75–20 wide); tarsus (15–17.5 long). Palpomere proportions: femur/genu 1.91–2.00; tibia/femur 0.84–0.88; tibia length/width 4.50–4.93.

Venter — (695–755 long; 510–560 wide) colorless. Gnathosomal bay (145–150 long; 67.5–80 wide). Cxgl-4 far from apex. **Medial suture** (35–55 long). **Genital plates** (162.5–175 long; 152.5–160 wide). Additional measurements: Cx-1 (285–295 long (total); 140–150 long (medial)); Cx-3 (320–330 wide); anterior venter (192.5–222.5 long). Ventral proportions: gnathosomal bay length/width 1.88–2.19; anterior venter/genital field length 1.18–1.29; anterior venter length/genital field width 1.26–1.44; anterior venter/medial suture 4.05–5.50.

MALE (Figure 113) (n = 5) with characters of the genus with following specifications.

Dorsum — (500–590 long; 410–450 wide) circular and colorless. Anterio-medial platelets (120–130 long; 55–60 wide). Anterio-lateral platelets (165–190 long; 65–75 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 280–320). Dorsal plate proportions: dorsum length/ width 1.21–1.33; dorsal width/distance between Dgl-4 1.40–1.48; anterio-medial platelet length/width 2.09–2.27; anterio-lateral platelet length/width 2.33–2.71; anterio-lateral/anterio-medial length 1.32–1.48.

Gnathosoma — Subcapitulum (280–310 long (ventral); 202.5–230 long (dorsal); 85–105 tall) colorless. Rostrum (107.5–125 long; 32.5–35 wide). Chelicerae (260–297.5 long) with curved fangs (40–50 long). Subcapitular proportions: ventral length/ height 2.81–3.29; rostrum length/width 3.29–3.57. Pedipalps with dentate, flanged ventral extensions on femora and genua. Palpomeres: trochanter (32.5–35 long); femur (97.5–110 long); genu (50–56.25 long); tibia (87.5–97.5 long; 17.5–20 wide); tarsus (15–17.5 long). Palpomere proportions: femur/genu 1.84–1.96; tibia/femur 0.86–0.95; tibia length/width 4.81–5.20.

Venter — (630–720 long; 460–510 wide) colorless. Gnathosomal bay (130–152.5 long; 60–75 wide). Cxgl-4 far from apex. **Medial suture** (80–95 long). **Genital plates** (140–155 long; 115–125 wide). Additional measurements: Cx-1 (260–280 long (to-tal); 130–150 long (medial)); Cx-3 (280–340 wide); anterior venter (225–260 long). Ventral proportions: gnathosomal bay length/width 1.93–2.17; anterior venter/genital field length 1.55–1.86; anterior venter length/genital field width 1.96–2.17; anterior venter/medial suture 2.61–2.89.

IMMATURES unknown.

Etymology. Cramer (1992) named this species in honor of Kees Davids "as an acknowledgement of his great contributions to acarology and aquatic ecology" (translated from Spanish).

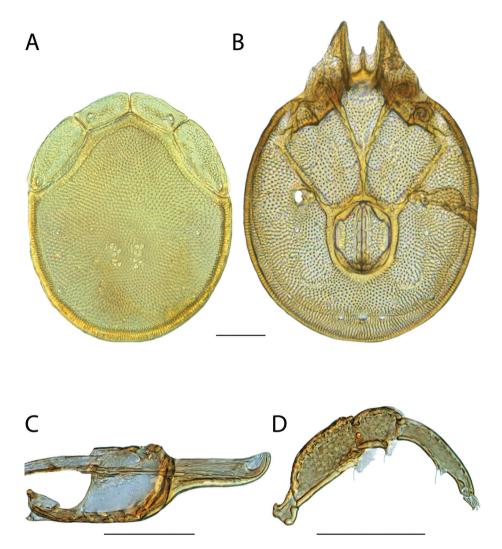

Figure 113. *Torrenticola keesdavidsi* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Distribution. Southwest (Arizona and New Mexico), extending southward into Mexico (Figure 111).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola keesdavidsi* and therefore this species is not included in our phylogenetic analyses. We were also unable to examine type material. However, we were able to examine new material from Arizona and New Mexico that fits well within the species hypothesis proposed by Cramer (1992). The overall appearance, incomplete hind coxal margins, distribution, and lack of color place this species in the Rala Group.

Torrenticola kittatinniana Habeeb, 1955

Torrenticola kittatinniana Habeeb, 1955: 2.

Material examined. HOLOTYPE (♂): from USA, New Jersey, Sussex County, Little Flatbrook, north of Bevans, 12 Oct 1953, by H Habeeb, HH530110.

PARATYPES (1 \bigcirc and 0 \oslash): **New Jersey, USA**: 1 \bigcirc (ALLOTYPE) from Morris County, Brook, Brookside, 20 May 1953, by H Habeeb, HH530045.

Type deposition. Holotype (\bigcirc) and paratypes (1 \bigcirc) deposited in the CNC.

Diagnosis. Torrenticola kittatinniana are similar to other members of the Rusetria "4-Plate" group (T. dunni, T. glomerabilis, T. pollani, T. rufoalba and T. shubini) and T. skvarlai in having anterio-lateral platelets free from the dorsal plate, dorsal coloration separated into anterior and posterior portions, and indistinct hind coxal margins. Female T. kittatinniana can be differentiated from female T. dunni by having shorter pedipalpal genua (64 in T. kittatinniana, 70-75 in T. dunni); a shorter subcapitulum (ventral length = 310 in T. kittatinniana, 330-355 in T. dunni); and stockier anteriomedial platelets (length/width = 2.83 in T. kittatinniana, 2.33–2.54 in T. dunni). Male T. kittatinniana can be differentiated from male T. dunni by having a shorter anterior venter (235 in T. kittatinniana, 277-285 in T. dunni) and thinner dorsum (340 in T. kittatinniana, 350–370 in T. dunni). T. kittatinniana can be differentiated from T. pollani by having a stockier rostrum (length/width = 2.71-3.16 in T. kittatinniana, 3.27–3.82 in *T. pollani*) and stockier tibiae (length/width Q = 3.3 in *T. kittatinniana*, 3.8–4.2 in T. pollani; $\mathcal{O} = 2.80$ in T. kittatinniana, 3.4–3.8 in T. pollani). Female T. kittatinniana can be differentiated from female T. shubini by having a more elongate rostrum (length/width = 3.16 in T. kittatinniana, 2.5-2.7 in T. shubini) and a shorter subcapitulum (125 in T. kittatinniana, 140-145 in T. shubini). Male T. kittatinniana can be differentiated from male T. shubini by having a longer dorsum (500 in T. kittatinniana, 400–465 in T. shubini) and a longer genital field (115 in T. kittatinniana, 90-108 in T. shubini). T. kittatinniana can be differentiated from T. glomerabilis by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 = 1.2-1.4in *T. kittatinniana*, 1.5–1.7 in *T. glomerabilis*) and stockier tibiae (length/width Q = 3.3 in T. kittatinniana, 4.11–4.5 in T. glomerabilis; 👌 = 2.8 in T. kittatinniana, 3.5–4.4 in T. glomerabilis). T. kittatinniana can be differentiated from T. rufoalba by having a longer dorsum (\bigcirc = 640 in *T. kittatinniana*, 550 in *T. rufoalba*; \bigcirc = 500 in *T. kittatin*niana, 440 in T. rufoalba) and more elongate anterio-medial platelets (length/width = 2.83-2.88 in T. kittatinniana, 2.45-2.61 in T. rufoalba). Additionally, male T. kittatinniana have a longer anterior venter (235 in T. kittatinniana, 195 in T. rufoalba). T. kittatinniana can be differentiated from T. skvarlai by having a conical pedipalpal femoral tubercle, whereas *T. skvarlai* has a broad and flat pedipalpal femoral tubercle, and by having a longer anterior venter ($\mathcal{Q} = 165$ in *T. kittatinniana*, 140–152.5 in *T. skvarlai*; \bigcirc = 235 in *T. kittatinniana*, 177.5–205 in *T. skvarlai*).

Re-description. FEMALE (Figure 115) (n = 1) (allotype only) with characters of the genus with following specifications.

Figure 114. Torrenticola kittatinniana distribution.

Dorsum — (550 long; 400 wide) ovoid with purple coloration separated into anterior and posterior portions bordered with orange. Anterio-medial platelets (107.5 long; 41.25 wide). Anterio-lateral platelets (168.75 long; 55 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 255). Dorsal plate proportions: dorsum length/width 1.38; dorsal width/distance between Dgl-4 1.57; anterio-medial platelet length/width 2.61; anterio-lateral platelet length/width 3.07; anterio-lateral/anterio-medial length 1.57.

Gnathosoma— **Subcapitulum** (310 long (ventral); 235 long (dorsal); 127.5 tall) colorless. Rostrum (130 long; 42.5 wide). Chelicerae (315 long) with curved fangs (62.5 long). Subcapitular proportions: ventral length/height 2.43; rostrum length/ width 3.06. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5 long); femur (115 long); genu (65 long); tibia (87.5 long; 25 wide); tarsus (17.5 long). Palpomere proportions: femur/genu 1.77; tibia/femur 0.76; tibia length/width 3.50.

Venter — (640 long; 450 wide) mostly colorless with faint purple coloration in areas surrounding coxae. Gnathosomal bay (142.5 long; 92.5 wide). Cxgl-4 subapical. **Medial suture** (17.5 long). **Genital plates** (167.5 long; 155 wide). Additional measurements: Cx-1 (125 long (total); 125 long (medial)); Cx-3 (335 wide); anterior venter (155 long). Ventral proportions: gnathosomal bay length/width 1.54; anterior venter/genital field length 0.93; anterior venter length/genital field width 1.00; anterior venter/ter/medial suture 8.86.

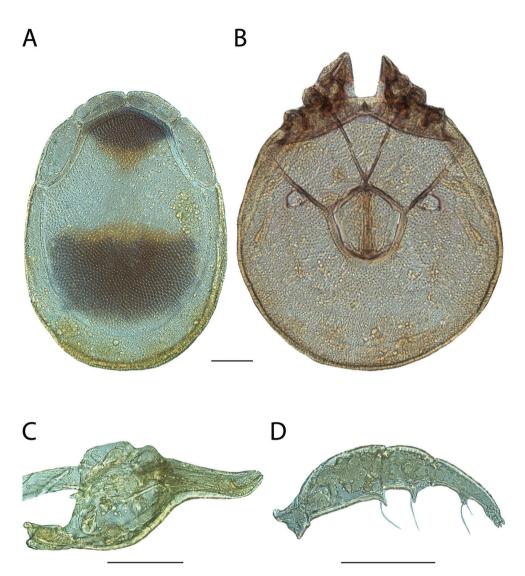

Figure 115. *Torrenticola kittatinniana* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

MALE (Figure 116) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum — (500 long; 340 wide) ovoid with purple coloration separated into anterior and posterior portions bordered with orange. Anterio-medial platelets (90 long; 31.25 wide). Anterio-lateral platelets (140 long; 47.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 280). Dorsal plate proportions: dorsum length/width 1.47; dorsal width/dis-

IMMATURES unknown.

Etymology. Habeeb (1955) did not specify an explanation for the specific epithet (*kittatinniana*). However, we suspect it refers to the type locality, which is located in the Great Kittatinny Valley, which is named for Kittatinny Mountain in northwestern New Jersey, a northern extension of the Appalachian Ridge and Valley province.

Distribution. Northern New Jersey (Figure 114).

Remarks. Unfortunately, we were unable to acquire more specimens of *Torrentico-la kittatinniana* and therefore this species is not included in our phylogenetic analyses. We were able to examine the type specimens. Based upon overall similarity, fusion of the posterio-lateral platelets with the dorsal plate, and distribution, this species clearly groups with other members of the Rusetria Complex and we are able to place it within the Eastern 4-Plate Identification Group.

Torrenticola kringi Fisher & Dowling, sp. n. http://zoobank.org/C5724C7A-F8A6-4E6F-9F34-8B08DB3E99DB

Material examined. HOLOTYPE (\bigcirc): from USA, Texas, Tyler County, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A.

PARATYPES (4 \bigcirc ; 5 \circlearrowright): **Texas, USA**: 1 \circlearrowright (ALLOTYPE) from Tyler County, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A • 4 \bigcirc and 4 \circlearrowright from Tyler, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \textcircled{O})$ deposited in the ACUA.

Diagnosis. *Torrenticola kringi* are similar to other members of the Tricolor Complex (*T. bittikoferae, T. hoosieri, T. larvata, T. pearsoni, T. olliei, T. sierrensis, T. tricolor, T. trimaculata, T. unimaculata, T. cardia, T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. kringi* can be differentiated from most *Torrenticola*, including other members of the Tricolor Complex, by having a distinct dorsal pattern of a large anterior dorsal spot. The only other species with this pattern is *T. ululata*, which, like all Rusetria 2-Plates, have anterio-lateral platelets fused to the dorsal plate and *T. unimaculata*, which has a stockier rostrum (length/width = 2.6–3.2 in *T. kringi*, 1.9–2.2 in *T. unimaculata*). *T. kringi* are

Figure 117. Torrenticola kringi sp. n. distribution.

most similar to other members of the Tricolor Complex that have bold patterning (*T. larvata, T. tricolor, T. trimaculata, T. un*imaculata, *T. cardia,* and *T. mohawk*). *T. kringi* can be further differentiated from all other members of the Tricolor Complex by having a more elongate rostrum (length/width = 2.67–3.13 in *T. kringi*, 1.29–2.59).

Description. FEMALE (Figure 118) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–580 (580) long; 460–500 (490) wide) circular with coloration restricted to a single dark spot anteriorly (occasionally extending medially), with an orange spot posterior to the dark spot. Anterio-medial platelets (125–145 (145) long; 60–70 (70) wide). Anterio-lateral platelets (160–185 (185) long; 65–75 (75) wide) free to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 335–365 (350)). Dorsal plate proportions: dorsum length/ width 1.15–1.20 (1.18); dorsal width/distance between Dgl-4 1.26–1.46 (1.40); anterio-medial platelet length/width 2.00–2.25 (2.07); anterio-lateral platelet length/ width 2.29–2.69 (2.47); anterio-lateral/anterio-medial length 1.19–1.40 (1.28).

Gnathosoma — **Subcapitulum** (290–302.5 (300) long (ventral); 215–227.5 (227.5) long (dorsal); 117.5–125 (125) tall) colorless. Rostrum (120–130 (125) long; 40–45 (42.5) wide). Chelicerae (275–300 (290) long) with curved fangs (50–55 (50) long). Subcapitular proportions: ventral length/height 2.34–2.47 (2.40); rostrum length/width 2.67–3.13 (2.94). **Pedipalps** with tuberculate ventral extensions on fem-

dial)); Cx-3 (320–345 (345) wide); anterior venter (145–170 (170) long). Ventral proportions: gnathosomal bay length/width 1.67–1.94 (1.76); anterior venter/genital field length 0.85–0.97 (0.94); anterior venter length/genital field width 0.92–1.07 (1.06); anterior venter/medial suture 5.17–6.44 (5.67).

MALE (Figure 119) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (480–560 (510) long; 395–465 (420) wide) circular with coloration restricted to a single dark spot anteriorly (occasionally extending medially), with an

orange spot posterior to the dark spot. Anterio-medial platelets (110–130 (117.5) long; 52.5–65 (57.5) wide). Anterio-lateral platelets (140–170 (150) long; 50–75 (60) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 285–350 (315)). Dorsal plate proportions: dorsum length/width 1.19–1.30 (1.21); dorsal width/distance between Dgl-4 1.29–1.39 (1.33); anterio-medial platelet length/width 1.96–2.27 (2.04); anterio-lateral platelet length/ width 2.27–2.80 (2.50); anterio-lateral/anterio-medial length 1.27–1.31 (1.28).

Gnathosoma — **Subcapitulum** (240–275 (260) long (ventral); 177.5–210 (195) long (dorsal); 90–105 (100) tall) colorless. Rostrum (100–115 (110) long; 35–40 (37.5) wide). Chelicerae (225–270 (260) long) with curved fangs (45–50 (50) long). Subcapitular proportions: ventral length/height 2.55–2.75 (2.60); rostrum length/ width 2.81–2.93 (2.93). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–38.75 (37.5) long); femur (85–101.25 (97.5) long); genu (60–71.25 (67.5) long); tibia (70–82.5 (77.5) long; 23.75–27.5 (26.25) wide); tarsus (22.5–25 (23.75) long). Palpomere proportions: femur/genu 1.36–1.44 (1.44); tibia/femur 0.79–0.87 (0.79); tibia length/width 2.95–3.14 (2.95).

Venter — (590–695 (640) long; 440–510 (470) colorless. Gnathosomal bay (100–130 (115) long; 62.5–77.5 (75) wide). Cxgl-4 subapical. **Medial suture** (85–100 (85) long). **Genital plates** (115–130 (125) long; 95–105 (100) wide). Additional measurements: Cx-1 (220–270 (250) long (total); 120–150 (145) long (medial)); Cx-3 (275–325 (305) wide); anterior venter (220–255 (240) long). Ventral proportions: gnathosomal bay length/width 1.53–1.79 (1.53); anterior venter/genital field length 1.87–1.96 (1.92); anterior venter length/genital field width 2.32–2.43 (2.40); anterior venter/medial suture 2.44–2.83 (2.82).

IMMATURES unknown.

Etymology. Specific epithet (*kringi*) named in honor of Tim Kring, Department Head of Entomology at Virginia Tech, who was a member of JRF's Ph.D. committee. His friendship, humor, advice, and student-focused approach has been a great influence to JRF.

Distribution. Eastern Texas (Figure 117).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola kringi* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, conical rostrum that is downturned in males, and distribution, are consistent with placing this species in the Tricolor Complex and among eastern members of the Tricolor Identification Group.

Torrenticola kurtvietsi Cramer, 1992

Torrenticola kurtvietsi Cramer, 1992: 24.

Material examined (9 \bigcirc ; 3 \bigcirc). Arizona, USA: 1 \bigcirc and 1 \bigcirc from Cochise County, Chiricahua Mountains; Cave Creek Recreation Area; John Hands Picnic Area

Type deposition. Holotype (\bigcirc), and allotype (\bigcirc), deposited in Cristina Cramer's collection at the Instituto de Biología, UNAM.

Diagnosis. Torrenticola kurtvietsi are similar to other members of the Rala Group (*T. rala, T. keesdavidsi, T. boettgeri, T. lamellipalpis, T. dolichodactyla,* and *T. anoplopalpa*) by being colorless, having incomplete hind coxal margins and being distributed in the southwest. *T. kurtvietsi* can be differentiated from all other Rala Group by having a more elongate gnathosomal bay (length/width = 4.47-5.43 in *T. kurtvietsi,* 1.48-2.73 in others), except *T. boettgeri* (3.85-5.00); and stockier pedipalpal tibiae (length/width = 1.75-2.00 in *T. kurtvietsi,* 2.71-5.20 in others), except *T. boettgeri* (1.86-2.14). *T. kurtvietsi* can be differentiated from *T. boettgeri* by having a less elongate dorsum (length/width = 1.29-1.42 in *T. kurtvietsi,* 1.74-1.82 in *T. boettgeri*) and a more elongate subcapitulum (ventral length/width = 2.51-2.70 in *T. kurtvietsi,* 1.96-2.07 in *T. boettgeri*).

Re-description. FEMALE (Figure 121) (n = 5) with characters of the genus with following specifications.

Dorsum — (680–730 long; 510–560 wide) circular with light pink coloration without a distinct pattern or colorless. Anterio-medial platelets (135–150 long; 60–70 wide). Anterio-lateral platelets (185–215 long; 75–80 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 360–410). Dorsal plate proportions: dorsum length/width 1.29–1.34; dorsal width/ distance between Dgl-4 1.34–1.44; anterio-medial platelet length/width 2.07–2.25; anterio-lateral platelet length/width 2.47–2.80; anterio-lateral/anterio-medial length 1.33–1.48.

Gnathosoma — **Subcapitulum** (310–332.5 long (ventral); 205–230 long (dorsal); 115–132.5 tall) colorless. Rostrum (105–112.5 long; 35–35 wide). Chelicerae (325–360 long) with curved fangs (45–55 long). Subcapitular proportions: ventral length/height 2.51–2.70; rostrum length/width 3.00–3.21. **Pedipalps** short and stocky (especially tibiae) without extensions on femora and genua. Palpomeres: trochanter (30–35 long); femur 78.75–87.5 long); genu (57.5–62.5 long); tibia (35–40 long; 20–20 wide); tarsus (12.5–15 long). Palpomere proportions: femur/genu 1.37–1.48; tibia/femur 0.41–0.47; tibia length/width 1.75–2.00.

Venter — (840–915 long; 610–650 wide) colorless. Gnathosomal bay (180–205 long; 35–42.5 wide). Cxgl-4 apical. **Medial suture** (40–47.5 long). **Genital plates** (185–195 long; 165–177.5 wide). Additional measurements: Cx-1 (340–360 long (to-tal); 150–180 long (medial)); Cx-3 (370–390 wide); anterior venter (210–225 long). Ventral proportions: gnathosomal bay length/width 4.75–5.43; anterior venter/genital field length 1.08–1.18; anterior venter length/genital field width 1.18–1.33; anterior venter/medial suture 4.53–5.25.

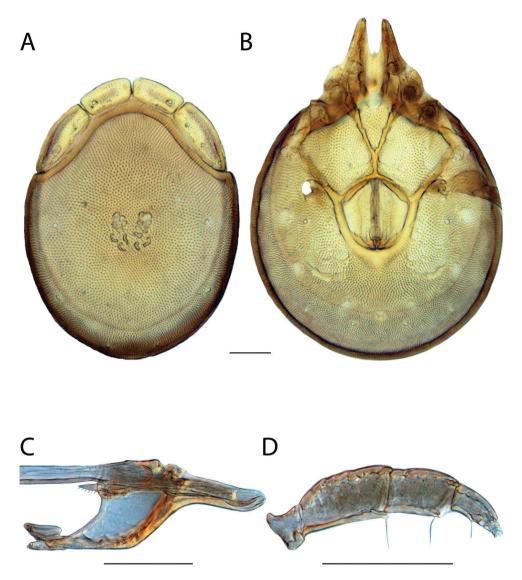

Figure 121. *Torrenticola kurtvietsi* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

MALE (Figure 122) (n = 4) with characters of the genus with following specifications.

Dorsum — (610–650 long; 450–470 wide) circular with light pink coloration without a distinct pattern or colorless. Anterio-medial platelets (140–150 long; 62.5–65 wide). Anterio-lateral platelets (195–205 long; 70–75 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 345–360). Dorsal plate proportions: dorsum length/width 1.31–1.42; dorsal width/distance between Dgl-4 1.30–1.35; anterio-medial platelet length/width

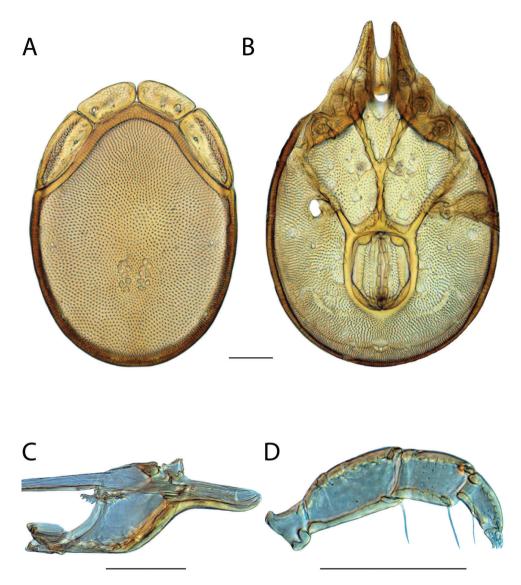

Figure 122. *Torrenticola kurtvietsi* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

2.19–2.31; anterio-lateral platelet length/width 2.67–2.79; anterio-lateral/anterio-medial length 1.33–1.46.

Gnathosoma — Subcapitulum (297.5–310 long (ventral); 205–215 long (dorsal); 112.5–115 tall) colorless. Rostrum (100–107.5 long; 35–35 wide). Chelicerae (325–355 long) with curved fangs (50–50 long). Subcapitular proportions: ventral length/height 2.64–2.70; rostrum length/width 2.86–3.07. **Pedipalps** short and stocky (especially tibiae) without extensions on femora and genua. Palpomeres: trochanter (27.5–35 long); femur (75–82.5 long); genu (57.5–60 long); tibia (36.25–38.75 long; 18.75–21.25 wide); tarsus (10–15 long). Palpomere proportions: femur/ genu 1.29–1.43; tibia/femur 0.45–0.48; tibia length/width 1.81–2.00.

Venter — (785–815 long; 530–540 wide) colorless. Gnathosomal bay (185–195 long; 40–42.5 wide). Cxgl-4 apical. **Medial suture** (100–120 long). **Genital plates** (175–185 long; 135–140 wide). Additional measurements: Cx-1 (340–350 long (to-tal); 150–170 long (medial)); Cx-3 (360–370 wide); anterior venter (287.5–307.5 long). Ventral proportions: gnathosomal bay length/width 4.47–4.81; anterior venter/genital field length 1.58–1.71; anterior venter length/genital field width 135–140; anterior venter/medial suture 2.40–3.00.

IMMATURES unknown.

Etymology. Cramer (1992) named this species in honor of Kurt O. Viets "in recognition of his great contribution to the knowledge of aquatic mites and especially for his invaluable efforts in bringing together the world catalog on this subject" (translated from Spanish).

Distribution. Southeastern Arizona (probably also western New Mexico), extending south into Mexico (Figure 120).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola kurtvietsi* and therefore this species is not included in our phylogenetic analyses. We were also unable to examine type material. However, we were able to examine new material from Arizona and Mexico. Based upon overall similarity, incomplete hind coxal margins, distribution, and lack of coloration, this species fits within our concept of the Rala Identification Group.

Torrenticola lamellipalpis K.O. Viets, 1977

Torrenticola lamellipalpis K.O. Viets, 1977b: 534.

Material examined (5 \bigcirc ; 4 \bigcirc **). New Mexico, USA**: 2 \bigcirc and 2 \oslash from Catron County, beside Rt. 15, 65 km north of Rt. 180 (Silver City), (33°12'12"N, 108°13'13"W), 10 July 1987, by IM Smith, IMS870081A • 2 \bigcirc from Catron County, beside Rt. 15 just below mouth of Little Creek, (33°12'12"N, 108°13'13"W), 11 July 1987, by IM Smith, IMS870083A • 2 \bigcirc from Catron County, Glenwood; Whitewater Picnic Area 8 km east of Rt. 180, (33°22'22"N, 108°50'50"W), 12 July 1987, by IM Smith, IMS870084 • 1 \bigcirc from Grant County, Gila River Recreation Area beside Rt. 15 at Grapevine Recreation Area north of Silver City, (33°11'11"N, 108°12'12"W), 11 July 1987, by IM Smith, IMS870082B.

Type deposition. Holotype (\mathcal{Q}) and allotype (\mathcal{S}) deposited in coll. Kurt Otto Viets, Senckenberg Museum Frankfurt, Germany.

Diagnosis. Torrenticola lamellipalpis are similar to other members of the Rala Group (*T. rala, T. keesdavidsi, T. boettgeri, T. kurtvietsi, T. dolichodactyla*, and *T. anoplopalpa*) by being colorless, having incomplete hind coxal margins and being distributed

Figure 123. *Torrenticola lamellipalpis* distribution. Blue star represents type locality (K.O. Viets 1977b); and red circles represent new records and material examined.

in the southwest. *T. lamellipalpis* can be differentiated from all other Rala Group by having a wide, prominent lamellate extension on the pedipalpal femora that extend to the genua (others either without extensions or with tuberculate or flanged, dentate extensions).

Re-description. FEMALE (Figure 124) (n = 5) with characters of the genus with following specifications.

Dorsum — (660–735 long; 425–490 wide) ovoid and colorless. Anterio-medial platelets (162.5–175 long; 55–57.5 wide). Anterio-lateral platelets (205–225 long; 65–75 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to

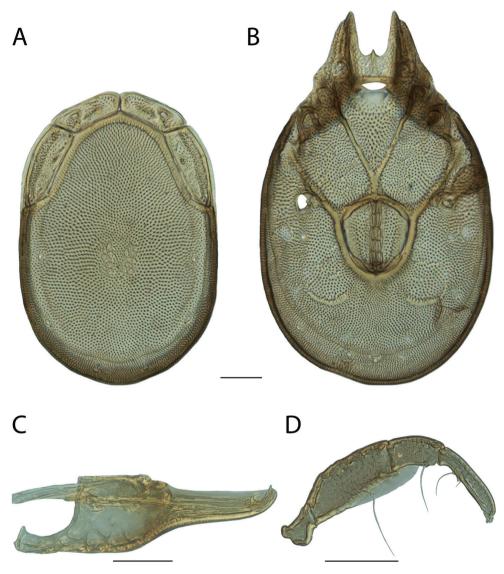

Figure 124. *Torrenticola lamellipalpis* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

the muscle scars (distance between Dgl-4 355–370). Dorsal plate proportions: dorsum length/width 1.46–1.60; dorsal width/distance between Dgl-4 1.20–1.32; anterio-medial platelet length/width 2.87–3.05; anterio-lateral platelet length/width 2.80–3.35; anterio-lateral/anterio-medial length 1.17–1.36.

Gnathosoma — Subcapitulum (440–465 long (ventral); 330–350 long (dorsal); 125–135 tall) colorless. Rostrum (175–187.5 long; 55–60 wide). Chelicerae (390–420

long) with curved fangs (60–65 long). Subcapitular proportions: ventral length/height 3.38–3.52; rostrum length/width 3.00–3.41. **Pedipalps** with wide, prominent lamellate extensions on femora that extends halfway into the genua. Palpomeres: trochanter (55–60 long); femur (145–152.5 long); genu (75–77.5 long); tibia (97.5–102.5 long; 22.5–23.75 wide); tarsus (17.5–20 long). Palpomere proportions: femur/genu 1.90–1.97; tibia/femur 0.66–0.69; tibia length/width 4.32–4.56.

Venter — (815–930 long; 500–560 wide) colorless. Gnathosomal bay (180–195 long; 80–100 wide). Cxgl-4 subapical. **Medial suture** (35–45 long). **Genital plates** (185–195 long; 155–165 wide). Additional measurements: Cx-1 (380–390 long (to-tal); 190–200 long (medial)); Cx-3 (350–365 wide); anterior venter (240–260 long). Ventral proportions: gnathosomal bay length/width 1.90–2.31; anterior venter/genital field length 1.23–1.38; anterior venter length/genital field width 1.48–1.65; anterior venter/medial suture 5.67–6.86.

MALE (Figure 125) (n = 4) with characters of the genus with following specifications.
Dorsum — (620–680 long; 400–460 wide) ovoid and colorless. Anterio-medial platelets (147.5–165 long; 52.5–57.5 wide). Anterio-lateral platelets (195–217.5 long; 70–77.5 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–360). Dorsal plate proportions: dorsum length/width 1.48–1.58; dorsal width/distance between Dgl-4 1.25–1.28; anterio-medial platelet length/width 2.69–3.04; anterio-lateral/anterio-medial length 1.28–1.32.

Gnathosoma — **Subcapitulum** (392.5–427.5 long (ventral); 292.5–325 long (dorsal); 112.5–127.5 tall) colorless. Rostrum (155–170 long; 50–55 wide). Chelicerae (350–390 long) with curved fangs (55–55 long). Subcapitular proportions: ventral length/height 3.29–3.56; rostrum length/width 3.09–3.24. **Pedipalps** with wide, prominent lamellate extensions on femora that extends halfway into the genua. Palpomeres: trochanter (51.25–55 long); femur (130–135 long); genu (70–77.5 long); tibia (97.5–105 long; 20–22.5 wide); tarsus (17.5–20 long). Palpomere proportions: femur/genu 1.74–1.86; tibia/femur 0.74–0.79; tibia length/width 4.67–4.94.

Venter — (780–840 long; 450–520 wide) colorless. Gnathosomal bay (170–195 long; 80–90 wide). Cxgl-4 subapical. **Medial suture** (110–130 long). **Genital plates** (160–180 long; 107.5–127.5 wide). Additional measurements: Cx-1 (335–370 long (total); 170–185 long (medial)); Cx-3 (325–375 wide); anterior venter (295–325 long). Ventral proportions: gnathosomal bay length/width 2.00–2.29; anterior venter/ genital field length 1.75–1.86; anterior venter length/genital field width 2.47–2.83; anterior venter/medial suture 2.42–2.83.

IMMATURES unknown.

Etymology. Viets (1977b) named the specific epithet (*lamellipalpis*) in reference to the "extensive ventral lamella" on the pedipalp femora (*lāmella*, L. small plate or flake; *palpus*, L. hand, feeler).

Distribution. Southwestern New Mexico (probably also found in southeastern Arizona), extending southward into Guatemala (Figure 123).

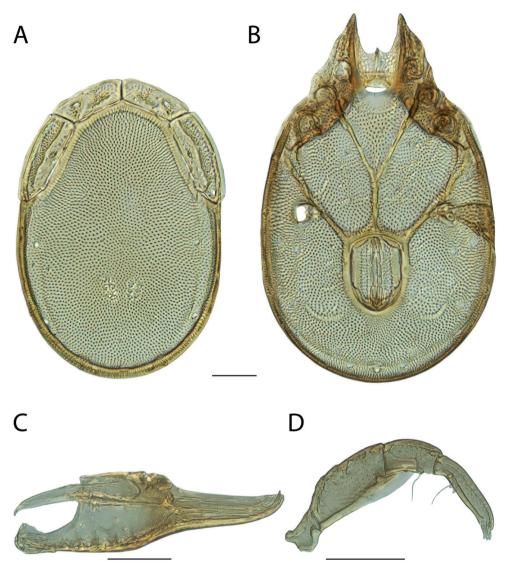

Figure 125. *Torrenticola lamellipalpis* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola lamellipalpis* and therefore this species is not included in our phylogenetic analyses. We were also unable to examine type material. However, we were able to examine new material from New Mexico. Based upon overall appearance, incomplete hind coxal margins, distribution, and lack of coloration, we were able to place this species within our concept of the Rala Identification Group.

Torrenticola larvata Cheri, Fisher, & Dowling, 2016

Material examined. HOLOTYPE (\bigcirc): USA, Arkansas, Polk Co., Bard Springs, Ouachita National Forest, Blaylock Creek (34°23'28.3"N, 94°00'31.8"W), 11 Aug 2009, by AJ Radwell and BG Crump, AJR090307B.

PARATYPES (5 \bigcirc ; 8 \checkmark): **Arkansas, USA**: 1 \checkmark (ALLOTYPE) from Polk County, Bard Springs, Ouachita National Forest, Blaylock Creek (34°23'28.3"N, 94°00'31.8"W), 11 Aug 2009, by AJ Radwell and BG Crump, AJR090307B • 3 \bigcirc from Polk County, beside Forest Road 38, North of Shady Lake Rec Area, East Saline Creek (34°22'53.4"N, 94°01'51.2"W), 30 Jul 2011, by IM Smith, IMS110041 • 1 \bigcirc and 6 \checkmark from Montgomery County, Ouachita National Forest, Ouachita River at Mcguire (34°22'53.4"N, 94°1'51.2"W), 27 Aug 2011, by AJ Radwell, AJR110307 • 1 \bigcirc and 1 \checkmark from Garland County, beside Route 7, 3 miles south of Mountain Valley, South Fork of Saline River (34°35'43.3"N, 93°00'45.3"W), 11 May 1977, by DR Cook, DRC770002 • 1 \checkmark from Montgomery County, Ouachita National Forest, Ouachita River at Pine Ridge (34°34'53.5"N, 93°53'00.9"W), 5 Oct 2007, by AJ Radwell and HW Robison, AJR070300A.

Type deposition. Holotype (\bigcirc), allotype (\eth), and most paratypes (3 \bigcirc ; 5 \circlearrowright) deposited in the CNC; other paratypes (2 \bigcirc ; 3 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola larvata are similar to other members of the Tricolor Complex (*T. bittikoferae*, *T. hoosieri*, *T. pearsoni*, *T. olliei*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, *T. unimaculata*, *T. cardia*, *T. kringi*, *T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. larvata* can be differentiated from all other *Torrenticola*, including other members of the Tricolor Complex, by having a distinct dorsal pattern. *T. larvata* can be further differentiated from *T. bittikoferae*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, *T. kringi*, and *T. mohawk* by being more elongate (length/width = 1.41–1.57 in *T. larvata*; 1.17–1.39 in others); and from *T. bittikoferae*, *T. olliei*, *T. sierrensis*, *T. trimaculata*, *T. unimaculata*, *T. dimorpha*, and *T. mohawk* by having a more elongate rostrum (length/width = 2.32–2.53 in *T. larvata*, 1.56–2.27 in others).

Re-description (amended from Cherri et al. 2016). FEMALE (Figure 127) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (650–725 (650) long; 450–475 (460) wide) ovoid and elongate with bluish-purple coloration restricted to the anterio-medial platelets and anterior-most portion of anterio-lateral platelets (rarely continuing to anterior border of the dorsal plate) and to the posterior dorsal plate within the area of primary sclerotization (posterior coloration is sometimes absent) with wide strip of orange medially. Anterio-medial platelets (127.5–132.5 (127.5) long; 175–190 (175) wide). Anterio-lateral platelets (175–190 (175) long; 70–77.5 (70) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 340–375 (340)). Dorsal plate proportions: dorsum length/width 1.41–1.54 (1.41); dorsal

Figure 126. Torrenticola larvata distribution.

width/distance between Dgl-4 1.27–1.35 (1.35); anterio-medial platelet length/width 1.83–2.04 (2.04); anterio-lateral platelet length/width 2.29–2.56 (2.50); anterio-lateral/anterio-medial length 1.37–1.43 (1.37).

Gnathosoma — **Subcapitulum** (275–287.5 (275) long (ventral); 200–211 (200) long (dorsal); 125–140 (125) tall) with bluish-purple coloration. Rostrum (110–117.5 (112.5) long; 47.5–50 (47.5) wide) short and conical. Chelicerae (260–295 (265) long) with curved fangs (53–62 (60) long). Subcapitular proportions: ventral length/ height 2.04–2.25 (2.20); rostrum length/width 2.32–2.42 (2.37). Pedipalps with tuberculate ventral extensions with dentate tips on femora and genua. Palpomeres: trochanter (40–42.5 (40) long); femur (105–107.5 (107.5) long); genu (67.5–72.5 (67.5) long); tibia (87.5–97.5 (90) long; 25–30 (26.25) wide); tarsus (25–27.5 (25) long). Palpomere proportions: femur/genu 1.48–1.59 (1.59); tibia/femur 0.81–0.91 (0.84); tibia length/width 3.25–3.50 (3.43).

Venter — (720–850 (795) long; 525–604 (525) wide) colorless or with bluishpurple coloration, but always with bold bluish-purple on the dorsal coxal area. Gnathosomal bay (117.5–140 (140) long; 77.5–92.5 (77.5) wide). Cxgl-4 subapical. **Medial suture** (25–35 (35) long). **Genital plates** (182.5–187.5 (185) long; 145–152.5 (150) wide). Additional measurements: Cx-1 (260–358.5 (260) long (total); 125–183 (125) long (medial)); Cx-3 (307–375 (325) wide); anterior venter (180–195 (180) long). Ventral proportions: gnathosomal bay length/width 1.31–1.81 (1.81); anterior

venter/genital field length 0.97–1.04 (0.97); anterior venter length/genital field width 1.20–1.31 (1.20); anterior venter/medial suture 5.14–7.80 (5.14).

MALE (Figure 128) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–610 (560) long; 350–400 (360) wide) ovoid and elongate with bluish-purple coloration restricted to the anterio-medial platelets and anterior-most portion of anterio-lateral platelets (rarely continuing to anterior border of the dorsal plate) and to the posterior dorsal plate within the area of primary sclerotization (pos-

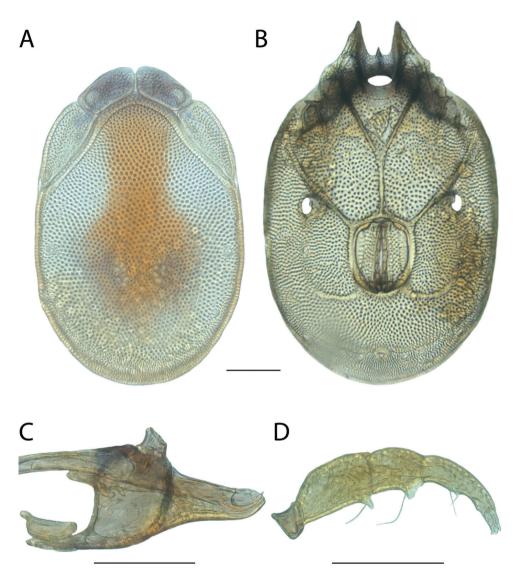

Figure 128. *Torrenticola larvata* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

terior coloration is sometimes absent) with wide strip of orange medially. Anteriomedial platelets (115–120 (120) long; 52.5–65 (55) wide). Anterio-lateral platelets (147.5–162.5 (155) long; 57.5–70 (70) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 285–340 (295)). Dorsal plate proportions: dorsum length/width 1.53–1.57 (1.56); dorsal width/distance between Dgl-4 1.18–1.26 (1.22); anterio-medial platelet length/ width 1.85–2.24 (2.18); anterio-lateral platelet length/width 2.21–2.83 (2.21); anterio-lateral/anterio-medial length 1.26–1.41 (1.29). **Gnathosoma** — **Subcapitulum** (230–247.5 (240) long (ventral); 167–182 (175) long (dorsal); 97.5–102.5 (100) tall) with bluish-purple coloration. Rostrum (91.25–100 (93.75) long; 37.5–40 (40) wide) short and conical. Chelicerae (221–239 (225) long) with curved fangs (45–52 (50) long). Subcapitular proportions: ventral length/ height 2.30–2.46 (2.40); rostrum length/width 2.34–2.53 (2.34). Pedipalps with tuberculate ventral extensions with dentate tips on femora and genua. Palpomeres: trochanter (32.5–37.5 (35) long); femur (85–95 (90) long); genu (56.25–62.5 (60) long); tibia (75–82.5 (80) long; 23.75–26.25 (25) wide); tarsus (22.5–26.25 (25) long). Palpomere proportions: femur/genu 1.48–1.61 (1.50); tibia/femur 0.82–0.89 (0.89); tibia length/width 3.10–3.20 (3.20).

Venter — (660–710 (680) long; 415–443 (420) wide) colorless or with bluishpurple coloration, but always with bold bluish-purple on the dorsal coxal area. Gnathosomal bay (112.5–130 (125) long; 65–70 (67.5) wide). Cxgl-4 subapical. **Medial suture** (102.5–125 (110) long). **Genital plates** (138.75–147.5 (140) long; 97.5–110 (110) wide). Additional measurements: Cx-1 (244–266 (250) long (total); 135–140 (140) long (medial)); Cx-3 (283–305 (295) wide); anterior venter (245–270 (260) long). Ventral proportions: gnathosomal bay length/width 1.67–1.94 (1.85); anterior venter/genital field length 1.77–1.89 (1.86); anterior venter length/genital field width 2.36–2.77 (2.36); anterior venter/medial suture 2.16–2.41 (2.36).

IMMATURES unknown.

Etymology. Cherri et al. (2016) named the specific epithet (*larvata*) for the anterior coloration that gives adults a masked appearance (*larvata*, L. masked).

Distribution. Ouachita Mountains of Arkansas (Figure 126).

Remarks. Torrenticola larvata groups with other members of the Tricolor Complex with high support in all analyses and specimens are less than 1% different in COI sequence from each other. In the combined analysis, *T. larvata* groups with *T. dimorpha* to form a clade sister to all other eastern members of this complex. These species are greater than 11% from each other. Based upon overall similarity, short conical rostrum, long pedipalp tibiae, phylogenetic position, and distribution, we were able to place this species in the Tricolor Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%), high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola leviathan Fisher & Dowling, sp. n. http://zoobank.org/2312DACD-A8B7-4759-BB7B-E5F1018BE665

Material examined. HOLOTYPE (♀): from USA, California, Mendocino County, beside Rt. 128 at Paul M. Dimmick Recreation Area, (39°10'10"N, 123°38'38"W), 4 August 1987, by IM Smith, IMS870127A

PARATYPES (3 \bigcirc ; 1 \circlearrowright): **California, USA**: 1 \circlearrowright (ALLOTYPE) from Mendocino, beside Rt. 128 at Paul M. Dimmick Recreation Area, (39°10'10"N, 123°38'38"W),

4 August 1987, by IM Smith, IMS870127A • $3 \ominus$ from Mendocino County, beside Rt. 128 at Paul M. Dimmick Recreation Area, (39°10'10"N, 123°38'38"W), 4 August 1987, by IM Smith, IMS870127A

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and some paratypes $(1 \bigcirc)$ deposited in the CNC; other paratypes $(1 \bigcirc)$ deposited in the ACUA.

Diagnosis. Torrenticola leviathan are similar to other members of the Ellipsoidalis Group (*T. multiforma, T. occidentalis,* and *T. ellipsoidalis*), in being among the largest Torrenticola in the west (dorsum length $\mathcal{Q} = 700-885$; $\mathcal{E} = 665-850$), although *T. sierrensis* are also large (dorsum length $\mathcal{Q} = 700-880$; $\mathcal{E} = 590-735$) but can easily be distinguished from the Ellipsoidalis Group by being circular instead of ellipsoid or rectangular (dorsum length/width = 1.17-1.28 in *T. sierrensis*, 1.30-1.67 in Ellipsoidalis Group). *T. leviathan* can be differentiated from all other Ellipsoidalis Group by having more elongate pedipalpal tibiae (length/width = 3.43-4.20 in *T. leviathan*, 2.64-3.33 in others).

Description. FEMALE (Figure 130) (n = 4) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (845–870 (870) long; 570–610 (580) wide) ellipsoid with faint orange coloration without a distinct pattern or colorless. Anterio-medial platelets (150– 155 (155) long; 70–80 (75) wide). Anterio-lateral platelets (240–260 (245) long; 95–105 (95) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than

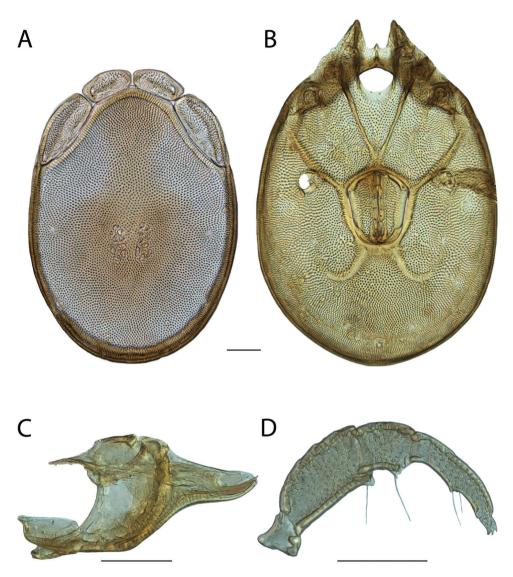

Figure 130. *Torrenticola leviathan* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

to the muscle scars (distance between Dgl-4 420–460 (425)). Dorsal plate proportions: dorsum length/width 1.40–1.51 (1.50); dorsal width/distance between Dgl-4 1.33–1.36 (1.36); anterio-medial platelet length/width 1.94–2.14 (2.07); anteriolateral platelet length/width 2.40–2.58 (2.58); anterio-lateral/anterio-medial length 1.55–1.70 (1.58).

Gnathosoma — **Subcapitulum** (330–350 (330) long (ventral); 230–230 (230) long (dorsal); 165–170 (170) tall) colorless. Rostrum (125–130 (125) long; 55–60 (55)

wide) short and conical. Chelicerae (335–340 (340) long) with curved fangs (80–85 (80) long). Subcapitular proportions: ventral length/height 2.00–2.06 (2.00); rostrum length/ width 2.17–2.27 (2.27). **Pedipalps** with short, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (50–52.5 (52.5) long); femur (130–130 (130) long); genu (75–77.5 (77.5) long); tibia (105–107.5 (107.5) long; 25–27.5 (27.5) wide); tarsus (20–22.5 (22.5) long). Palpomere proportions: femur/genu 1.68–1.73 (1.68); tibia/ femur 0.81–0.83 (0.83); tibia length/width 3.91–4.20 (3.91).

Venter — (970–1035 (1035) long; 640–680 (640) wide) colorless. Gnathosomal bay (190–215 (190) long; 85–100 (100) wide). Cxgl-4 subapical. **Medial suture** (25–30 (30) long). **Genital plates** (210–215 (210) long; 180–195 (180) wide). Additional measurements: Cx-1 (390–400 (390) long (total); 180–205 (205) long (medial)); Cx-3 (440–460 (440) wide); anterior venter (220–245 (245) long). Ventral proportions: gnathosomal bay length/width 1.90–2.53 (1.90); anterior venter/genital field length 1.05–1.17 (1.17); anterior venter length/genital field width 1.13–1.36 (1.36); anterior venter/medial suture 7.50–8.80 (8.17).

MALE (Figure 131) (n = 1) (allotype only) with characters of the genus with following specifications.

Dorsum — (770 long; 510 wide) ellipsoid with faint orange coloration without a distinct pattern or colorless. Anterio-medial platelets (140 long; 65 wide). Anterio-lateral platelets (230 long; 85 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 400). Dorsal plate proportions: dorsum length/width 1.51; dorsal width/distance between Dgl-4 1.28; anterio-medial platelet length/width 2.15; anterio-lateral platelet length/width 2.71; anterio-lateral/anterio-medial length 1.64.

Gnathosoma — **Subcapitulum** (285 long (ventral); 200 long (dorsal); 137.5 tall) colorless. Rostrum (95 long; 52.5 wide) short and conical. Chelicerae (275 long) with curved fangs (75 long). Subcapitular proportions: ventral length/height 2.07; rostrum length/width 1.81. **Pedipalps** with short, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5 long); femur (112.5 long); genu (70 long); tibia (90 long; 26.25 wide); tarsus (20 long). Palpomere proportions: femur/genu 1.61; tibia/femur 0.80; tibia length/width 3.43.

Venter — (860 long; 570 wide) colorless. Gnathosomal bay (180 long; 90 wide). Cxgl-4 subapical. **Medial suture** (110 long). **Genital plates** (160 long; 120 wide). Additional measurements: Cx-1 (360 long (total); 185 long (medial)); Cx-3 (420 wide); anterior venter (305 long). Ventral proportions: gnathosomal bay length/width 2.00; anterior venter/genital field length 1.91; anterior venter length/genital field width 2.54; anterior venter/medial suture 2.77.

IMMATURES unknown.

Etymology. Specific epithet (*leviathan*) refers to the large body size of this species, surpassed by few other *Torrenticola* (*liwyātān*, Hebrew, a large aquatic animal; noun in apposition). The Leviathan (modern spelling) is depicted in Jewish mythology (as written in the Tanakh) as one of two huge beasts—the Leviathan in the ocean and the Behemoth on land.

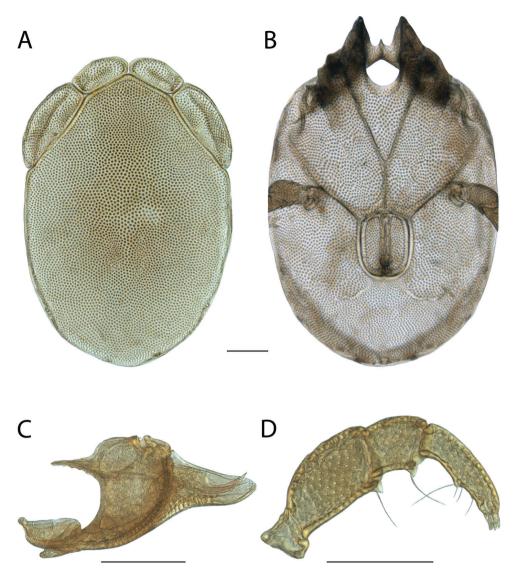

Figure 131. *Torrenticola leviathan* sp. n. male (teneral): **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Distribution. Northwestern California (Figure 129).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola leviathan* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, large size, and western distribution, places this species in the Miniforma Complex and the Ellipsoidalis Identification Group.

Torrenticola longitibia Fisher & Dowling, sp. n.

http://zoobank.org/BFF29739-A62F-498D-9F18-465D46964686

Material examined. HOLOTYPE (♂): from USA, Tennessee, Monroe County, beside Forest Route 35 (35°21'47"N, 84°9'47"W), 12 Sep 2009, by IM Smith, IMS090112, DNA 2979.

PARATYPES (0 \bigcirc ; 1 \circlearrowright): **Tennessee, USA**: 1 \circlearrowright from USA, Tennessee, Monroe County, beside Forest Route 35 (35°21'47"N, 84°9'47"W), 12 Sep 2009, by IM Smith, IMS090112.

Type deposition. Holotype (\bigcirc) deposited in the CNC; paratypes (1 \eth) deposited in the ACUA.

Diagnosis. *Torrenticola longitibia* are similar to other members of the Raptor Group (*T. gnoma, T. irapalpa, T. mjolniri, T. elusiva, T. racupalpa, T. raptor, T. danielleae, T. daemon,* and *T. ivyae*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. longitibia* can be differentiated from all other members of the Raptor Group (both males and females) by having a longer femur with respect to the genu (femur/genu = 2.1–2.17 in *T. longitibia,* 1.66–2.00 in others).

Description. FEMALE unknown.

MALE (Figure 133) (n = 2) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (530–560 (530) long; 420–430 (420) wide) circular with navy blue coloration posteriorly extending in a thin strip anteriorly to the edge of the dorsal plate. Anterio-medial platelets (122.5–132.5 (122.5) long; 62.5–72.5 (62.5) wide). Anterio-lateral platelets (172.5–180 (172.5) long; 78.75–80 (80) wide) free from dorsal plate. Dgl-4 much closer to the muscle scars than to the dorsum edge (distance between Dgl-4 155–175 (155)). Dorsal plate proportions: dorsum length/width 1.26–1.30 (1.26); dorsal width/distance between Dgl-4 2.46–2.71 (2.71); anterio-medial platelet length/width 1.83–1.96 (1.96); anterio-lateral platelet length/width 2.16–2.29 (2.16); anterio-lateral/anterio-medial length 1.36–1.41 (1.41).

Gnathosoma — **Subcapitulum** (300–315 (300) long (ventral); 235–245 (235) long (dorsal); 110–117.5 (110) tall) colorless. Rostrum (135–137.5 (135) long; 32.5–32.5 (32.5) wide) elongate. Chelicerae (325–325 (325) long) with curved fangs (50–50 (50) long). Subcapitular proportions: ventral length/height 2.68–2.73 (2.73); rostrum length/width 4.15–4.23 (4.15). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–45 (42.5) long); femur (125–131.25 (125) long); genu (57.5–62.5 (57.5) long); tibia (110–110 (110) long; 20–20 (20) wide); tarsus (15–15 (15) long). Palpomere proportions: femur/genu 2.10–2.17 (2.17); tibia/femur 0.84–0.88 (0.88); tibia length/width 5.50–5.50 (5.50).

Venter — (660–710 (660) long; 500–550 (500) wide) colorless. Gnathosomal bay (150–155 (150) long; 75–85 (85) wide). Cxgl-4 far from apex. **Medial suture**

Figure 132. Torrenticola longitibia sp. n. distribution.

 $(60-60 \ (60) \ \log)$. Genital plates $(137.5-150 \ (137.5) \ \log; 115-122.5 \ (115) \ wide)$. Additional measurements: Cx-1 $(270-300 \ (270) \ \log \ (total); 130-140 \ (130) \ \log \ (medial))$; Cx-3 $(320-325 \ (320) \ wide)$; anterior venter $(205-220 \ (205) \ \log)$. Ventral proportions: gnathosomal bay length/width $1.76-2.07 \ (1.76)$; anterior venter/genital field length $1.47-1.49 \ (1.49)$; anterior venter length/genital field width $1.78-1.80 \ (1.78)$; anterior venter/medial suture $3.42-3.67 \ (3.42)$.

IMMATURES unknown.

Etymology. Specific epithet (*longitibia*) refers to the long, thin pedipalpal tibiae (*longus*, L. long; *tibia*, L. tibia).

Distribution. Known only from Monroe County, Tennessee (Figure 132).

Remarks. Torrenticola longitibia is known only from two males, only one of which was available for molecular data and that specimen groups with other members of the Raptor Complex with high support. In all analyses, *T. longitibia* groups with *T. mjolni-ri*, and these species are more than 4% different in COI sequence from each other. The position of that clade varies with dataset. Based upon overall similarity, phylogenetic position, shape of the pedipalps, and distribution, we were able to place this species within the Raptor Identification Group.

This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Figure 134. Torrenticola magnexa distribution.

Type deposition. Holotype (\bigcirc) and allotype (\bigcirc) deposited in the CNC.

Diagnosis. Torrenticola magnexa are similar to other members of the Partial 2-Plate Group (*T. folkertsae, T. pulchra*, and *T. priapus*) in having anterio-lateral platelets partially fused to the dorsal plate and being distributed in the east. *T. magnexa* can be differentiated from other Partial 2-Plate Group by dorsal coloration and pattern. *T. magnexa* can be further differentiated from *T. New 23A* by having a less elongate rostrum (length/width = 2.25–3.00 in *T. magnexa*, 3.17–3.39 in *T. priapus*). *T. magnexa* can be further differentiated from *T. folkertsae* by having less elongate pedipalpal tibiae (length/width = 3.21–4.00 in *T. magnexa*, 4.05–4.83 in *T. folkertsae*). Male *T. magnexa* can be further differentiated from male *T. pulchra* by having a larger genital field (length \Diamond = 125–148 in *T. magnexa*, 110–123 in *T. pulchra*; width \Diamond = 115–125 in *T. magnexa*, 87–95 in *T. pulchra*) and more elongate pedipalpal tibiae (length/width \Diamond = 3.78–4.00 in *T. magnexa*, 3.00–3.35 in *T. pulchra*). Female *T. magnexa* can be differentiated from female *T. pulchra*) and longer pedipalpal tibiae (\bigcirc 170–188 in *T. magnexa*, 147–160 in *T. pulchra*) and longer pedipalpal tibiae (\bigcirc 102–113 in *T. magnexa*, 82–93 in *T. pulchra*).

Re-description. FEMALE (Figure 135) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (680–750 (750) long; 500–560 (560) wide) ovoid with bluish-purple or reddish-purple coloration separated into anterior and posterior portions with red medially. Anterio-medial platelets 155–170 (162.5) long; 57.5–65 (60) wide). Anter-

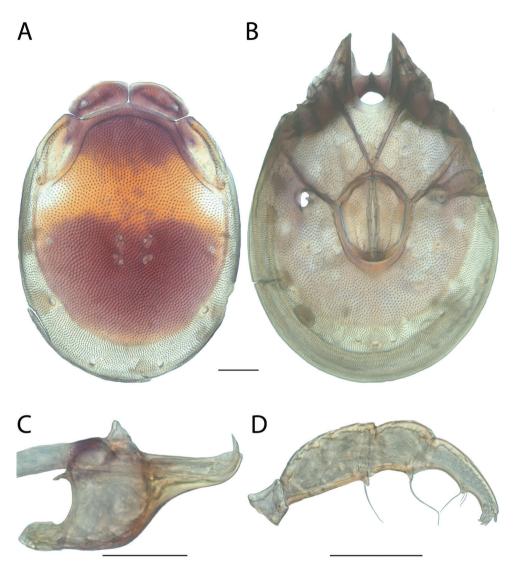

Figure 135. *Torrenticola magnexa* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

io-lateral platelets (192.5–210 (210) long; 72.5–85 (85) wide) partially fused to dorsal plate (especially posteriorly). Dgl-4 close to the edge of the dorsum (distance between Dgl-4 390–410 (400)). Dorsal plate proportions: dorsum length/width 1.28–1.42 (1.34); dorsal width/distance between Dgl-4 1.28–1.40 (1.40); anterio-medial platelet length/width 2.42–2.72 (2.71); anterio-lateral platelet length/width 2.47–2.71 (2.47); anterio-lateral/anterio-medial length 1.13–1.33 (1.29).

Gnathosoma — Subcapitulum (330–355 long (ventral); 251–277 long (dorsal); 150–170 tall) mostly colorless. Rostrum (137.5–150 long; 47.5–52.5 wide). Chelicer-

ae (335–363 long) with curved fangs (55–78 long). Subcapitular proportions: ventral length/height 2.00–2.37; rostrum length/width 2.75–3.00. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5–52.5 (50) long); femur (127.5–135 (135) long); genu (75–82.5 (80) long); tibia 102.5–107.5 (102.5) long; 26.25–30 (28.75) wide); tarsus (17.5–25 (22.5) long). Palpomere proportions: femur/genu 1.58–1.71 (1.69); tibia/femur 0.76–0.83 (0.76); tibia length/width 3.57–4.00 (3.57).

Venter — (770–900 (830) long; 588–672 (660) wide) colorless. Gnathosomal bay (165–190 (165) long; 95–125 (125) wide). Cxgl-4 subapical. **Medial suture** (0–15 (7.5) long) occasionally absent. **Genital plates** (190–207.5 (207.5) long; 170–187.5 (187.5) wide). Additional measurements: Cx-1 (299–359 (320) long (total); 96–155 (155) long (medial)); Cx-3 (369–455 (455) wide); anterior venter (167.5–175 (175) long). Ventral proportions: gnathosomal bay length/width 1.32–1.87 (1.32); anterior venter/genital field length 0.84–0.91 (0.84); anterior venter length/genital field width 0.93–1.03 (0.93); anterior venter/medial suture (proportion cannot be calculated for specimens without a medial suture) 11.33–23.33 (23.33).

MALE (Figure 136) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–630 (600) long; 390–450 (430) wide) ovoid with bluishpurple or reddish-purple coloration separated into anterior and posterior portions with red medially. Anterio-medial platelets (125–140 (132.5) long; 47.5–52.5 (50) wide). Anterio-lateral platelets (158.75–192.5 (170) long; 60–70 (60) wide) partially fused to dorsal plate (especially posteriorly). Dgl-4 close to the edge of the dorsum (distance between Dgl-4 310–350 (310)). Dorsal plate proportions: dorsum length/width 1.35–1.43 (1.40); dorsal width/distance between Dgl-4 1.26– 1.39 (1.39); anterio-medial platelet length/width 2.48–2.95 (2.65); anterio-lateral platelet length/width 2.44–2.85 (2.83); anterio-lateral/anterio-medial length 1.22– 1.43 (1.28).

Gnathosoma — **Subcapitulum** (272.5–300 (285) long (ventral); 200–229 (215) long (dorsal); 113–127.5 (122.5) tall) mostly colorless. Rostrum (110–122.5 (117.5) long; 40–45 (42.5) wide). Chelicerae (260–292 (290) long) with curved fangs (49–60 (55) long). Subcapitular proportions: ventral length/height 2.22–2.42 (2.33); rostrum length/width 2.59–2.84 (2.76). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–45 (40) long); femur (105–112.5 (110) long); genu (65–72.5 (67.5) long); tibia (85–97.5 (90) long; 22.5–25 (22.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.55–1.67 (1.63); tibia/femur 0.80–0.87 (0.82); tibia length/width 3.78–4.00 (4.00).

Venter — (640–770 (710) long; 465–550 (550) wide) colorless. Gnathosomal bay (127.5–160 (127.5) long; 77.5–95 (77.5) wide). Cxgl-4 subapical. **Medial suture** (62.5–85 (75) long). **Genital plates** (125–147.5 (140) long; 115–125 (115) wide). Additional measurements: Cx-1 (251–285 (270) long (total); 102–140 (140) long (medial)); Cx-3 (335–375 (375) wide); anterior venter (207.5–240 (220) long). Ventral proportions: gnathosomal bay length/width 1.37–1.94 (1.65); anterior venter/

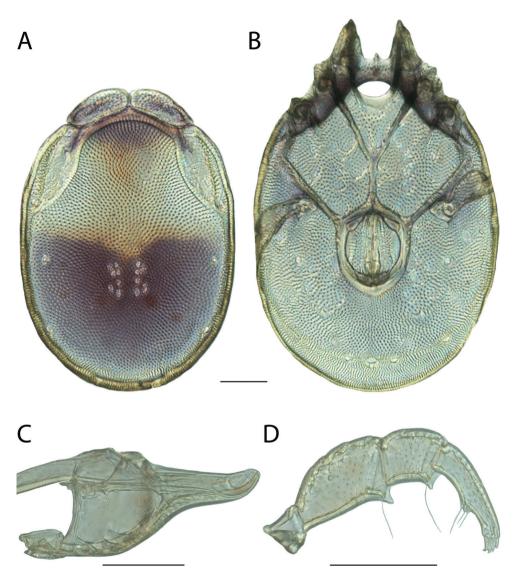

Figure 136. *Torrenticola magnexa* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

genital field length 1.57–1.78 (1.57); anterior venter length/genital field width 1.80–1.98 (1.91); anterior venter/medial suture 2.82–3.68 (2.93).

IMMATURES unknown.

Etymology. Habeeb (1957) did not specify an etymology for the specific epithet (*magnexa*). However, surely this name refers to the similarity of this species to the Palaearctic *T. connexa* (Koenike, 1908) (*néos*, G. new).

Distribution. Eastern (Figure 134).

Remarks. Upon examining the types of *T. magnexa* and *T. neoconnexa* Habeeb, 1957, all characters for both species overlap with members of only one clade in our analyses. Furthermore, the primary character Habeeb (1955, 1957, 1961) used to differentiate *T. magnexa* from *T. neoconnexa* was body size, which is known to be a highly variable character. Therefore, it is apparent that these represent the same species hypothesis and must be synonymized. We therefore synonymize *T. neoconnexa* as the junior synonym of *T. magnexa*.

In all analyses, *Torrenticola magnexa* groups with other members of the Rusetria Complex with high support, all specimens were less than 1% different in COI sequence from each other, and these specimens were 11–13% different from sister species. In the combined analysis, all eastern members of Rusetria Complex are monophyletic, and *T. magnexa* was recovered at the base of that eastern clade. Interestingly, most of the species within the more basal lineages of this eastern clade have lateral platelets that are free from the dorsal plate; whereas western species and most eastern species have lateral platelets fused to the dorsal plate. This is interesting because *T. magnexa*, which have lateral platelets partially fused to the dorsal plate, is recovered in an intermediate position between western species that have fused platelets and eastern species with unfused platelets.

Based upon the partially fused posterio-lateral platelets and the distribution, we place this species within the Partial 2-Plate Identification Group.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola malarkeyorum Fisher & Dowling, sp. n. http://zoobank.org/A736573D-3D5F-4BFD-8CA2-1C568BB7F8AA

Material examined. HOLOTYPE (\bigcirc): from USA, Missouri, Ozark County, Bryant Creek, downstream of Highway 95 bridge, 10 Sep 2011, by AJ Radwell, AJR110105A, DNA 2120.

Type deposition. Holotype (\bigcirc) , allotype (O), and most paratypes $(5 \bigcirc; 4 \textcircled{O})$ deposited in the CNC; other paratypes $(4 \heartsuit; 3 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola malarkeyorum are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. pen*dula, *T. sellersorum, T. tysoni, T. ululata, T. whitneyae, T. microbiscutella*, and *T. feminel*lai) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except *T. ululata* and *T. indistincta*), and being distributed in the east. *T. malarkeyorum* can have variable coloration, including light bluish purple and reddish purple. Although several other species are purplish, some *T. malarkeyorum* are easily recognizable because they have bluish-purple coloration similar to *T. tysoni* and *T. biscutella*, albeit much fainter than these species. *T.*

malarkeyorum can be differentiated from T. ululata, T. indistincta, and T. feminellai by dorsal coloration and pattern. T. malarkeyorum can be differentiated from T. tysoni by having a stockier rostrum (length/width = 2.57-2.89 in T. malarkeyorum, 3.06-3.5 in T. tysoni). Female T. malarkeyorum can be differentiated from female T. biscutella by having a longer subcapitulum (ventral length = 317.5-335 in T. malarkeyorum, 290-315 in T. biscutella). Male T. malarkeyorum can be differentiated from male T. biscutella by having a slightly more ovoid dorsum (length/width = 1.42–1.56 in T. malarkeyorum; 1.37-1.42 in T. biscutella. Additionally, although T. malarkeyorum and T. biscutella have the same dorsal coloration and pattern, often the coloration is faint in T. malarkeyorum and bold in T. biscutella. Female T. malarkeyorum can be differentiated from female *T. caerulea* by having a wider genital field (152.5–165 in *T. malarkeyorum*, 120-145 in T. caerulea). Additionally, T. malarkeyorum can be differentiated from T. caerulea by dorsal coloration and pattern. T. malarkeyorum can be differentiated from T. pendula by having a stockier gnathosomal bay (length/width = 1.62-2.26 in T. malarkeyorum, 2.42-2.90 in T. pendula); more elongate pedipalp tibiae (length/width = 3.22-3.60 in T. malarkeyorum, 2.78-3.05 in T. pendula); and by dorsal pattern. T. ma*larkeyorum* can be differentiated from *T. whitneyae* by having more elongate pedipalpal tibiae (length/width = 3.22-3.60 in T. malarkeyorum, 2.42-2.95 in T. whitneyae) and by anterior venter/genital field length (Q = 0.85-0.89 in *T. malarkeyorum*, 0.59-0.75 in T. whitneyae; $\bigcirc = 1.52 - 1.88$ in T. malarkeyorum, 1.37 - 1.43 in T. whitneyae). T. malarkeyorum can be differentiated from T. microbiscutella by having a less elongate dorsum (length/width = 1.33–1.56 in T. malarkeyorum, 1.63–1.75 in T. microbiscutella). Female T. malarkeyorum can be differentiated from female T. delicatexa by having a shorter genital field (162.5–170 in T. malarkeyorum, 175–198 in T. delicatexa). Female T. malarkeyorum can be differentiated from female T. sellersorum by anterior venter/ genital field length (0.85-0.89 in T. malarkeyorum, 0.69-0.77 in T. sellersorum). Male T. malarkeyorum do not have any measurement differences with male T. delicatexa, and T. sellersorum; however, they can be differentiated by dorsal coloration.

Description. FEMALE (Figure 138) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–640 (635) long; 425–470 (470) wide) ovoid with highly variable coloration, usually faint (occasionally bold) bluish-purple or reddish-purple separated into anterior and posterior portions, and with faint orange medially. Anteriomedial platelets (121.25–135 (132.5) long; 41.25–47.5 (45) wide). Anterio-lateral platelets (150–170 (170) long; 55–70 (70) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–335 (330)). Dorsal plate proportions: dorsum length/width 1.33–1.41 (1.35); dorsal width/distance between Dgl-4 1.27–1.44 (1.42); anterio-medial platelet length/ width 2.68–3.18 (2.94); anterio-lateral platelet length/width 2.38–2.73 (2.43); anterio-lateral/anterio-medial length 1.11–1.36 (1.28).

Gnathosoma — **Subcapitulum** (317.5–335 (335) long (ventral); 234–250 (250) long (dorsal); 135–155 (155) tall) colorless. Rostrum (123.75–130 (130) long; 45–47.5 (45) wide). Chelicerae (323.75–342.5 (342.5) long) with curved fangs (59–70)

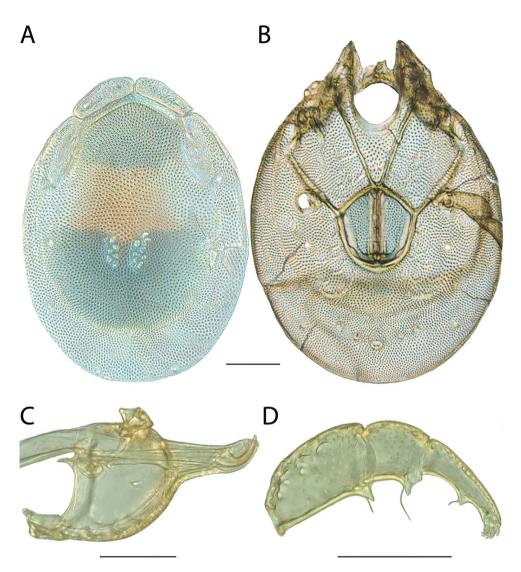

Figure 138. *Torrenticola malarkeyorum* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

(70) long). Subcapitular proportions: ventral length/height 2.13–2.35 (2.16); rostrum length/width 2.61–2.89 (2.89). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–50 (47.5) long); femur (115–123.75 (120) long); genu (67.5–72.5 (72.5) long); tibia (90–92.5 (90) long; 25–27.5 (27.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.62–1.71 (1.66); tibia/femur 0.73–0.80 (0.75); tibia length/width 3.27–3.60 (3.27).

Venter — (700–770 (760) long; 482–600 (600) wide) colorless (occasionally with faint bluish-purple coloration). Gnathosomal bay (165–182.5 (182.5) long; 97.5–110

(110) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (162.5–170 (170) long; 152.5–165 (165) wide). Additional measurements: Cx-1 (284–330 (330) long (total); 116–145 (145) long (medial)); Cx-3 (316–385 (385) wide); anterior venter (137.5–150 (150) long). Ventral proportions: gnathosomal bay length/width 1.65–1.82 (1.66); anterior venter/genital field length 0.85–0.89 (0.88); anterior venter length/genital field width 0.88–0.95 (0.91).

MALE (Figure 139) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (420–470 (470) long; 285–320 (320) wide) ovoid with highly variable coloration, usually faint (occasionally bold) bluish-purple or reddish-purple separated into anterior and posterior portions, and with faint orange medially. Anterio-medial platelets (92.5–110 (110) long; 32.5–37.5 (37.5) wide). Anterio-lateral platelets (117.5–127.5 (127.5) long; 45–52.5 (52.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 210–240 (240)). Dorsal plate proportions: dorsum length/width 1.42–1.56 (1.47); dorsal width/distance between Dgl-4 1.29–1.36 (1.33); anterio-medial platelet length/ width 2.80–3.15 (2.93); anterio-lateral platelet length/width 2.43–2.61 (2.43); anterio-lateral/anterio-medial length 1.12–1.32 (1.33).

Gnathosoma — **Subcapitulum** (227.5–240 (230) long (ventral); 162–180 (163) long (dorsal); 95–100 (100) tall) colorless. Rostrum (90–95 (92.5) long; 32.5–35 (35) wide). Chelicerae (212.5–230 long) with curved fangs (40–50 long). Subcapitular proportions: ventral length/height 2.28–2.53 (2.30); rostrum length/width 2.57–2.85 (2.64). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (32.5–40 (35) long); femur (76.25–87.5 (87.5) long); genu (52.5–55 (55) long); tibia (65–75 (75) long; 20–22.5 (22.5) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.39–1.62 (1.59); tibia/femur 0.76–0.92 (0.86); tibia length/width 3.22–3.50 (3.33).

Venter — (495–560 (560) long; 320–405 (396) wide) colorless (occasionally with faint bluish-purple coloration). Gnathosomal bay (97.5–130 (115) long; 55–65 (65) wide). Cxgl-4 subapical. **Medial suture** (65–72.5 (72.5) long). **Genital plates** (97.5–115 (110) long; 95–120 (105) wide). Additional measurements: Cx-1 (197.5–230 (230) long (total); 90–115 (107) long (medial)); Cx-3 (250–300 (295) wide); anterior venter (160–200 (200) long). Ventral proportions: gnathosomal bay length/width 1.62–2.26 (1.77); anterior venter/genital field length 1.52–1.88 (1.82); anterior venter length/genital field width 1.53–2.00 (1.90); anterior venter/medial suture 2.37–2.92 (2.76).

IMMATURES unknown.

Etymology. Specific epithet (*malarkeyorum*) named in honor of JRF's sister, Mayme Malarkey and her family—Andy, Jack, Molly, and Lucy—who are a constant joy to all whom they encounter.

Distribution. Eastern (Figure 137), especially highlands (Appalachians and Ozarks).

Remarks. *Torrenticola malarkeyorum* groups with other members of the Rusetria Complex with high support and all specimens are less than 2% different in COI sequence from each other. In all analyses, *T. malarkeyorum* groups with two other mor-

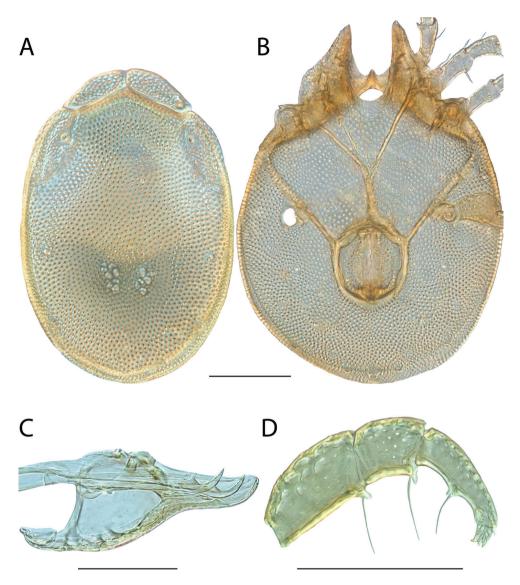

Figure 139. *Torrenticola malarkeyorum* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

phologically similar species: *T. biscutella* and *T. caerulea*. These three species are 3–5% different from each other in COI sequence. The three of these species are morphologically similar to the more distantly-related *T. delicatexa*.

Based upon overall similarity, dorso-lateral platelet fusion, and distribution, we were able to place this species within the Eastern 2-Plate Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (1 \bigcirc ; 2 \circlearrowright) deposited in the CNC; other paratypes (1 \bigcirc ; 2 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola manni are similar to members of the Miniforma group (T. copipalpa, T. miniforma, T. pacificensis, T. rockyensis, T. oliveri, and T. pinocchio) in having short, stocky pedipalps (except T. oliveri and T. pinocchio); similar pedipalpal extensions (unique to members of this group); and being among the smallest Torrenticola in the west (dorsum 500-625 long) (except T. oliveri). T. manni can be differentiated from all other Miniforma group by being from the southwest (all others are from the northwest or Rocky Mountains). T. manni are best differentiated from *T. rockyensis* by having more elongate pedipalp tibiae (length/width = 3.13-3.38 in *T.* manni, 2.47-3.11 in T. rockyensis). T. manni are best differentiated from T. copipalpa by having tuberculate pedipalp femoral extensions (broad and flat in *T. copipalpa*). T. manni are best differentiated from T. pacificensis by having more elongate tibiae (length/width = 3.24-3.38 in T. manni, 2.67-3.00 in T. pacificensis); having more elongate subcapitular rostra (length/width Q = 3.00-3.13 in *T. manni*, 2.59–2.68 in *T.* pacificensis; d = 3.13-3.20 in T. manni, 2.76-3.07 in T. pacificensis). T. manni are best differentiated from *T. miniforma* by being larger (dorsum length Q = 565-620 in *T.* manni, 545 in T. miniforma; a = 535–550 in T. manni, 485 in T. miniforma) and having more elongate pedipalp tibiae (length/width = 3.13-3.38 in T. manni, 2.38-2.88 in T. miniforma). T. manni can be differentiated from T. oliveri by having a shorter anterior venter (192-230 in T. manni, 250-310 in T. oliveri) and less elongate pedipalpal tibiae (length/width = 3.13-3.38 in T. manni, 3.68-4.13 in T. oliveri). T. manni can be differentiated from *T. pinocchio* by having a less elongate rostrum (length/width = 3.0-3.2 in T. manni, 4.5-4.9 in T. pinocchio) and a more ovoid dorsum (length/width = 1.25–1.36 in *T. manni*, 1.53–1.64 in *T. pinocchio*).

Description. FEMALE (Figure 141) (n = 3) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (565–620 (620) long; 390–450 (450) wide) ovoid with faint purple coloration restricted posteriorly. Anterio-medial platelets (110–125 (125) long; 52.5–56.25 (56.25) wide). Anterio-lateral platelets (170–182.5 (182.5) long; 62.5–70 (70) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the mus-

Figure 140. Torrenticola manni sp. n. distribution.

cle scars (distance between Dgl-4 295–335 (335)). Dorsal plate proportions: dorsum length/width 1.38–1.45 (1.38); dorsal width/distance between Dgl-4 1.32–1.36 (1.34); anterio-medial platelet length/width 2.10–2.22 (2.22); anterio-lateral platelet length/ width 2.61–2.81 (2.61); anterio-lateral/anterio-medial length 1.46–1.55 (1.46).

Gnathosoma — **Subcapitulum** (305–337.5 (337.5) long (ventral); 225–255 (255) long (dorsal); 110–121.25 (121.25) tall) colorless. Rostrum (125–140 (140) long; 40–45 (45) wide). Chelicerae (305–332 (332) long) with curved fangs (50–64 (57) long). Subcapitular proportions: ventral length/height 2.77–2.82 (2.78); rostrum length/ width 3.00–3.11 (3.11). **Pedipalps** short and stocky (especially tibiae) with broadly tuberculate ventral extensions with dentate tip on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (30–35 (35) long); femur (95–102.5 (102.5) long); genu (65–72.5 (72.5) long); tibia (62.5–70 (68.75) long; 20–21.25 (21.25) wide); tarsus (15–16.25 (16.25) long). Palpomere proportions: femur/genu 1.41–1.46 (1.41); tibia/femur 0.66–0.68 (0.67); tibia length/width 3.13–3.29 (3.24).

Venter — (700–780 (780) long; 458–477 (477) wide) colorless. Gnathosomal bay (142.5–150 (150) long; 60–70 (70) wide). Cxgl-4 subapical. **Medial suture** (45–50 (45) long). **Genital plates** (180–192.5 (192.5) long; 160–180 (180) wide). Additional measurements: Cx-1 (255–281 (275) long (total); 120–134 (131) long (medial)); Cx-3 (290–307 (307) wide); anterior venter (192.5–202.5 (202.5) long). Ventral proportions: gnathosomal bay length/width 2.11–2.38 (2.14); anterior venter/genital field

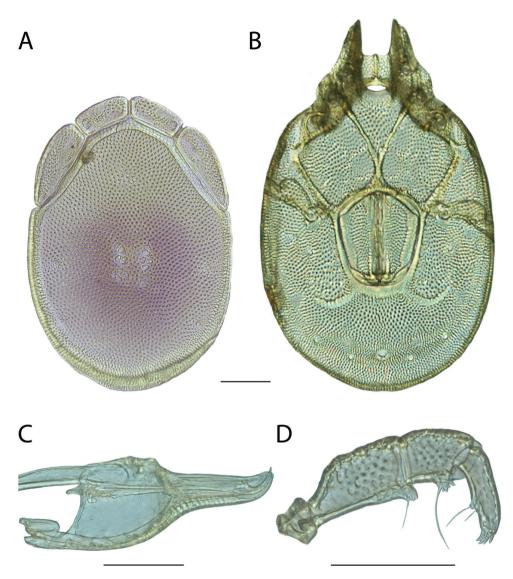

Figure 141. *Torrenticola manni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

length 1.05–1.07 (1.05); anterior venter length/genital field width 1.13–1.23 (1.13); anterior venter/medial suture 3.85–4.50 (4.50).

MALE (Figure 142) (n = 4) (allotypic measurements in parentheses when available)) with characters of the genus with following specifications.

Dorsum — (535–550 (545) long; 375–400 (390) wide) ovoid with faint purple coloration restricted posteriorly. Anterio-medial platelets (105–112.5 (112.5) long; 50–52.5 (52.5) wide). Anterio-lateral platelets (157.5–175 (167.5) long; 62.5–65 (65)

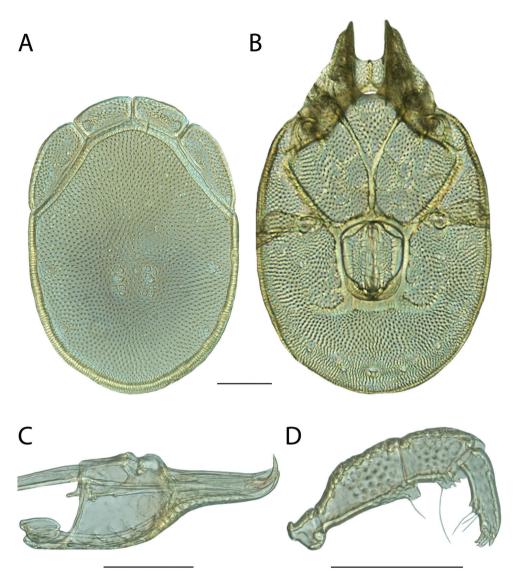

Figure 142. *Torrenticola manni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between Dgl-4 300–305 (305)). Dorsal plate proportions: dorsum length/width 1.34–1.47 (1.40); dorsal width/distance between Dgl-4 1.25–1.33 (1.28); anterio-medial platelet length/width 2.00–2.15 (2.14); anterio-lateral platelet length/ width 2.52–2.80 (2.58); anterio-lateral/anterio-medial length 1.49–1.58 (1.49).

Gnathosoma — **Subcapitulum** (290–305 (297.5) long (ventral); 220–230 (227.5) long (dorsal); 100–110 (107.5) tall) colorless. Rostrum (120–127.5 (127.5)

long; 37.5–40 (40) wide). Chelicerae (285–305 (300) long) with curved fangs (45–50 (46) long). Subcapitular proportions: ventral length/height 2.73–2.90 (2.77); rostrum length/width 3.13–3.20 (3.19). **Pedipalps** short and stocky (especially tibiae) with broadly tuberculate ventral extensions with dentate tip on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (27.5–32.5 (32.5) long); femur (87.5–97.5 (92.5) long); genu (60–65 (65) long); tibia (62.5–67.5 (67.5) long; 18.75–20 (20) wide); tarsus (13.75–15 (15) long). Palpomere proportions: femur/genu 1.40–1.50 (1.42); tibia/femur 0.65–0.73 (0.73); tibia length/width 3.19–3.38 (3.38).

Venter — (665–695 (695) long; 424.75–490 (424.75) wide) colorless. Gnathosomal bay (115–147.5 (140) long; 55–62.5 (62.5) wide). Cxgl-4 subapical. **Medial suture** (87.5–90 (87.5) long). **Genital plates** (140–150 (150) long; 112.5–116.25 (116.25) wide). Additional measurements: Cx-1 (240–272 (272) long (total); 115–125 (122) long (medial)); Cx-3 (275–315 (278) wide); anterior venter (220–230 (230) long). Ventral proportions: gnathosomal bay length/width 1.92–2.68 (2.24); anterior venter/genital field length 1.52–1.58 (1.53); anterior venter length/genital field width 1.91–1.98 (1.98); anterior venter/medial suture 2.44–2.63 (2.63).

IMMATURES unknown.

Etymology. Specific epithet (*manni*) named in honor of author Charles Mann, whose books about the peopling of North America (e.g., *1491*, *1493*) breach history and venture into human ecology. They are an inspiration to confronting misconceptions and a reminder that even seemingly well-known history, whether archeological or evolutionary, is in fact usually not well-known. His books are a battle cry to never cease learning and to always question.

Distribution. Known only from Catron County, New Mexico (Figure 140).

Remarks. *Torrenticola manni* groups with other members of the Miniforma Complex with high support and specimens of this species are less than 1% different in COI sequence from each other. In all analyses, *T. manni* groups with three other morphologically-similar species with high support: *T. pacificensis, T. copipalpa,* and *T. rockyensis.* These species are greater than 4% different from each other in COI sequence. These four species show a higher degree of biogeographic partitioning than most *Torrenticola.*

Based upon overall similarity, the pedipalp genu extensions, and western distribution, we were able to place this species in the Miniforma Identification Group.

This species hypothesis is supported by non-overlapping distribution, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola microbiscutella Fisher & Dowling, sp. n. http://zoobank.org/BA913F73-B71D-4219-9072-71A89B599018

Material examined. HOLOTYPE (\bigcirc): from USA, Georgia, White County, Helen; beside Road to Anna Ruby Falls just north of Unicoi State Park, (34°44'44"N, 83°43'43"W), 24 September 1992, by IM Smith, IMS920051.

Figure 143. Torrenticola microbiscutella sp. n. distribution.

PARATYPES (5 \bigcirc ; 6 \bigcirc): **Georgia, USA**: 1 \bigcirc (ALLOTYPE) from White County, Helen; beside Road to Anna Ruby Falls just north of Unicoi State Park, (34°44'44"N, 83°43'43"W), 24 September 1992, by IM Smith, IMS920051 • 3 \bigcirc and 4 \bigcirc from White County, Helen; beside Road to Anna Ruby Falls just north of Unicoi State Park, (34°44'44"N, 83°43'43"W), 24 September 1992, by IM Smith, IMS920051 • North Carolina, USA: • 2 \bigcirc and 2 \bigcirc from Macon County, Rainbow Springs; beside Forest Route 67, 2.0 km south of road to Standing Indian Campground, (35°3'3"N, 83°31'31"W), 1 July 1990, by IM Smith, IMS900072.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(3 \bigcirc; 3 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola microbiscutella are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malar-keyorum, T. pendula, T. sellersorum, T. tysoni, T. ululata, T. whitneyae*, and *T. feminellai*) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except *T. ululata* and *T. indistincta*), and being distributed in the east. *T. microbiscutella* can be differentiated from all other Eastern 2-Plates by having an elongate dorsum (length/width = 1.63–1.75 in *T. microbiscutella*, 1.21–1.56 in others). *T. microbiscutella* can be differentiated from most other Eastern 2-Plates by having faint dorsal coloration (most other Eastern 2-Plates have bold coloration).

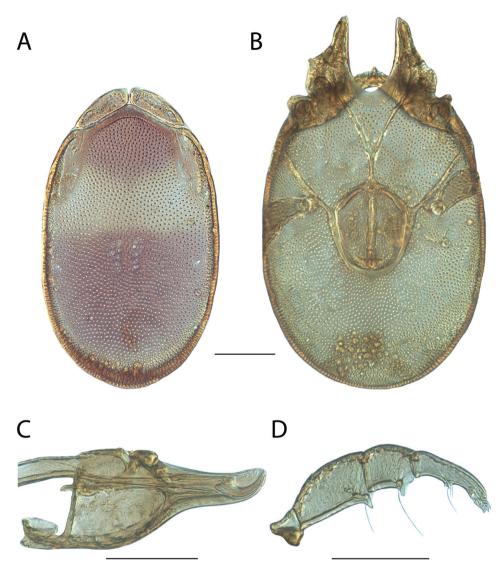

Figure 144. *Torrenticola microbiscutella* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Description. FEMALE (Figure 144) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (490–540 (510) long; 290–325 (300) wide) ovoid and elongate with faint reddish-purple coloration separated into anterior and posterior portions. Anterio-medial platelets (105–112.5 (110) long; 32.5–36.25 (33.75) wide). Anterio-lateral platelets (130–147.5 (135) long; 35–45 (45) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 235–250 (235)). Dorsal plate proportions: dorsum length/width 1.65–1.75 (1.70); dorsal width/distance between Dgl-4 1.23–1.30 (1.28); anterio-medial platelet length/ width 3.00–3.46 (3.26); anterio-lateral platelet length/width 3.00–3.79 (3.00); anter-io-lateral/anterio-medial length 1.20–1.34 (1.23).

Gnathosoma — **Subcapitulum** (260–270 (270) long (ventral); 195–210 (210) long (dorsal); 105–110 (107.5) tall) colorless. Rostrum (102.5–107.5 (107.5) long; 40–42.5 (42.5) wide) conical. Chelicerae (255–265 (262.5) long) with curved fangs (55–55 (55) long). Subcapitular proportions: ventral length/height 2.45–2.57 (2.51); rostrum length/width 2.53–2.63 (2.53). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–37.5 (37.5) long); femur (92.5–97.5 (97.5) long); genu (55–60 (57.5) long); tibia (72.5–80 (75) long; 20–22.5 (21.25) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.57–1.70 (1.70); tibia/femur 0.77–0.84 (0.77); tibia length/width 3.53–3.65 (3.53).

Venter — (610–660 (620) long; 335–370 (370) wide) colorless. Gnathosomal bay (120–142.5 (120) long; 65–75 (75) wide). Cxgl-4 subapical. **Medial suture** (42.5–50 (45) long). **Genital plates** (135–150 (145) long; 117.5–125 (120) wide). Additional measurements: Cx-1 (220–240 (230) long (total); 95–105 (105) long (medial)); Cx-3 (235–270 (270) wide); anterior venter (150–160 (157.5) long). Ventral proportions: gnathosomal bay length/width 1.60–2.04 (1.60); anterior venter/genital field length 1.07–1.15 (1.09); anterior venter length/genital field width 1.25–1.33 (1.31); anterior venter/medial suture 3.10–3.76 (3.50).

MALE (Figure 145) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (430–455 (440) long; 260–280 (260) wide) ovoid and elongate with faint reddish-purple coloration separated into anterior and posterior portions. Anteriomedial platelets (82.5–101.25 (95) long; 31.25–35 (35) wide). Anterio-lateral platelets (115–127.5 (115) long; 35–40 (37.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 205–215 (205)). Dorsal plate proportions: dorsum length/width 1.63–1.69 (1.69); dorsal width/distance between Dgl-4 1.21–1.30 (1.27); anterio-medial platelet length/width 2.64–3.12 (2.71); anterio-lateral platelet length/width 3.07–3.64 (3.07); anterio-lateral platelet eral/anterio-medial length 1.21–1.45 (1.21).

Gnathosoma — **Subcapitulum** (215–235 (232.5) long (ventral); 162.5–177.5 (176.25) long (dorsal); 77.5–90 (87.5) tall) colorless. Rostrum (82.5–95 (92.5) long; 30–36.25 (35) wide) conical. Chelicerae (197.5–232.5 (212.5) long) with curved fangs (45–47.5 (47.5) long). Subcapitular proportions: ventral length/height 2.58–2.77 (2.66); rostrum length/width 2.62–2.85 (2.64). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (30–32.5 (32.5) long); femur (75–81.25 (76.25) long); genu (50–53.75 (50) long); tibia (66.25–70 (67.5) long; 18.75–20 (20) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.50–1.60 (1.53); tibia/femur 0.84–0.90 (0.89); tibia length/width 3.31–3.60 (3.38).

Venter — (530–575 (540) long; 270–310 (305) colorless. Gnathosomal bay (110–125 (110) long; 55–60 (60) wide). Cxgl-4 subapical. **Medial suture** (75–90

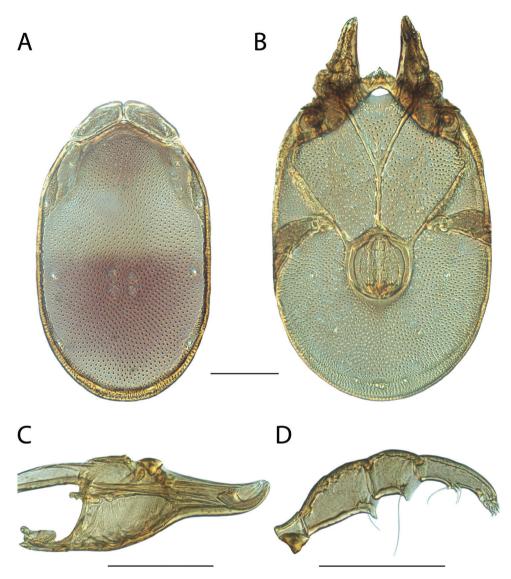

Figure 145. *Torrenticola microbiscutella* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

(90) long). **Genital plates** (85–95 (90) long; 85–100 (85) wide). Additional measurements: Cx-1 (200–220 (205) long (total); 95–100 (100) long (medial)); Cx-3 (220–240 (240) wide); anterior venter (185–195 (195) long). Ventral proportions: gnathosomal bay length/width 1.83–2.18 (1.83); anterior venter/genital field length 2.00–2.29 (2.17); anterior venter length/genital field width 1.95–2.29 (2.29); anterior venter/medial suture 2.17–2.47 (2.17).

IMMATURES unknown.

Etymology. Specific epithet (*microbiscutella*) is named because this species is the smallest (at least in females) and most elongate of all members of the Rusetria Complex (*mikrós*, G. small; *bi*, L. two; *scutella*, L. little plate).

Distribution. Southern Appalachians (Figure 143).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola microbiscutella* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution in the east, and fusion of the dorso-lateral platelets to the dorsal plate, are consistent with placing this species in the Rusetria Complex and Eastern 2-Plate Identification Group.

Torrenticola miniforma Habeeb, 1974

Torrenticola miniforma Habeeb, 1974: 1.

Material examined. LECTOTYPE $(1 \ Q)$: from USA, California, Humboldt County, Prairie Creek Redwoods State Park, Prairie Creek, 12 Jul 1964, by H Habeeb, HH640021.

PARALECTOTYPE (1 3): from USA, California, Humboldt County, Prairie Creek Redwoods State Park, Prairie Creek, 12 Jul 1964, by H Habeeb, HH640021.

Type deposition. Types $(1 \ \bigcirc; 1 \ \circlearrowleft)$ deposited in the CNC.

Diagnosis. Torrenticola miniforma are similar to members of the Miniforma group (T. copipalpa, T. manni, T. pacificensis, T. rockyensis, T. oliveri, and T. pinocchio) in having short, stocky pedipalps (except T. oliveri and T. pinocchio); similar pedipalpal extensions (unique to members of this group); and being among the smallest Torrenticola in the west (dorsum 500-625 long) (except T. oliveri). T. miniforma are best differentiated from T. rockyensis by being smaller (dorsum length Q = 545 in T. miniforma, 570–620 in T. rockyensis; 3 = 485 in T. miniforma, 525–545 in T. rockyen*sis*); having more elongate subcapitular rostra (length/width $\mathcal{Q} = 3.13$ in *T. miniforma*, 2.72–2.91 in T. rockyensis; $\mathcal{J} = 3.19$ in T. miniforma, 2.83–3.00 in T. rockyensis); and by being only known from Humboldt County, California, whereas T. rockyensis is distributed in the Rocky Mountains (Idaho & Montana). T. miniforma are best differentiated from T. copipalpa by having tuberculate pedipalp femoral extensions (broad and flat in T. copipalpa). T. miniforma are best differentiated from T. pacificensis by having more elongate anterio-medial platelets (length/width = 2.44–2.65 in T. miniforma, 2.00-2.16 in T. pacificensis); more elongate subcapitular rostra (length/width = 3.13–3.19 in T. miniforma, 2.59–3.07 in T. pacificensis); and by being only known from Humboldt County, California, whereas T. pacificensis is distributed in the Pacific Coast Ranges of Washington and Oregon. T. miniforma are best differentiated from *T. manni* by being smaller (dorsum length $\mathcal{Q} = 545$ in *T. miniforma*, 565–620 in *T. manni*; $\mathcal{J} = 485$ in *T. miniforma*, 535–550 in *T. manni*); having stockier pedipalp tibiae (length/width = 2.38–2.88 in T. miniforma, 3.13–3.38 in T. manni); and by being only known from Humboldt County, California, whereas T. manni is only

Figure 146. Torrenticola miniforma distribution.

known from Catron County, New Mexico. *T. miniforma* can be differentiated from *T. oliveri* by having a shorter anterior venter (172–200 in *T. miniforma*, 250–310 in *T. oliveri*) and having less elongate pedipalpal tibiae (length/width = 2.3–2.9 in *T. miniforma*, 3.6–4.2 in *T. oliveri*). *T. miniforma* can be differentiated from *T. pinocchio* by having a less elongate rostrum (length/width = 3.1–3.2 in *T. miniforma*, 4.5–4.9 in *T. pinocchio*) and a more ovoid dorsum (length/width = 1.43–1.43 in *T. miniforma*, 1.53–1.64 in *T. pinocchio*).

Re-description. FEMALE (Figure 147) (n = 1) (lectotype only) with characters of the genus with following specifications.

Dorsum — (545 long; 380 wide) ovoid and colorless. Anterio-medial platelets (112.5 long; 42.5 wide). Anterio-lateral platelets (152.5 long; 50 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 300). Dorsal plate proportions: dorsum length/width 1.43; dorsal width/distance between Dgl-4 1.27; anterio-medial platelet length/width 2.65; anterio-lateral platelet length/width 3.05; anterio-lateral/anterio-medial length 1.36.

Gnathosoma — **Subcapitulum** (295 long (ventral); 225 long (dorsal); 112.5 tall) colorless. Rostrum (117.5 long; 37.5 wide). Chelicerae (290 long) with curved fangs (52.5 long). Subcapitular proportions: ventral length/height 2.62; rostrum length/ width 3.13. **Pedipalps** short and stocky (especially tibiae) with tuberculate ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (32.5 long); femur (90 long); genu (62.5 long); tibia (57.5 long; 20 wide);

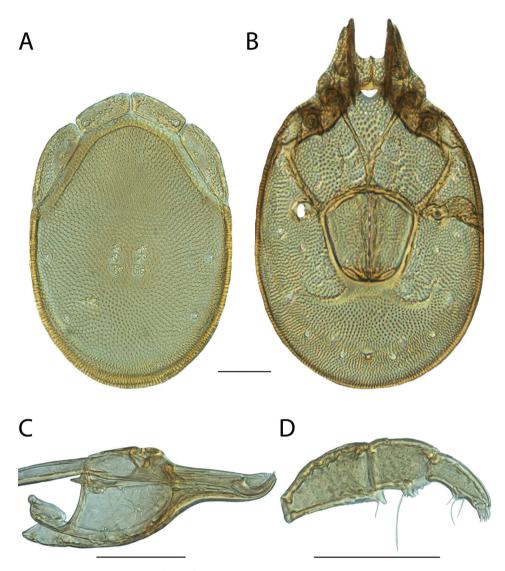

Figure 147. *Torrenticola miniforma* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

tarsus (15 long). Palpomere proportions: femur/genu 1.44; tibia/femur 0.64; tibia length/width 2.88.

Venter — (680 long; 420 wide) colorless. Gnathosomal bay (145 long; 62.5 wide). Cxgl-4 subapical. **Medial suture** (50 long). **Genital plates** (167.5 long; 165 wide). Additional measurements: Cx-1 (260 long (total); 50 long (medial)); Cx-3 (280 wide); anterior venter (172.5 long). Ventral proportions: gnathosomal bay length/width 2.32; anterior venter/genital field length 1.03; anterior venter length/genital field width 1.05; anterior venter/medial suture 3.45.

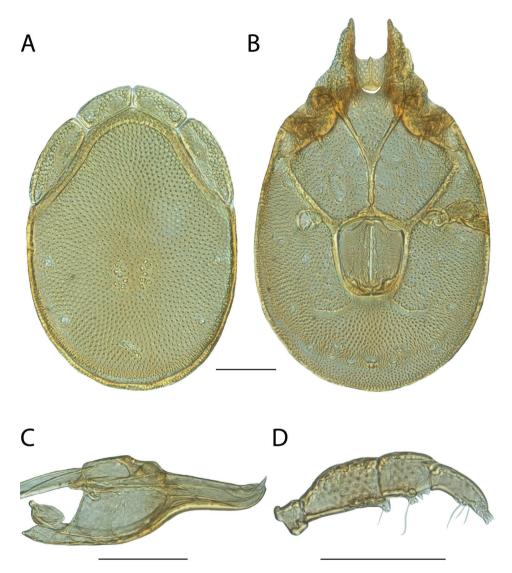

Figure 148. *Torrenticola miniforma* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

MALE (Figure 148) (n = 1) (paralectotype only) with characters of the genus with following specifications.

Dorsum — (485 long; 340 wide) ovoid and colorless. Anterio-medial platelets (97.5 long; 40 wide). Anterio-lateral platelets (145 long; 47.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 270). Dorsal plate proportions: dorsum length/width 1.43; dorsal width/distance between Dgl-4 1.26; anterio-medial platelet length/width 2.44; anter-io-lateral platelet length/width 3.05; anterio-lateral/anterio-medial length 1.49.

Gnathosoma — **Subcapitulum** (265 long (ventral); 200 long (dorsal); 95 tall) colorless. Rostrum (107.5 long; 33.75 wide). Chelicerae (265 long) with curved fangs (47.5 long). Subcapitular proportions: ventral length/height 2.79; rostrum length/ width 3.19. **Pedipalps** short and stocky (especially tibiae) with tuberculate ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (30 long); femur (77.5 long); genu (52.5 long); tibia (47.5 long; 20 wide); tarsus (15 long). Palpomere proportions: femur/genu 1.48; tibia/femur 0.61; tibia length/width 2.38.

Venter — (610 long; 380 wide) colorless. Gnathosomal bay (125 long; 50 wide). Cxgl-4 subapical. **Medial suture** (87.5 long). **Genital plates** (125 long; 50 wide). Additional measurements: Cx-1 (227.5 long (total); 102.5 long (medial)); Cx-3 (250 wide); anterior venter (200 long). Ventral proportions: gnathosomal bay length/width 2.50; anterior venter/genital field length 1.54; anterior venter length/genital field width 1.86; anterior venter/medial suture 2.29.

IMMATURES unknown.

Etymology. Habeeb (1974) did not specify an etymology for the specific epithet (*miniforma*). However, we suspect the specific epithet refers to the small body size of this species, as with others of the Miniforma Group (*minor*, L. small; *forma*, L. form), as Habeeb (1974) notes this species is "the smallest species that has come to the attention of the writer from the pacific area."

Distribution. Known only from Prairie Creek, Humboldt County, California (Habeeb 1974) (Figure 146).

Remarks. Unfortunately, we were unable to acquire more specimens of *Torrenticola miniforma* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with the type material. Based upon overall similarity, the pedipalp genu extensions, and western distribution, we were able to place this species in the Miniforma Complex and the Miniforma Identification Group.

Torrenticola mjolniri Fisher & Dowling, sp. n. http://zoobank.org/E5E69529-22FE-4357-9FD8-7B96FD917A16

Material examined. HOLOTYPE (Q): from Canada, Ontario, Hastings County, Maple Leaf, Papineau Creek, beside Hwy 62, 18 Aug 2011, by IM Smith, IMS110054, DNA 2860.

PARATYPES (12 \bigcirc ; 12 \eth): **Maine, USA**: 1 \bigcirc and 1 \circlearrowright from Kennebec County, China, beside Causeway along northern shore of China Lake (44°28'45"N, 69°30'43"W), 16 Sep 2003, by IM Smith, IMS030037 • **Ontario, Canada**: 1 \circlearrowright from Frontenac County, Salmon River, beside Highway 7 north of Arden, 26-28 Aug 1982, by IM Smith, CJ Hill, & C Cramer, IMS820005 • 1 \circlearrowright from Hastings County, Duff Corners, Vanderwater Conservation (44°23'14"N, 77°19'1"W), 13 Aug 2009, by IM Smith & ML MacKenzie, IMS090089A • 1 \circlearrowright (ALLOTYPE) from Hastings County, Maple Leaf, Papineau Creek, beside Hwy 62, 18 Aug 2011, by IM Smith,

Figure 149. Torrenticola mjolniri sp. n. distribution.

IMS110054, DNA 2857 • 1 \bigcirc and 1 \bigcirc from Hastings County, Maple Leaf, Papineau Creek, beside Hwy 62, 18 Aug 2011, by IM Smith, IMS110054 • 6 \bigcirc and 5 \oslash from Hastings County, Maynooth, Papineau Creek, beside Highway 127, 17 Aug 2011, by IM Smith, IMS110050 & IMS110051 • 1 \bigcirc and 1 \oslash from Hastings County, Price Conservation Area, Skootamata River, junction of Highways 7 and 37, 20 May 1980, by IM Smith, IMS800009 • 1 \bigcirc from Muskoka District, Baysville, Echo Lake, bay near Lawsons Cottages, 9-12 Aug 1980, by IM Smith, IMS800015 • 1 \bigcirc from Muskoka District, Baysville, Echo Lake, 18 Aug 1981, by IM Smith, IMS810023 • **Quebec, Canada:** 1 \bigcirc and 1 \oslash from Gatineau County, Gatineau Park, Lac Philippe, at campground, 2 Jun 1981, by IM Smith & CJ Hill, IMS810001.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (7 \bigcirc ; 7 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola mjolniri are similar to other members of the Raptor Group (*T. gnoma, T. irapalpa, T. longitibia, T. elusiva, T. racupalpa, T. raptor, T. danielleae, T. daemon*, and *T. ivyae*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. mjolniri* can be differentiated from *T. elusiva, T. gnoma*, and *T. daemon* by having more elongate pedipalp tibiae (length/width = 5.00-6.00 in *T. mjolniri*, 3.88-4.67 in others) and a more elongate rostrum (length/width = 3.81-4.32 in *T. mjolniri*, 2.56-3.65 in others). *T. mjolniri* can be differentiated from *T. racupalpa* by having a longer anterior venter (Q = 180-195 in *T. mjolniri*, 152.5-165 in *T. racupalpa*; $\eth = 230-255$ in *T. mjolniri*, 200-205

in *T. racupalpa*) and by dorsal pattern. *T. mjolniri* can be differentiated from *T. irapalpa* and T. danielleae by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.2–2.48 in T. mjolniri, 1.42–2.09 in others); having a more elongate rostrum (3.81-4.32 in T. mjolniri, 2.66-3.75 in others); and by dorsal pattern. Male T. mjolniri can be differentiated from T. longitibia (only males) by having Dgl-4 closer to the edge of dorsum (dorsal width/distance between Dgl-4 = 2.2-2.32 in T. *mjolniri*, 2.46–2.71 in *T. longitibia*); stockier pedipalp tibiae (length/width = 5.0–5.33 in T. mjolniri, 5.5-5.5 in T. longitibia); and a more elongate subcapitulum (ventral length/height = 2.82-3.0 in T. mjolniri, 2.68-2.73 in T. longitibia). T. mjolniri can be differentiated from T. raptor by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.2-2.48 in T. mjolniri, 1.68-2.02 in T. raptor) and a stockier subcapitulum (ventral length/width Q = 2.68-2.9 in *T. mjolniri*, 2.98-3.18 in T. raptor; $\mathcal{E} = 2.82 - 3.0$ in T. mjolniri, 3.13-3.27 in T. raptor). Additionally, female *T. mjolniri* have a shorter anterior venter (180–195 in \bigcirc *T. mjolniri*, 205–240 in \bigcirc T. raptor). Female T. mjolniri can be differentiated from female T. ivyae by having a larger dorsum (length Q = 605–640 in *T. mjolniri*, 550–590 in *T. ivyae*; width Q = 510–545 in T. mjolniri, 460–500 in T. ivyae) and a longer anterior venter (\bigcirc 180–195 in T. mjolniri, 155–170 in T. ivyae). Male T. mjolniri can be differentiated from male *T. ivyae* by having a more elongate subcapitulum (ventral length/width = 2.82-3.00 in T. mjolniri, 2.57–2.75 in T. ivyae). Additionally, T. mjolniri can be differentiated from T. ivyae by being distributed in the northeast (T. ivyae is known from Florida).

Description. FEMALE (Figure 150) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (605–640 (605) long; 510–545 (520) wide) circular with navy blue to purple coloration posteriorly and a small spot anteriorly often connected medially with a thin strip that is occasionally orange. Anterio-medial platelets (130–150 (135) long; 67.5–70 (67.5) wide). Anterio-lateral platelets (182.5–200 (187.5) long; 67.5–70 (67.5) wide) free from dorsal plate. Dgl-4 closer to the muscle scars than to edge dorsum (distance between Dgl-4 207.5–245 (210)). Dorsal plate proportions: dorsum length/width 1.16–1.24 (1.16); dorsal width/distance between Dgl-4 2.22–2.48 (2.48); anterio-medial platelet length/width 1.86–2.14 (2.00); anterio-lateral platelet length/width 2.11–2.38 (2.27); anterio-lateral/anterio-medial length 1.22–1.46 (1.39).

Gnathosoma — **Subcapitulum** (342.5–355 (342.5) long (ventral); 255–277 (262.5) long (dorsal); 122.5–128.75 (126.25) tall) colorless. Rostrum (142.5–151.25 (151.25) long; 35–38.75 (35) wide). Chelicerae (355–383 (360) long) with curved fangs (52.5–55 (52.5) long) elongate. Subcapitular proportions: ventral length/height 2.68–2.90 (2.71); rostrum length/width 3.81–4.32 (4.32). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5–47.5 (47.5) long); femur (130–135 (130) long); genu (65–70 (65) long); tibia (110–112.5 (112.5) long; 18.75–22.5 (18.75) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.86–2.00 (2.00); tibia/femur 0.83–0.87 (0.87); tibia length/width 5.00–6.00 (6.00).

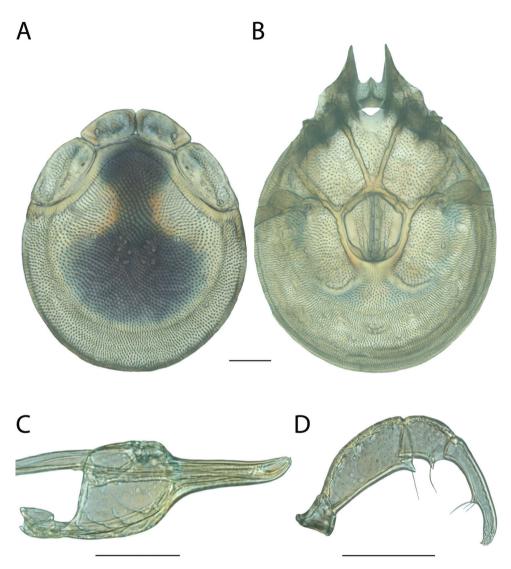

Figure 150. *Torrenticola mjolniri* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Venter — (780–825 (790) long; 536–621 (570) wide) often colorless, occasionally areas surrounding coxae are navy blue to purple. Gnathosomal bay (170–175 (175) long; 70–82.5 (70) wide). Cxgl-4 far from apex. **Medial suture** (15–20 (15) long). **Genital plates** (160–173.75 (170) long; 142.5–152.5 (142.5) wide). Additional measurements: Cx-1 (305–330 long (total); 132–164 (162.5) long (medial)); Cx-3 (332–383 wide); anterior venter (180–195 (187.5) long). Ventral proportions: gnathosomal bay length/width 2.06–2.50 (2.50); anterior venter/genital field length 1.07–1.22 (1.10); anterior venter length/genital field width 1.18–1.32 (1.32); anterior venter/medial suture 9.00–12.50 (12.50).

MALE (Figure 151) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (520–580 (520) long; 430–450 (430) wide) circular with navy blue to purple coloration posteriorly and a small spot anteriorly often connected medially with a thin strip that is occasionally orange. Anterio-medial platelets (120–135 (122.5) long; 60–67.5 (60) wide). Anterio-lateral platelets (175–200 (185) long; 67.5–77.5 (70) wide) free from dorsal plate. Dgl-4 closer to the muscle scars than to edge dorsum (distance between Dgl-4 185–205 (195)). Dorsal plate proportions: dorsum length/width 1.21–1.29 (1.21); dorsal width/distance between Dgl-4 2.20–2.32 (2.21); anterio-medial platelet length/width 1.85–2.04 (2.04); anterio-lateral platelet length/width 2.34–2.67 (2.64) anterio-lateral/anterio-medial length 1.40–1.51 (1.51).

Gnathosoma — **Subcapitulum** (305–325 (305) long (ventral); 233–241 (233) long (dorsal); 105–112.5 (107.5) tall) colorless. Rostrum (130–140 (130) long; 32.5–32.5 (32.5) wide). Chelicerae (297–322 (297) long) with curved fangs (48–55 (49) long) elongate. Subcapitular proportions: ventral length/height 2.82–3.00 (2.84); rostrum length/width 4.00–4.31 (4.00). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–42 (42.5) long); femur (115–122.5 (117.5) long); genu (60–65 (65) long); tibia (100–102.5 (102.5) long; 18.75–20 (20) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.81–1.96 (1.81); tibia/femur 0.82–0.87 (0.87); tibia length/ width 5.00–5.33 (5.13).

Venter — $(670-740 \ (670) \ \log; 459-504 \ (479) \ wide)$ often colorless, occasionally areas surrounding coxae are navy blue to purple. Gnathosomal bay (142.5–160 (145) long; 60–67.5 (67.5) wide). Cxgl-4 far from apex. **Medial suture** (62.5–85 (62.5) long). **Genital plates** (137.5–147.5 (137.5) long; 115–142.5 (115) wide). Additional measurements: Cx-1 (275–324 (287) long (total); 139–152 (139) long (medial)); Cx-3 (307–371 (324) wide); anterior venter (230–255 (230) long). Ventral proportions: gnathosomal bay length/width 2.15–2.46 (2.15); anterior venter/genital field length 1.60–1.76 (1.67); anterior venter length/genital field width 1.79–2.00 (2.00); anterior venter/medial suture 3.00–3.68 (3.68).

IMMATURES unknown.

Etymology. Specific epithet (*mjolniri*) named after Mjölnir—the hammer of Thor in Norse mythology—the ancient symbol of which resembles the dorsal patterning this species.

Distribution. Northeastern (Figure 149).

Remarks. Torrenticola mjolniri groups with other members of the Raptor Complex with high support and all specimens are less than 2% different in COI sequence from each other. In all analyses, *T. mjolniri* groups with *T. longitibia*, and these species are more than 4% different in COI sequence from each other. The position of that clade

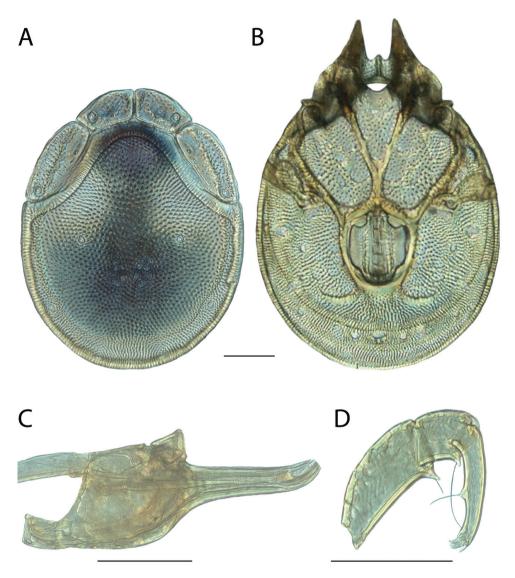

Figure 151. *Torrenticola mjolniri* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

varies with dataset. Based upon overall similarity, phylogenetic position, shape of the pedipalps, and distribution, we were able to place this species within the Raptor Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola mohawk Fisher & Dowling, sp. n. http://zoobank.org/387445A2-1757-4867-9771-DA7D6ADF62B6

Material examined. HOLOTYPE (\bigcirc): from USA, Maine, Aroostook County, Ashland; beside Rt. 11 at bridge over Aroostook River, (46°38'38"N, 68°24'24"W), 4 July 1989, by IM Smith, IMS890067.

PARATYPES (4 \bigcirc ; 5 \bigcirc): 1 \bigcirc (ALLOTYPE) from Aroostook County, Ashland; beside Rt. 11 at bridge over Aroostook River, (46°38'38"N, 68°24'24"W), 4 July 1989, by IM Smith, IMS890067 • 4 \bigcirc and 4 \bigcirc from Aroostook County, Ashland; beside Rt. 11 at bridge over Aroostook River, (46°38'38"N, 68°24'24"W), 4 July 1989, by IM Smith, IMS890067.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola mohawk are similar to other members of the Tricolor Complex (*T. bittikoferae*, *T. hoosieri*, *T. larvata*, *T. pearsoni*, *T. olliei*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, *T. unimaculata*, *T. cardia*, *T. kringi*, and *T. dimorpha*) in having a short, conical rostrum. *T. mohawk* are most similar to other members of the Tricolor Complex that have bold patterning (*T. larvata*, *T. tricolor*, *T. trimaculata*, *T. unimaculata*, *T. cardia*, and *T. kringi*). *T. mohawk* can be differentiated from *T. larvata*, *T. tricolor*, *T. cardia*, and *T. kringi* by having a stockier rostrum (length/width Q = 1.80-2.00 in *T. mohawk*, 2.14–3.13 in others; $\mathcal{J} = 2.00-2.13$ in *T. mohawk*, 2.27–2.93 in others). *T. mohawk* can be differentiated from *T. trimaculata* by dorsal pattern.

Description. FEMALE (Figure 153) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (680–725 (680) long; 540–560 (560) wide) ellipsoid with faint reddish-purple coloration medially. Anterio-medial platelets (130–140 (132.5) long; 60– 77.5 (60) wide). Anterio-lateral platelets (185–197.5 (190) long; 75–82.5 (75) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 365–385 (365)). Dorsal plate proportions: dorsum length/ width 1.21–1.32 (1.21); dorsal width/distance between Dgl-4 1.40–1.53 (1.53); anterio-medial platelet length/width 1.81–2.21 (2.21); anterio-lateral platelet length/ width 2.31–2.53 (2.53); anterio-lateral/anterio-medial length 1.40–1.43 (1.43).

Gnathosoma — **Subcapitulum** (240–267.5 (260) long (ventral); 170–190 (185) long (dorsal); 115–125 (120) tall) colorless. Rostrum (82.5–95 (90) long; 42.5–52.5 (45) wide) short and conical. Chelicerae (225–255 (240) long) with curved fangs (50–60 (60) long). Subcapitular proportions: ventral length/height 2.08–2.33 (2.17); rostrum length/width 1.80–2.00 (2.00). **Pedipalps** with short, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (41.25) long); femur (87.5–100 (95) long); genu (60–67.5 (65) long); tibia (77.5–87.5 (82.5) long; 25–27.5 (27.5) wide); tarsus (22.5–23.75 (23.75) long). Palpomere proportions: femur/genu 1.38–1.48 (1.46); tibia/femur 0.87–0.92 (0.87); tibia length/width 3.00–3.18 (3.00).

Venter — (800–850 (825) long; 600–630 (605) wide) colorless. Gnathosomal bay (125–145 (125) long; 70–75 (70) wide). Cxgl-4 subapical. **Medial suture** (30–45 (35)

Figure 152. Torrenticola mohawk sp. n. distribution.

long). Genital plates (190–205 (195) long; 157.5–170 (160) wide). Additional measurements: Cx-1 (260–285 (260) long (total); 130–140 (130) long (medial)); Cx-3 (355–370 (360) wide); anterior venter (187.5–200 (190) long). Ventral proportions: gnathosomal bay length/width 1.70–2.07 (1.79); anterior venter/genital field length 0.93–0.99 (0.97); anterior venter length/genital field width 1.12–1.21 (1.19); anterior venter/medial suture 4.44–6.33 (5.43).

MALE (Figure 154) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (615–660 (655) long; 460–485 (470) wide) ellipsoid with faint reddish-purple coloration medially. Anterio-medial platelets (120–130 (122.5) long; 65–76.25 (67.5) wide). Anterio-lateral platelets (180–192.5 (187.5) long; 75–80 (75) wide) free from dorsal plate Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 355–375 (360)). Dorsal plate proportions: dorsum length/width 1.33–1.39 (1.39); dorsal width/distance between Dgl-4 1.27–1.31 (1.31); anterio-medial platelet length/width 1.70–1.85 (1.81); anterio-lateral platelet length/width 2.25–2.50 (2.50); anterio-lateral/anterio-medial length 1.44–1.54 (1.53).

Gnathosoma — **Subcapitulum** (227.5–250 (250) long (ventral); 170–172.5 (172.5) long (dorsal); 105–107.5 (107.5) tall) colorless. Rostrum (80–90 (90) long; 40–45 (45) wide) short and conical. Chelicerae (210–225 (225) long) with curved fangs (50–55 (55) long). Subcapitular proportions: ventral length/height 2.17–2.33 (2.33); rostrum length/width 2.00–2.13 (2.00). **Pedipalps** with short, tuberculate ventral ex-

dial)); Cx-3 (350–360 (360) wide); anterior venter (290–307.5 (307.5) long). Ventral proportions: gnathosomal bay length/width 1.54–1.82 (1.71); anterior venter/genital field length 1.93–2.03 (2.02); anterior venter length/genital field width 2.74–2.93 (2.93); anterior venter/medial suture 2.27–2.42 (2.37).

IMMATURES unknown.

Etymology. Specific epithet (*mohawk*) named in honor of the Mohawk people (Kanien'kehá:ka), in reference to the dorsal coloration of this species, which resembles the hair-style by the same name (as a noun in apposition). The modern hairstyle does

not exactly match traditional Mohawk styles, which resembled that of other tribes of the Iroquois Confederacy. Nevertheless, mohawks the hairstyle, which were originally associated with the Mohawk people in the historically problematic film *Drums Along the Mohawk* (1939), remains a symbol of the Mohawk people.

Distribution. Maine (Figure 152).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola mohawk* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution in the east, and short conical rostrum that is downturned in males, are consistent with placing this species in the Tricolor Complex and within the eastern clade of the Tricolor Identification Group.

Torrenticola mulleni Fisher & Dowling, sp. n. http://zoobank.org/56A3D559-6999-4116-9C5C-6DCC7473A979

Material examined. HOLOTYPE (Q): from USA, Wyoming, Fremont County, Wind River Mountains, Sinks Canyon, Popo Agie River, south of Lander, 1 Aug 2012, by IM Smith, IMS120049, DNA 2928.

PARATYPES (6 \bigcirc ; 5 \checkmark): Idaho, USA: 1 \bigcirc from Blaine County, Little Wood River (43°29'51"N, 114°3'28"W), 27 Jul 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0727-001 • 1 & from Custer County, Morgan Creek (44°39'20"N, 114°12'56"W), 31 Jul 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0731-004 • Montana, USA: 1 \bigcirc and 1 \bigcirc from Ravalli County, Bitterroot National Forest, East Fork Bitterroot River (45°51'40"N, 114°1'46"W), 3 Aug 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0803-005 • 1 ♀ and 1 ♂ from Missoula County, Lolo National Forest, off 12, Lolo Creek (46°46'7"N, 114°27'53"W), 7 Aug 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0807-003 • Utah, **USA:** 1 9 from Summit County, Wasatch-Cache National Forest, Slate Creek (40°37'45"N, 111°11'46"W), 23 Jul 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0723-006 • 1 & from Wasatch County, Wasatch-Cache National Forest, Provo River (40°35'37"N, 111°5'43"W), 23 Jul 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0723-001 • Wyoming, USA: 1 👌 (ALLOTYPE) from Fremont County, Wind River Mountains, Sinks Canyon, Popo Agie River, south of Lander, 1 Aug 2012, by IM Smith, IMS120049, DNA 2929 • 1 \bigcirc from Fremont County, Wind River Mountains, Sinks Canyon, Popo Agie River, south of Lander, 1 Aug 2012, by IM Smith, IMS120049 • 1 ♀ from Johnson County, Bighorn Mountains, Clear Creek, west of Buffalo Mosier Gulch Picnic Area, 28 Jul 2012, by IM Smith, IMS120041.

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and some paratypes $(4 \bigcirc; 3 \bigcirc)$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \bigcirc)$ deposited in ACUA.

Diagnosis. Torrenticola mulleni are similar to other members of the Rusetria "Western 2-Plates" group (T. nortoni, T. walteri, and T. welbourni) in having anterio-

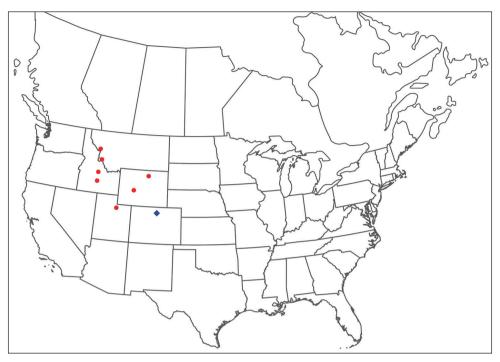

Figure 155. *Torrenticola mulleni* sp. n. distribution. Red dots represent material examined. Blue dot represents previously-published record (Young 1969), reported as *T. indistincta*, but likely representing *T. mulleni*.

lateral platelets fused to the dorsal plate, having faint dorsal coloration, and being distributed in the west. Female *T. mulleni* can be differentiated from other female Western 2-Plates by having a longer medial suture (20–22.5 in *T. mulleni*, 10–12.5 in others). Male *T. mulleni* can be differentiated from other male Western 2-Plates by having a longer genital field (130–140 in *T. mulleni*, 112–125 in others). Additionally, *T. mulleni* can be differentiated from other Western 2-Plates by being distributed in the Rocky Mountains (Idaho, Montana, Utah and Wyoming) instead of California, Oregon and British Columbia.

Description. FEMALE (Figure 156) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (595–645 (640) long; 415–470 (440) wide) ovoid with faint purple coloration separated into anterior and posterior portions. Anterio-medial platelets (127.5–145 (145) long; 40–47.5 (45) wide). Anterio-lateral platelets (151.25–165 (160) long; 50–57.5 (57.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 300–330 (320)). Dorsal plate proportions: dorsum length/width 1.37–1.45 (1.45); dorsal width/distance between Dgl-4 1.34–1.47 (1.38); anterio-medial platelet length/width 2.95–3.24 (3.22); anterio-lateral platelet length/width 2.75–3.15 (2.78); anterio-lateral/anterio-medial length 1.10–1.29 (1.10).

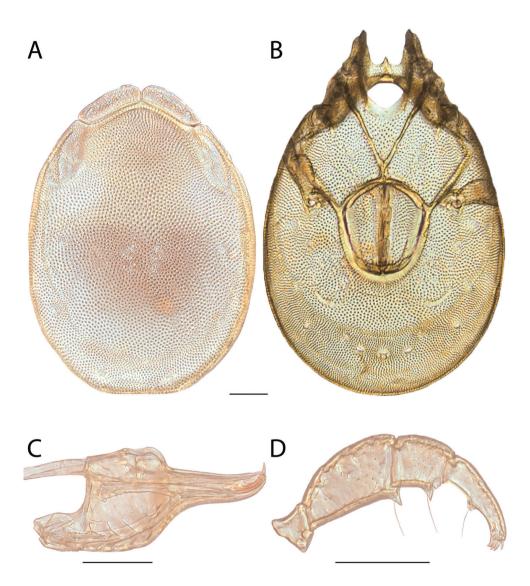

Figure 156. *Torrenticola mulleni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

Gnathosoma — **Subcapitulum** (300–327.5 (322.5) long (ventral); 225–245 (245) long (dorsal); 125–150 (145) tall) colorless. Rostrum (120–135 (125) long; 40–45 (45) wide). Chelicerae (300–335 (320) long) with curved fangs (40–65 (65) long). Subcapitular proportions: ventral length/height 2.14–2.40 (2.22); rostrum length/width 2.78–3.18 (2.78). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–52.5 (42.5) long); femur (112.5–125 (117.5) long); genu (65–72.5 (67.5) long); tibia (82.5–90 (82.5) long; 26.25–28.75 (26.25) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions:

femur/genu 1.70–1.75 (1.74); tibia/femur 0.70–0.78 (0.70); tibia length/width 3.0–3.33 (3.14).

Venter — (720–790 (770) long; 460–500 (490) wide) colorless. Gnathosomal bay (160–175 (175) long; 75–90 (85) wide). Cxgl-4 subapical. **Medial suture** (20–22.5 (20) long). **Genital plates** (195–205 (205) long; 170–180 (175) wide). Additional measurements: Cx-1 (285–300 (300) long (total); 115–135 (130) long (medial)); Cx-3 (302.5–335 (320) wide); anterior venter (145–162.5 (155) long). Ventral proportions: gnathosomal bay length/width 1.89–2.16 (2.06); anterior venter/genital field length 0.74–0.80 (0.76); anterior venter length/genital field width 0.85–0.91 (0.89); anterior venter/medial suture 6.89–8.0 (7.75).

MALE (Figure 157) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (505–535 (530) long; 350–370 (360) wide) ovoid with faint purple coloration separated into anterior and posterior portions. Anterio-medial platelets (107.5–115 (110) long; 40–41.25 (40) wide). Anterio-lateral platelets (142.5–147.5 (142.5) long; 50–52.5 (52.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 270–280 (280)). Dorsal plate proportions: dorsum length/width 1.44–1.47 (1.47); dorsal width/distance between Dgl-4 1.29–1.37 (1.29); anterio-medial platelet length/width 2.61–2.88 (2.75); anterio-lateral platelet length/width 2.71–2.95 (2.71); anterio-lateral/anterio-medial length 1.28–1.33 (1.30).

Gnathosoma — **Subcapitulum** (262.5–277.5 (265) long (ventral); 195–210 (202.5) long (dorsal); 105–110 (105) tall) colorless. Rostrum (100–110 (110) long; 37.5–40 (40) wide). Chelicerae (265–270 (270) long) with curved fangs (50–55 (55) long). Subcapitular proportions: ventral length/height 2.39–2.58 (2.52); rostrum length/width 2.63–2.75 (2.75). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–40 (40) long); femur (97.5–102.5 (102.5) long); genu (60–65 (62.5) long); tibia (75–82.5 (82.5) long; 26.25–27.5 (27.5) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.58–1.64 (1.64); tibia/femur 0.75–0.80 (0.80); tibia length/width 2.73–3.00 (3.00).

Venter — (620–650 (650) long; 390–425 (410) wide) colorless. Gnathosomal bay (130–135 (132.5) long; 70–75 (75) wide). Cxgl-4 subapical. **Medial suture** (100–105 (102.5) long). **Genital plates** (130–140 (140) long; 100–110 (110) wide). Additional measurements: Cx-1 (265–285 (285) long (total); 140–145 (140) long (medial)); Cx-3 (290–310 (310) wide); anterior venter (250–260 (250) long). Ventral proportions: gnathosomal bay length/width 1.77–1.93 (1.77); anterior venter/genital field length 1.79–2.00 (1.79); anterior venter length/genital field width 2.27–2.60 (2.27); anterior venter/medial suture 2.38–2.60 (2.44).

IMMATURES unknown.

Etymology. Specific epithet (*mulleni*) named in honor of Gary Mullen of Auburn University, who boldly devoted the entire second half of his Arachnology course to mites, and thus, in 2001, first introduced JRF to these creatures, sparking a life-long fascination.

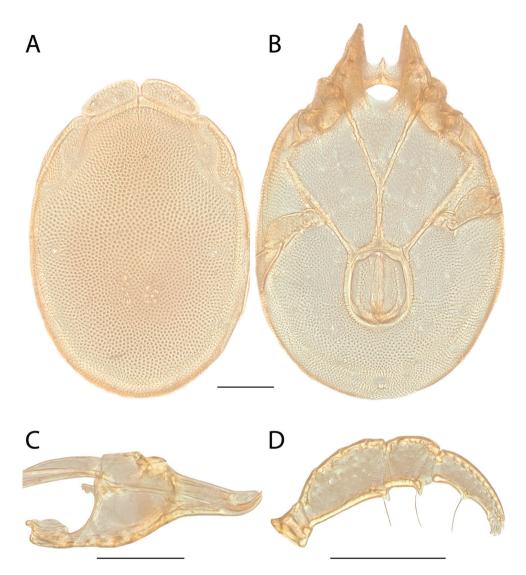

Figure 157. *Torrenticola mulleni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

Distribution. Rocky Mountain region (Figure 155).

Remarks. Torrenticola mulleni groups with other members of the Rusetria Complex with high support and specimens are less than 2% different in COI sequence from each other. In the all analyses, *T. mulleni* groups with the three other members of the Rusetria Complex that are found in western North America: *T. nortoni, T. walteri*, and *T. welbourni*. These species are 5–7% different in COI sequence from each other. *T. mulleni* is the only member of the Rusetria Complex that occurs throughout Rocky Mountains. Only *T. walteri* may overlap with this species in the northern Rockies of

British Columbia; however, this overlap is speculative as *T. mulleni* was not found in any of our British Columbia samples. Young (1969) reported *T. indistincta* from Colorado, but we suspect this record represents *T. mulleni*.

Based upon overall similarity, the fusion of the posterio-lateral platelets to the dorsal shield, phylogenetic position, and distribution, we place this species within the Western 2-Plate Identification Group.

This species hypothesis is supported by non-overlapping distribution, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Diagnosis. Torrenticola multiforma are similar to other members of the Ellipsoidalis Group (*T. ellipsoidalis, T. occidentalis,* and *T. leviathan*), in being among the largest *Torrenticola* in the west (dorsum length $\mathcal{Q} = 700-885$; $\mathcal{O} = 665-850$), although *T. sierrensis* are also large (dorsum length $\mathcal{Q} = 700-880$; $\mathcal{O} = 590-735$) but can easily be distinguished from the Ellipsoidalis Group by being circular instead of ellipsoid or rectangular (dorsum length/width = 1.17-1.28 in *T. sierrensis*, 1.30-1.67 in Ellipsoidalis Group). *T. multiforma* are best differentiated from other members of the Ellipsoidalis Group by having more elongate subcapitular rostra (length/width = 2.5-2.8 in *T. multiforma*, 1.84-2.27 in other Ellipsoidalis Group).

Re-description. FEMALE (Figure 159) (n = 6) with characters of the genus with following specifications.

Dorsum — (700–850 (730) long; 500–615 (550) wide) ellipsoid with highly variable coloration, colorless to orange to purple without distinct pattern. Anteriomedial platelets (132.5–150 (145) long; 65–77.5 (65) wide). Anterio-lateral platelets (195–230 (195) long; 77.5–92.5 (82.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 380–465 (400)). Dorsal plate proportions: dorsum length/width 1.31–1.41 (1.33); dorsal width/distance between Dgl-4 1.26–1.38 (1.38); anterio-medial platelet length/ width 1.94–2.27 (2.23); anterio-lateral platelet length/width 2.34–2.87 (2.36); anter-io-lateral/anterio-medial length 1.34–1.57 (1.34).

Gnathosoma — **Subcapitulum** (340–385 long (ventral); 255–284 long (dorsal); 145–172.5 tall) colorless. Rostrum (132.5–152.5 long; 50–55 wide). Chelicerae (336–395 long) with curved fangs (62–79 long). Subcapitular proportions: ventral length/height 2.19–2.46; rostrum length/width 2.5–2.8. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–45 long); femur (115–127.5 long); genu (75–90 long); tibia (87.5–95 long; 27.5–32.5 wide); tarsus (17.5–20 long). Palpomere proportions: femur/genu 1.42–1.53; tibia/femur 0.71–0.78; tibia length/width 2.77–3.18.

Venter — (840–1010 long; 588–679 wide) colorless. Gnathosomal bay (165–217.5 long; 82.5–100 wide). Cxgl-4 subapical. **Medial suture** (17.5–32.5 long). **Genital plates** (210–242.5 long; 197.5–222.5 wide). Additional measurements: Cx-1 (295–380 long (total); 123–170 long (medial)); Cx-3 (359–441 wide); anterior venter (175–212.5 long). Ventral proportions: gnathosomal bay length/width 1.89–2.44; anterior venter/genital field length 0.79–0.92; anterior venter length/genital field width 0.86–1.05; anterior venter/medial suture 5.83–11.14.

MALE (Figure 160) (n = 6) with characters of the genus with following specifications.

Dorsum — (665–790 long; 470–580 wide) ellipsoid with highly variable coloration, colorless to orange to purple without distinct pattern. Anterio-medial platelets (125–165 long; 60–77.5 wide). Anterio-lateral platelets (185–222.5 long; 75–87.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the

late ventral extensions on femora and genua. Palpomeres: trochanter (40–45 long); femur (102.5–122.5 long); genu (70–87.5 long); tibia (80–95 long; 26.25–32.5 wide); tarsus (17.5–20 long). Palpomere proportions: femur/genu 1.40–1.50; tibia/femur 0.73–0.79; tibia length/width 2.91–3.33.

Venter — (805–940 long; 479–653 wide) colorless. Gnathosomal bay (172.5–197.5 long; 75–100 wide). Cxgl-4 subapical. **Medial suture** (62.5–82.5 long). **Genital plates** (175–190 long; 140–155 wide). Additional measurements: Cx-1 (308–375 long (total); 127–180 long (medial)); Cx-3 (351–421 wide); anterior venter (225–270

long). Ventral proportions: gnathosomal bay length/width 1.92–2.30; anterior venter/ genital field length 1.29–1.46; anterior venter length/genital field width 1.57–1.81; anterior venter/medial suture 3.27–4.00.

IMMATURES unknown.

Etymology. Habeeb (1974) did not specify an etymology for the specific epithet (*multiforma*). However, he notes that the males "vary a lot in size." Thus, we suspect the specific epithet refers to the variable body size males of this species (*multus*, L. many; *forma*, L. form).

Distribution. Western (Figure 158). *T. multiforma* was previously known only from Prairie Creek, California (Habeeb 1974), but we expand its range to include most of western North America.

Remarks. *Torrenticola multiforma* groups other members of the Miniforma Complex with high support and specimens are 0–3% different in COI sequence. This is higher sequence variability than in many species hypotheses presented herein. However, given the topology in the COI tree (Figure 10) and morphological similarity, it seems apparent that the variability represents a continuum across a large distribution, rather than isolated species.

In all analyses, *T. multiforma* groups with *T. ellipsoidalis* and *T. regalis*, which are greater than 10% different from each other. Based upon overall similarity, body size, and distribution, we place this species within the Ellipsoidalis Identification Group.

This species hypothesis is supported by phylogenetic affinity, biogeography, high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Type deposition. Holotype (\mathcal{Q}) and allotype (\mathcal{Z}) deposited in the CNC.

Diagnosis. Torrenticola neoanomala are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba, and T. shubini), Elongata Group (T. elongata, T. gorti, and T. reduncarostra) and T. interiorensis, T. bondi, T. erectirostra, T. robisoni, T. irapalpa, T. racupalpa, T. skvarlai, and T. arktonyx. They can be differentiated from Rusetria 4-Plates and T. skvarlai by having distinct hind coxal margins. T. neoanomala can be differentiated from T. erectirostra and T. robisoni by having a straight, anteriorlydirected rostrum (upturned in T. erectirostra and T. robisoni). T. neoanomala can be differentiated from T. arktonyx by having an unmodified dorsal plate (T. arktonyx has distinctive longitudinal dark markings on the anterior portion of the dorsal plate that fade posteriorly). T. neoanomala can be differentiated from T. racupalpa and T. *irapalpa* by having more elongate anterio-lateral platelets (length/width = 2.79-3.23in T. neoanomala, 2.17-2.67 in others) and Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 = 1.37-1.5 in T. neoanomala, 1.58-2.77 in others). T. neoanomala can be differentiated from Elongata Group by being slightly more ovoid (dorsum length/width Q = 1.35-1.43 in *T. neoanomala*, 1.45-2.08 in Elongata Group; $\mathcal{J} = 1.43 - 1.50$ in *T. neoanomala*, 1.51 - 1.7 in Elongata Group) and having a stockier rostrum (length/width = 2.59-2.90 in T. neoanomala, 3.24-4.00 in Elongata Group). T. neoanomala can be differentiated from T. bondi by having a longer medial suture ($\bigcirc = 22-40$ in *T. neoanomala*, 10–15 in *T. bondi*; $\bigcirc = 95-108$ in *T. neoanomala*, 55–70 in *T. bondi*) and by anterior venter/genital field width (Q = 1.39-1.45 in *T. neoanomala*, 1.15-1.25 in *T. bondi*; c = 2.42-2.66 in *T. neoanomala*, 1.95–2.05 in T. bondi). Female T. neoanomala can be differentiated from female T. interiorensis by having more elongate anterio-lateral platelets (length/width = 2.86–3.09 in T. neoanomala, 2.62–2.67 in T. interiorensis). Male T. neoanomala can be differentiated from male T. interiorensis by having a longer anterior venter (267.5-290 in T. neoanomala, 220-240 in T. interiorensis) and a longer genital field (145-160 in T. neoanomala, 132-138 in T. interiorensis).

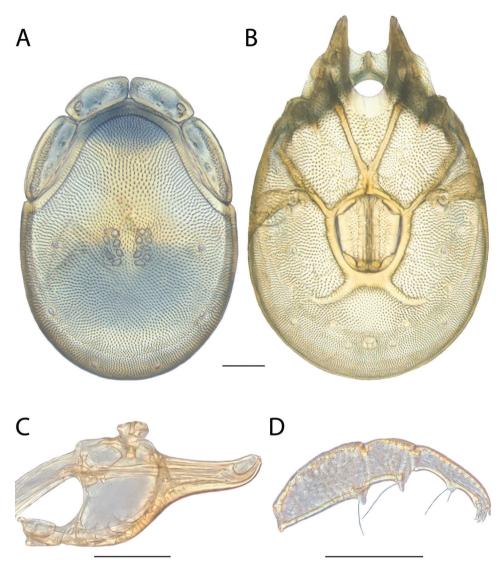

Figure 162. *Torrenticola neoanomala* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Re-description. FEMALE (Figure 162) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–680 (650) long; 420–480 (480) wide) ovoid with bluish-purple to purple coloration separated into anterior and posterior portions with faint orange medially. Anterio-medial platelets (135–155 (140) long; 52.5–65 (60) wide). Anterio-lateral platelets (177.5–205 (205) long; 57.5–70 (67.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 280–345 (345)). Dorsal plate proportions: dorsum length/width 1.35–1.43

(1.35); dorsal width/distance between Dgl-4 1.39–1.50 (1.39); anterio-medial platelet length/width 2.23–2.58 (2.33); anterio-lateral platelet length/width 2.86–3.09 (3.04); anterio-lateral/anterio-medial length 1.29–1.46 (1.46).

Gnathosoma — **Subcapitulum** (320–350 long (ventral); 235–259 long (dorsal); 130–152.5 tall) colorless. Rostrum (120–142.5 long; 45–55 wide). Chelicerae (315–358 long) with curved fangs (56–61 long). Subcapitular proportions: ventral length/height 2.30–2.46; rostrum length/width 2.59–2.89. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–47.5 (47.5) long); femur (110–128.75 (123.75) long); genu (67.5–75 (70) long); tibia (77.5–90 (90) long; 21.25–25 (25) wide); tarsus (16.25–20 (20) long). Palpomere proportions: femur/genu 1.63–1.81 (1.77); tibia/femur 0.67–0.74 (0.73); tibia length/width 3.58– 3.68 (3.60).

Venter — (680–820 (770) long; 480–570 (570) wide) mostly colorless with faint bluish-purple or purple in areas surrounding coxae. Gnathosomal bay (147.5–177.5 (160) long; 87.5–107.5 (107.5) wide). Cxgl-4 subapical. **Medial suture** (22.5–40 (40) long). **Genital plates** (157.5–187.5 (187.5) long; 140–155 (145) wide). Additional measurements: Cx-1 (300–334 (325) long (total); 144–169 (162.5) long (medial)); Cx-3 (336–412.5 (412.5) wide); anterior venter (195–225 (207.5) long). Ventral proportions: gnathosomal bay length/width 1.49–1.78 (1.49); anterior venter/genital field length 1.11–1.27 (1.11); anterior venter length/genital field width 1.39–1.45 (1.43); anterior venter/medial suture 5.19–9.44 (5.19).

MALE (Figure 163) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (545–635 (555) long; 370–430 (370) wide) ovoid with bluish-purple to purple coloration separated into anterior and posterior portions with faint orange medially. Anterio-medial platelets (120–130 (120) long; 48.75–62.5 (48.75) wide). Anterio-lateral platelets (167.5–197.5 (167.5) long; 55–62.5 (60) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 255–315 (265)). Dorsal plate proportions: dorsum length/width 1.43–1.50 (1.50); dorsal width/distance between Dgl-4 1.37–1.49 (1.40); anterio-medial platelet length/width 2.08–2.46 (2.46); anterio-lateral platelet length/width 2.79–3.23 (2.79); anterio-lateral/anterio-medial length 1.40–1.52 (1.40).

Gnathosoma — **Subcapitulum** (272.5–315 (272.5) long (ventral); 207.5–235 (207.5) long (dorsal); 97.5–122.5 (97.5) tall) colorless. Rostrum (112.5–127.5 (112.5) long; 38.75–45 (38.75) wide). Chelicerae (262–307 (267.5) long) with curved fangs (48–58 (55) long). Subcapitular proportions: ventral length/height 2.57–2.79 (2.79); rostrum length/width 2.67–2.90 (2.90). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–42.5 (40) long); femur (100–115 (100) long); genu (60–70 (60) long); tibia (78.75–87.5 (78.75) long; 20–26.25 (20) wide); tarsus (15–20 (15) long). Palpomere proportions: femur/genu 1.60–1.69 (1.67); tibia/femur 0.74–0.80 (0.79); tibia length/width 3.33–3.94 (3.94).

Venter — (675–770 (675) long; 420–515 (470) wide) mostly colorless with faint bluish-purple or purple in areas surrounding coxae. Gnathosomal bay (127.5–152.5

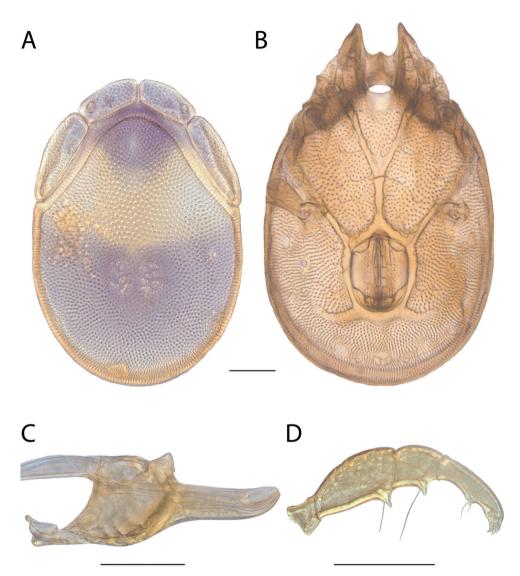

Figure 163. *Torrenticola neoanomala* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(127.5) long; 68.75–90 (73.75) wide). Cxgl-4 subapical. **Medial suture** (95–107.5 (102.5) long). **Genital plates** (145–160 (150) long; 102.5–120 (102.5) wide). Additional measurements: Cx-1 (270–323 (270) long (total); 142–169 (152.5) long (medial)); Cx-3 (322–384 (340) wide); anterior venter (267.5–290 (272.5) long). Ventral proportions: gnathosomal bay length/width 1.69–2.15 (1.73); anterior venter/genital field length 1.79–1.90 (1.82); anterior venter length/genital field width 2.42–2.66 (2.66); anterior venter/medial suture 2.60–2.83 (2.66).

IMMATURES unknown.

Etymology. Habeeb (1957) did not specify an etymology for the specific epithet (*neoanomala*). In fact, Habeeb (1955) initially identified the specimens as the Palaearctic *T. anomala*, but later (1957) writes, "The mite I reported as *Torrenticola anomala* (Koch) is now seen to be distinct from this European form." So, this name surely refers to the similarity of this species to the *T. anomala* (Koch, 1837) (*néos*, G. new).

Distribution. *T. neoanomala* was previously known only from Albert County, New Brunswick, but we extend its range throughout eastern North America (Figure 161). Records from Shackelford County, Texas, make *T. neoanomala* one of the few eastern *Torrenticola* that are found in the Great Plains.

Remarks. *Torrenticola neoanomala* groups with other members of the Raptor Complex with high support and specimens are less than 2.5% different in COI sequence from each other. In the combined analysis, *T. neoanomala* groups with the superficially similar *T. interiorensis*, and specimens from these species are greater than 9% different in COI sequence from each other.

Based upon this relationship and their similarity, we place these species in the Neoanomala Identification Group. The Neoanomala Group shares a phylogenetic affinity for members of the similar-looking Erectirostra Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Diagnosis. Torrenticola nigroalba are similar to other members of the Nigroalba Group (*T. flangipalpa, T. solisorta, T. dentirostra*) in being small, slightly elongate, having purple dorsal coloration restricted posteriorly, and having distinct yet poorly-defined hind coxal margins. *T. nigroalba* can be differentiated from *T. flangipalpa* in having tuber-

culate pedipalp femoral extension (flange-like and anteriorly-directed in *T. flangipalpa*); a shorter anterior venter (200-223 in T. nigroalba, 235-265 in T. flangipalpa); and more elongate pedipalpal tibiae (length/ width $\mathcal{Q} = 5.38-5.83$ in *T. nigroalba*, 4.79-5.00 in T. flangipalpa; $\mathcal{E} = 5.08 - 5.33$ in T. nigroalba, 4.40-4.86 in T. flangipalpa). T. nigroalba can be differentiated from T. dentirostra by having a smooth rostrum (T. dentirostra has a dentate bump midway on the dorsal edge of the rostrum) and by having more elongate pedipalpal tibiae (length/width \mathcal{Q} = 5.3–5.9 in *T. nigroalba*, 4.5–5.0 in *T. dentirostra*; \mathcal{J} = 5.0-5.4 in T. nigroalba, 4.5-4.7 in T. dentirostra). T. nigroalba can be differentiated from *T. solisorta* by lacking orangish coloration immediately anterior to the purple dorsal coloration, although rarely specimens have been found with this coloration. Female T. nigroalba are also slightly larger (500–530 in T. nigroalba, 475–500 in T. solisorta); have a thinner gnathosomal bay (length/width = 1.25-1.55 in T. nigroalba, 1.3-1.5 in T. solisorta); and have a slightly thicker subcapitulum (3.00–3.14 in T. nigroalba, 3.14–3.30 in T. solisorta). Male T. nigroalba also have a longer medial suture with respect to the anterior venter (anterior venter/medial suture = 2.54–2.77 in T. nigroalba, 2.87–3.26 in T. solisorta) and a thinner dorsum (290-300 in T. nigroalba, 305-320 in T. solisorta). Other Torrenticola with purple dorsal coloration restricted posteriorly can be confused with T. nigroalba, such as T. tahoei and T. oregonensis. Both of these species are larger (dorsum length \mathcal{Q} = 500–530 in *T. nigroalba*, 600–810 in others; \mathcal{J} = 440–455 in *T. nigroalba*, 560-820 in others) and distributed in the west (T. nigroalba is eastern).

Type deposition. Holotype (\bigcirc) and allotype (\bigcirc) deposited in the CNC.

Re-description. FEMALE (Figure 165) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (500–530 (510) long; 330–365 (350) wide) ovoid with bluish-purple to purple coloration restricted posteriorly (rarely with faint orange at the anterior edge of the purple, especially medially). Anterio-medial platelets (105–112.5 (105) long; 40–47.5 (40) wide). Anterio-lateral platelets (145–160 (157.5) long; 46.25–52.5 (50) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 230–260 (245)). Dorsal plate proportions: dorsum length/width 1.42–1.53 (1.46); dorsal width/distance between Dgl-4 1.33–1.46 (1.43); anterio-medial platelet length/width 2.32–2.65 (2.63); anterio-lateral platelet length/width 2.90–3.26 (3.15); anterio-lateral/anterio-medial length 1.29–1.51 (1.50).

Gnathosoma — **Subcapitulum** (280–298 long (ventral); 197.5–220 long (dorsal); 92.5–97.5 tall) elongate and colorless. Rostrum (102.5–112.5 long; 35–40 wide). Chelicerae (273–287 long) with curved fangs (40–53 long). Subcapitular proportions: ventral length/height 3.03–3.14; rostrum length/width 2.81–3.10. **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua ending broadly and dentate. Palpomeres: trochanter (30–35 (32.5) long); femur (90–95 (95) long); genu (55–57.5 (57.5) long); tibia (85–92.5 (87.5) long; 15–16.25 (13.75) wide); tarsus (12.5–15 (12.5) long). Palpomere proportions: femur/genu 1.64–1.73 (1.65); tibia/femur 0.92–0.97 (0.92); tibia length/width 5.38–5.83 (5.38).

Venter — (620–660 (640) long; 340–430 (430) wide) with faint bluish purple or purple coloration. Gnathosomal bay (110–120 (110) long; 72.5–82.5 (82.5) wide).

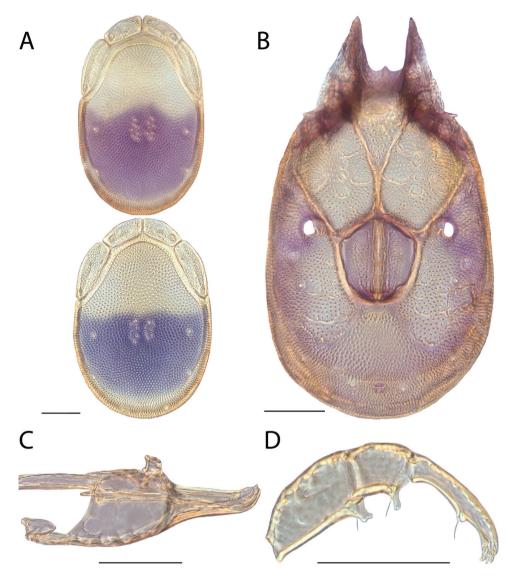

Figure 165. *Torrenticola nigroalba* female: **A** dorsal plates, note variation **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Cxgl-4 far from apex. **Medial suture** (50–55 (55) long). **Genital plates** (135–142.5 (137.5) long; 122.5–132.5 (123.75) wide). Additional measurements: Cx-1 (243–250 (250) long (total); 98–140 (140) long (medial)); Cx-3 (239–285 (285) wide); anterior venter (200–212.5 (203.75) long). Ventral proportions: gnathosomal bay length/ width 1.33–1.55 (1.33); anterior venter/genital field length 1.42–1.53 (1.48); anterior venter length/genital field width 1.51–1.68 (1.65); anterior venter/medial suture 3.70–4.25 (3.70).

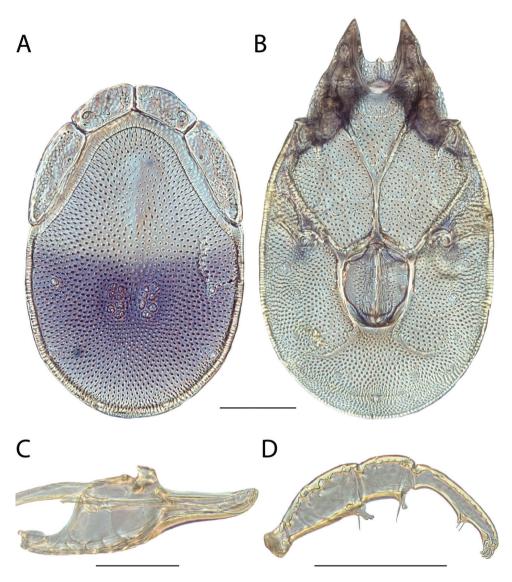

Figure 166. *Torrenticola nigroalba* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

MALE (Figure 166) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (440–455 (455) long; 290–300 (295) wide) ovoid with bluish-purple to purple coloration restricted posteriorly. Anterio-medial platelets (92.5–100 (97.5) long; 35–42.5 (35) wide). Anterio-lateral platelets (137.5–150 (142.5) long; 40–47.5 (47.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the mus-

cle scars (distance between Dgl-4 205–225 (225)). Dorsal plate proportions: dorsum length/width 1.50–1.55 (1.54); dorsal width/distance between Dgl-4 1.31–1.41 (1.31); anterio-medial platelet length/width 2.26–2.86 (2.79); anterio-lateral platelet length/ width 3.00–3.63 (3.00); anterio-lateral/anterio-medial length 1.38–1.58 (1.46).

Gnathosoma — **Subcapitulum** (247.5–260 (250) long (ventral); 181–188.75 (188.75) long (dorsal); 77.5–82.5 (82.5) tall) elongate and colorless. Rostrum (92.5–97.5 (97.5) long; 32.5–35 (32.5) wide). Chelicerae (225–237.5 (237.5) long) with curved fangs (35–40 (40) long). Subcapitular proportions: ventral length/height 3.03–3.23 (3.03); rostrum length/width 2.79–3.00 (3.00). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua ending broadly and dentate. Palpomeres: trochanter (25–30 (25) long); femur (77.5–82.5 (78.75) long); genu (50–55 (50) long); tibia (76.25–83.75 (80) long; 15–16.25 (15) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.50–1.65 (1.58); tibia/ femur 0.95–1.05 (1.02); tibia length/width 5.08–5.33 (5.33).

Venter — (550–570 (550) long; 313–380 (370) wide) with faint bluish purple or purple coloration. Gnathosomal bay (100–107.5 (102.5) long; 60–70 (67.5) wide). Cxgl-4 far from apex. **Medial suture** (77.5–87.5 (80) long). **Genital plates** (105–118.75 (118.75) long; 85–92.5 (90) wide). Additional measurements: Cx-1 (216–237 (235) long (total); 97–135 (127.5) long (medial)); Cx-3 (230–263 (255) wide); anterior venter (212.5–222.5 (215) long). Ventral proportions: gnathosomal bay length/ width 1.43–1.75 (1.52); anterior venter/genital field length 1.81–2.12 (1.81); anterior venter length/genital field width 2.32–2.51 (2.39); anterior venter/medial suture 2.54–2.77 (2.69).

IMMATURES unknown.

Etymology. Habeeb (1955) did not specify an etymology for the specific epithet (*nigroalba*). However, surely this name refers to the dorsal coloration being half pigmented (purple) and half unpigmented (yellow), although Habeeb (1955) identified these colors as black and white (*niger*, L. black; *albus*, L. white).

Distribution. Northeastern and southward throughout the Appalachians (Figure 164). *T. nigroalba* was previously known only from Albert County, New Brunswick; we extend its distribution throughout the Appalachians and into Ottawa.

Remarks. Torrenticola nigroalba groups with other members of the Raptor Complex with high support in all analyses and specimens are less than 1% different in COI sequence from each other. In all analyses, *T. nigroalba* groups with two other morphologically similar species: *T. flangipalpa* and *T. solisorta*. These three species are greater than 12% different from each other in COI sequence. That clade of three species corresponds to an identification group, the Nigroalba Group, the members of which are easily differentiated by their size, coloration, long medial suture in females, and overall appearance.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola nortoni Fisher & Dowling, sp. n. http://zoobank.org/6F164498-113D-4319-8ADB-D85FE40CBC46

Material examined. HOLOTYPE (♀): from USA, California, Trinity County, Shasta-Trinity National Forest, Wilson Creek (40°25'17"N, 123°3'5"W), 20 Aug 2013, by JR Fisher, JRF 13-0820-003, DNA 3000.

PARATYPES (9 \bigcirc ; 5 \circlearrowright): **California, USA**: 1 \circlearrowright (ALLOTYPE) from USA, California, Trinity County, Shasta-Trinity National Forest, Wilson Creek (40°25'17"N, 123°3'5"W), 20 Aug 2013, by JR Fisher, JRF 13-0820-003, DNA 2996 • 5 \bigcirc and 2 \circlearrowright from Plumas County, Plumas National Forest, Silver Creek (39°56'60"N, 121°2'17"W), 24 Aug 2013, by JR Fisher, JRF 13-0824-005 • 3 \bigcirc and 1 \circlearrowright from Trinity County, Shasta-Trinity National Forest, Wilson Creek (40°25'17"N, 123°3'5"W), 20 Aug 2013, by JR Fisher, JRF 13-0820-003 • 1 \bigcirc and 1 \circlearrowright from Tulare County, Sequoia National Forest, Brush Creek (35°57'57"N, 118°28'43"W), 3 Sep 2013, by JR Fisher, JRF 13-0903-002.

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and some paratypes $(5 \bigcirc; 2 \bigcirc)$ deposited in the CNC; other paratypes $(4 \heartsuit; 2 \bigcirc)$ deposited in ACUA.

Diagnosis. Torrenticola nortoni are similar to other members of the Rusetria "Western 2-Plates" group (T. mulleni, T. walteri, and T. welbourni) in having anteriolateral platelets fused to the dorsal plate, having faint dorsal coloration (some are colorless), and being distributed in the west. Female T. nortoni can be differentiated from *T. welbourni* (female only known) by having stockier pedipalp tibiae (3.13–3.33 in A33, 3.73 in A30) and shorter pedipalp femora (112.5-122.5 in A33, 137.5 in A30). Female T. nortoni can be differentiated from female T. mulleni by having a shorter medial suture (10-12.5 in A33; 20-22.5 in A31) and a shorter genital field (177.5-192.5 in A33, 195-205 in A31). Male T. nortoni can be differentiated from male T. mulleni by having shorter pedipalp femora (85-93 in T. nortoni, 97-103 in T. mulleni). Additionally, T. nortoni can be differentiated from T. mulleni by being distributed in California, instead of in the Rocky Mountains (Idaho, Montana, Utah and Wyoming). Female T. nortoni can be differentiated from female T. walteri by having slightly longer pedipalp femora with respect to genua (1.69-1.82 in T. nortoni, 1.52–1.64 in T. walteri) and slightly more elongate anterio-medial platelets (2.74-3.06 in T. nortoni, 2.58-2.72 in T. walteri). Male T. nortoni can be differentiated from male T. walteri by having longer pedipalp femora (85–92.5 in T. nortoni, 95–100 in T. walteri) and slightly more elongate pedipalp tibiae (2.73–3.0 in T. nortoni, 3.05-3.10 in T. walteri).

Description. FEMALE (Figure 168) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (570–645 (580) long; 420–480 (435) wide) ovoid with faint orange coloration or colorless. Anterio-medial platelets (122.5–131.25 (125) long; 40–47.5 (42.5) wide). Anterio-lateral platelets (155–180 (162.5) long; 50–57.5 (57.5) wide) fused to dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 295–320 (310)). Dorsal plate proportions: dorsum length/

Figure 167. Torrenticola nortoni sp. n. distribution.

width 1.31–1.36 (1.33); dorsal width/distance between Dgl-4 1.40–1.50 (1.40); anterio-medial platelet length/width 2.74–3.06 (2.94); anterio-lateral platelet length/ width 2.83–3.20 (2.83); anterio-lateral/anterio-medial length 1.22–1.38 (1.30).

Gnathosoma — **Subcapitulum** (310–330 (325) long (ventral); 232.5–243.25 (240) long (dorsal); 132.5–140 (132.5) tall) colorless. Rostrum (125–130 (130) long; 43.75–50 (45) wide). Chelicerae (315–325 (325) long) with curved fangs (60–66 (60) long). Subcapitular proportions: ventral length/height 2.34–2.45 (2.45); rostrum length/width 2.60–2.89 (2.89). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–50 (45) long); femur (112.5–122.5 (120) long); genu (62.5–72.5 (70) long); tibia (80–90 87.5) long; 25–28.75 (26.25) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.69–1.82 (1.71); tibia/femur 0.71–0.73 (0.73); tibia length/width 3.13–3.33 (3.33).

Venter — (710–760 (730) long; 470–560 (490) wide) colorless. Gnathosomal bay (152.5–167.5 (167.5) long; 81.25–95 (85) wide). Cxgl-4 subapical. **Medial suture** (10–12.5 (12.5) long). **Genital plates** (177.5–192.5 (182.5) long; 160–182.5 (160) wide). Additional measurements: Cx-1 (270–281 (280) long (total); 110–124 (110) long (medial)); Cx-3 (300–365 (320) wide); anterior venter (157.5–177.5 (157.5) long). Ventral proportions: gnathosomal bay length/width 1.61–1.97 (1.97); anterior venter/genital field length 0.86–0.92 (0.86); anterior venter length/genital field width 0.97–0.98 (0.98); anterior venter/medial suture 12.6–17.75 (12.6).

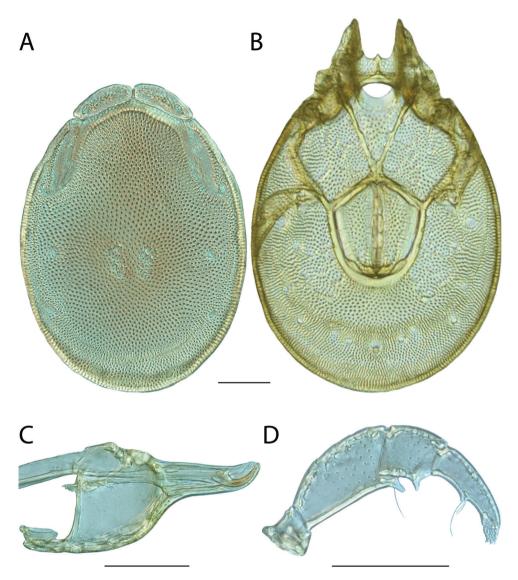

Figure 168. *Torrenticola nortoni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

MALE (Figure 169) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (450–500 (455) long; 310–380 (320) wide) ovoid with faint orange coloration or colorless. Anterio-medial platelets (97.5–105 (102.5) long; 35–37.5 (37.5) wide). Anterio-lateral platelets (127.5–145 (137.5) long; 45–53.75 (45) wide) fused to dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 240–285 (245)). Dorsal plate proportions: dorsum length/ width 1.32–1.45 (1.42); dorsal width/distance between Dgl-4 1.29–1.37 (1.31); an-

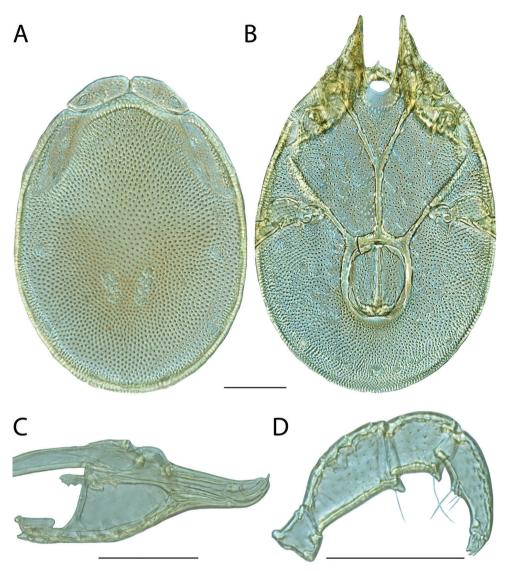

Figure 169. *Torrenticola nortoni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

terio-medial platelet length/width 2.67–2.80 (2.73); anterio-lateral platelet length/ width 2.60–3.06 (3.06); anterio-lateral/anterio-medial length 1.28–1.44 (1.34).

Gnathosoma — **Subcapitulum** (250–267.5 (252.5) long (ventral); 180–195 (192.5) long (dorsal); 95–107.5 (97.5) tall) colorless. Rostrum (97.5–105 (105) long; 35–37.5 (37.5) wide). Chelicerae (246–260 (250) long) with curved fangs (45–52 (50) long). Subcapitular proportions: ventral length/height 2.49–2.63 (2.59); rostrum length/width 2.67–2.80 (2.80). **Pedipalps** with tuberculate ventral extensions on fem-

ora and genua. Palpomeres: trochanter (35–42.5 (37.5) long); femur (85–92.5 (92.5) long); genu (52.5–60 (56.25) long); tibia (66.25–75 (67.5) long; 22.5–27.5 (22.5) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.54–1.64 (1.64); tibia/femur 0.73–0.81 (0.73); tibia length/width 2.73–3.00 (3.00).

Venter — (560–620 (590) long; 350–431 (370) wide) colorless. Gnathosomal bay (106–128 (122.5) long; 65–67.5 (65) wide). Cxgl-4 subapical. **Medial suture** (82.5–110 (102.5) long). **Genital plates** (112.5–125 (115) long; 90–102.5 (90) wide). Additional measurements: Cx-1 (211–230 (230) long (total); 100–110 (110) long (medial)); Cx-3 (260–292 (270) wide); anterior venter (232.5–250 (240) long). Ventral proportions: gnathosomal bay length/width 1.60–1.89 (1.88); anterior venter/genital field length 1.96–2.13 (2.09); anterior venter length/genital field width 2.39–2.67 (2.67); anterior venter/medial suture 2.18–2.82 (2.34).

IMMATURES unknown.

Etymology. Specific epithet (*nortoni*) named in honor of acarologist Roy Norton who taught JRF oribatids during the Soil Mite Course at The Ohio State University Acarology Summer Program; specifically for his talent in weaving biological stories into his lessons.

Distribution. California (Figure 167).

Remarks. *Torrenticola nortoni* groups with other members of the Rusetria Complex with high support and specimens are less than 2% different in COI sequence from each other. In the all analyses, *T. mulleni* groups with the three other members of the Rusetria Complex that are found in western North America: *T. mulleni*, *T. walteri*, and *T. welbourni*. These species are 5–7% different in COI sequence from each other and together make up the Western 2-Plate Identification Group. *Torrenticola nortoni* is one of three of these that occur in California (including *T. walteri* and *T. welbourni*).

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola occidentalis (Marshall, 1933)

Atractides occidentalis Marshall, 1933: 40. *Torrenticola occidentalis* Mitchell, 1954: 40.

Material examined. HOLOTYPE (\bigcirc): from USA, Wyoming, Medicine Bow National Forest, 1928, by JW Scott, RM280072.

Type deposition. Holotype (\bigcirc) deposited in the CNC.

Diagnosis. *Torrenticola occidentalis* are similar to other members of the Ellipsoidalis Group (*T. ellipsoidalis, T. multiforma*, and *T. leviathan*), and in being among the largest *Torrenticola* in the west (dorsum length $\mathcal{Q} = 700-885$; $\mathcal{J} = 665-850$), although *T. sierrensis* are also large (dorsum length $\mathcal{Q} = 700-880$; $\mathcal{J} = 590-735$) but can easily be distinguished from the Ellipsoidalis Group by being circular instead of ellipsoid or

Figure 170. Torrenticola occidentalis distribution.

rectangular (dorsum length/width = 1.17-1.28 in *T. sierrensis*, 1.30-1.67 in Ellipsoidalis Group). *T. occidentalis* can be differentiated from *T. ellipsoidalis* by having a shorter medial suture (20 in *T. occidentalis*, 40–57.5 in *T. ellipsoidalis*) and by having more elongate anterio-lateral platelets (length/width = 2.54 in *T. occidentalis*, 2.00-2.39in *T. ellipsoidalis*). *T. occidentalis* can be differentiated from *T. multiforma* by having stockier subcapitular rostra (length/width = 2.15 in *T. occidentalis*, 2.5-2.8 in *T. multiforma*). *T. occidentalis* can be differentiated from *T. leviathan* by having less elongate pedipalpal tibiae (length/width = 3.33 in *T. occidentalis*, 3.43-4.20 in *T. leviathan*) and a shorter dorsum (length \Im = 770 in *T. occidentalis*, 845-870 in *T. leviathan*).

Re-description. FEMALE (Figure 171) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum— (770 long; 590 wide) ellipsoid with pink coloration without a distinct pattern. Anterio-medial platelets (145 long; 76.25 wide). Anterio-lateral platelets (235 long; 92.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 455). Dorsal plate proportions: dorsum length/width 1.31; dorsal width/distance between Dgl-4 1.30; anterio-medial platelet length/width 1.90; anterio-lateral platelet length/width 2.54; anterio-lateral/ anterio-medial length 1.62.

Gnathosoma — **Subcapitulum** (370 long (ventral); 282.5 long (dorsal); 170 tall) colorless. Rostrum (145 long; 67.5 wide) short. Chelicerae (370 long) with curved fangs (75 long). Subcapitular proportions: ventral length/height 2.18; rostrum length/

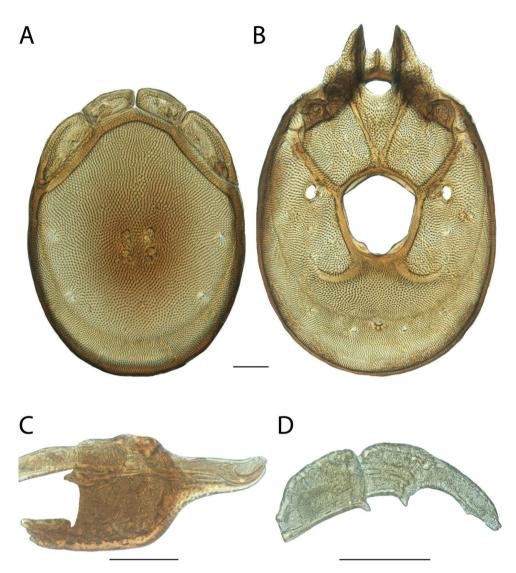

Figure 171. *Torrenticola occidentalis* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

width 2.15. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (50 long); femur (127.5 long); genu (87.5 long); tibia (100 long; 30 wide); tarsus (15 long). Palpomere proportions: femur/genu 1.46; tibia/femur 0.78; tibia length/width 3.33.

Venter — (980 long; 660 wide) colorless. Gnathosomal bay (202.5 long; 97.5 wide). Cxgl-4 subapical. Medial suture (20 long). Genital plates (235 long; 210 wide). Additional measurements: Cx-1 (385 long (total); 180 long (medial)); Cx-3 (430 wide); anterior venter (217.5 long). Ventral proportions: gnathosomal bay

length/width 2.08; anterior venter/genital field length 0.93; anterior venter length/ genital field width 1.04; anterior venter/medial suture 10.88.

MALE unknown.

IMMATURES unknown.

Etymology. Marshall (1933) did not specify an etymology for the specific epithet (*occidentalis*). However, surely this name refers to the type locality of this species in western United States (*occidens*, L. direction of the setting sun, west).

Distribution. Known only from South-central Wyoming (Medicine Bow National Forest) (Figure 170), from a single female collected from trout stomach contents.

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola occidentalis* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine the holotype. Based upon overall similarity and a short, conical rostrum, we place this species in the Miniforma Complex and the Ellipsoidalis Identification Group

Torrenticola oliveri Fisher & Dowling, sp. n. http://zoobank.org/B5AF53E5-22E6-4E2B-82CE-36FA1291E914

Material examined. HOLOTYPE (\bigcirc): from USA, Oregon, Curry County, Siskiyou National Forest; beside Road #33 between Powers and Agness, (42°39'39"N, 124°4'4"W), 2 July 1983, by IM Smith, IMS830019.

PARATYPES (4 \bigcirc ; 4 \circlearrowright): **California, United States**: 1 \bigcirc and 1 \circlearrowright from Mendocino County, beside Rt. 1, 3.6 km southwest of Rt. 101, (39°51'51"N, 123°44'44"W), 5 August 1987, by IM Smith, IMS870130 • 1 \bigcirc and 1 \circlearrowright from Trinity County, beside Rt. 36, 5.2 km west of Forest Glen Station, (40°23'23"N, 123°21'21"W), 6 August 1987, by IM Smith & JD Smith, IMS870132 • **Oregon, United States**: 1 \circlearrowright (ALLO-TYPE) from Curry County, Siskiyou National Forest; beside Road #33 between Powers and Agness, (42°39'39"N, 124°4'4"W), 2 July 1983, by IM Smith, IMS830019 • 1 \bigcirc from Curry County, Port Orford; Humbug Mountain State Park Picnic Area off Rt. 101, (42°41'41"N, 124°26'26"W), 1 July 1983, by IM Smith, IMS830013 • 1 \circlearrowright from Curry County, Port Orford; Humbug Mountain State Park Picnic Area off Rt. 101, (42°41'41"N, 124°25'25"W), 1 July 1983, by IM Smith, IMS830012 • **Washington, United States**: 1 \bigcirc from Pierce County, Mt. Rainier National Park; Sunshine Point Campground, (46°44'44"N, 121°54'54"W), 30 June 1976, by IM Smith, IMS760177.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 2 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \textcircled{O})$ deposited in the ACUA.

Diagnosis. *Torrenticola oliveri* are similar to members of the Miniforma group (*T. copipalpa*, *T. manni*, *T. miniforma*, *T. pacificensis*, *T. rockyensis*, and *T. pinocchio*) in having similar pedipalpal extensions (unique to members of this group). *T. oliveri* can be differentiated from all other members of Miniforma Complex by having a longer anterior venter (250–310 in *T. oliveri*, 173–235 in others) and more elongate pedipalpal tibiae (length/width = 3.68–4.13 in *T. oliveri*, 2.47–3.50 in others).

Figure 172. Torrenticola oliveri sp. n. distribution.

Description. FEMALE (Figure 173) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (615–710 (645) long; 480–545 (490) wide) ovoid with faint pink coloration without a distinct pattern. Anterio-medial platelets (125–157.5 (130) long; 65–75 (65) wide). Anterio-lateral platelets (210–245 (210) long; 75–87.5 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 370–430 (395)). Dorsal plate proportions: dorsum length/width 1.27–1.34 (1.32); dorsal width/distance between Dgl-4 1.24–1.30 (1.24); anterio-medial platelet length/width 1.92–2.10 (2.00); anterio-lateral platelet length/width 2.63–2.97 (2.80); anterio-lateral/anterio-medial length 1.56–1.68 (1.62).

Gnathosoma — **Subcapitulum** (370–397.5 (397.5) long (ventral); 285–297.5 (297.5) long (dorsal); 112.5–122.5 (117.5) tall) colorless. Rostrum (150–160 (160) long; 47.5–50 (50) wide). Chelicerae (380–415 (415) long) with curved fangs (55–65 (60) long). Subcapitular proportions: ventral length/height 3.08–3.38 (3.38); rostrum length/width 3.00–3.20 (3.20). **Pedipalps** with tuberculate ventral extensions on femora and dentate, tuberculate ventral extensions on genua. Palpomeres: trochanter (33.75–37.5 (37.5) long); femur (110–118.75 (118.75) long); genu (75–83.75 (83.75) long); tibia (80–87.5 (85) long; 20–23.75 (22.5) wide); tarsus (12.5–15 (15) long). Palpomere proportions: femur/genu 1.38–1.53 (1.42); tibia/femur 0.72–0.75 (0.72); tibia length/width 3.68–4.00 (3.78).

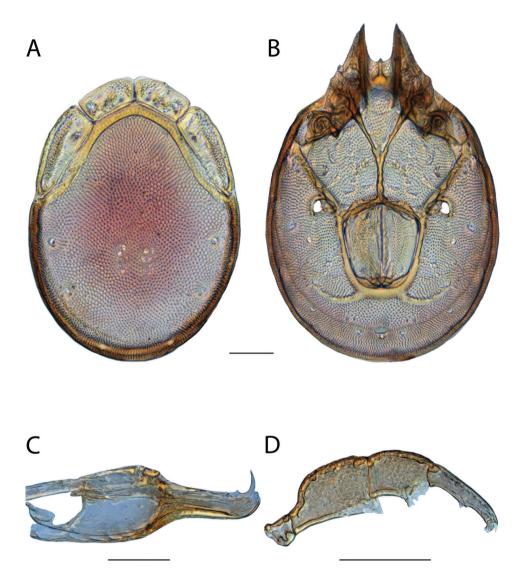

Figure 173. *Torrenticola oliveri* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Venter — (770–835 (805) long; 550–650 (580) wide) with faint pink coloration. Gnathosomal bay (155–167.5 (167.5) long; 70–90 (72.5) wide). Cxgl-4 subapical. **Medial suture** (80–95 (80) long). **Genital plates** (190–205 (205) long; 170–180 (180) wide). Additional measurements: Cx-1 (320–340 (320) long (total); 140–185 (155) long (medial)); Cx-3 (340–400 (360) wide); anterior venter (250–290 (250) long). Ventral proportions: gnathosomal bay length/width 1.75–2.31 (2.31); anterior venter/genital field length 1.22–1.45 (1.22); anterior venter length/genital field width 1.39–1.63 (1.39); anterior venter/medial suture 2.86–3.38 (3.13).

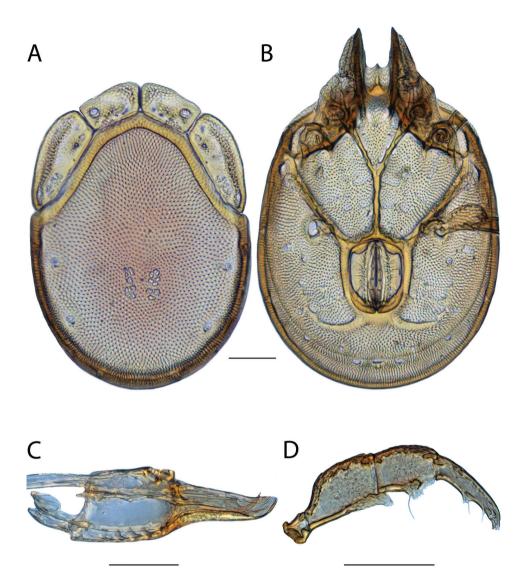

Figure 174. *Torrenticola oliveri* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

MALE (Figure 174) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (575–640 (590) long; 445–470 (470) wide ovoid with faint pink coloration without a distinct pattern. Anterio-medial platelets (125–140 (125) long; 60–75 (60) wide). Anterio-lateral platelets (205–220 (220) long; 65–90 (80) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 355–375 (375)). Dorsal plate proportions: dorsum length/width 1.26–1.39 (1.26); dorsal width/distance between Dgl-4 1.25–1.28 (1.25); anterio-medial

platelet length/width 1.87–2.17 (2.08); anterio-lateral platelet length/width 2.39–3.15 (2.75); anterio-lateral/anterio-medial length 1.54–1.76 (1.76).

Gnathosoma — **Subcapitulum** (325–367.5 (355) long (ventral); 260–285 (262.5) long (dorsal); 105–110 (110) tall) colorless. Rostrum (135–145 (135) long; 45–47.5 (45) wide). Chelicerae (350–410 (365) long) with curved fangs (55–55 (55) long). Subcapitular proportions: ventral length/height 3.10–3.34 (3.23); rostrum length/width 3.00–3.11 (3.00). Pedipalps with tuberculate ventral extensions on femora and dentate, tuberculate ventral extensions on genua. Palpomeres: trochanter (32.5–35 (35) long); femur (105–107.5 (107.5) long); genu (75–80 (80) long); tibia (82.5–90 (87.5) long; 20–22.5 (21.25) wide); tarsus (12.5–15 (15) long). Palpomere proportions: femur/genu 1.34–1.40 (1.34); tibia/femur 0.79–0.86 (0.81); tibia length/ width 4.00–4.13 (4.12).

Venter — (725–795 (725) long; 515–540 (540) wide) with faint pink coloration. Gnathosomal bay (142.5–150 (150) long; 60–70 (70) wide). Cxgl-4 subapical. **Medial suture** (105–130 (105) long). **Genital plates** (155–165 (160) long; 120–130 (130) wide). Additional measurements: Cx-1 (290–310 (295) long (total); 145–165 (150) long (medial)); Cx-3 (330–350 (350) wide); anterior venter (270–310 (270) long). Ventral proportions: gnathosomal bay length/width 2.14–2.40 (2.14); anterior venter/genital field length 1.69–1.88 (1.69); anterior venter length/genital field width 2.08–2.58 (2.08); anterior venter/medial suture 2.27–2.57 (2.57).

IMMATURES unknown.

Etymology. Specific epithet (*oliveri*) named in honor of comedian John Oliver and his team, whose commentary on *Last Week Tonight* breaches the realm of comedy and enters journalism. News and politics, like science, require both challenging misinformation and effectively communicating those challenges—tasks Oliver has humbly mastered.

Distribution. Pacific Northwest (Figure 172).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola oliveri* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, small size, distribution, and distinctive flange on pedipalpal genua place this species in the Miniforma Identification Group within the Miniforma Complex.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and most paratypes $(5 \bigcirc; 6 \circlearrowright)$ deposited in the CNC; other paratypes $(4 \heartsuit; 5 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola olliei are similar to other members of the Tricolor Complex (*T. bittikoferae*, *T. hoosieri*, *T. larvata*, *T. pearsoni*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, *T. unimaculata*, *T. cardia*, *T. kringi*, *T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. olliei* can be differentiated from most *Torrenticola*, including most

other members of the Tricolor Complex, by having a very short rostrum (length/width = 1.56–1.81 in *T. olliei*, 1.80–3.13 in others), except *T. bittikoferae* (1.81–1.9) and *T. dimorpha* (1.3–1.6). Additionally, males have a shorter anterior venter than all other Tricolor Complex ($\mathcal{J} = 205-225$ in *T. olliei*, 230–335 in others), except *T. kringi* (220–255), and both males and females have a wider genital field than most other Tricolor Complex ($\mathcal{Q} = 190-202.5$ in *T. olliei*, 145–180 in others; $\mathcal{J} = 130-137.5$ in *T. olliei*, 92.5–120 in others) except for *T. sierrensis* ($\mathcal{Q} = 180-212.5$; $\mathcal{J} = 135-175$) and female *T. leviathan* (180–195). Finally, *T. olliei* can be differentiated from most Tricolor Complex, except for *T. sierrensis*, by being distributed in the west (all others are eastern).

Description. FEMALE (Figure 176) (n=5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (690–900 (690) long; 500–670 (500) wide) ovoid with orange coloration separated into posterior and anterior portions with faint orange medially. Anteriomedial platelets (130–172.5 (130) long; 60–80 (60) wide). Anterio-lateral platelets (190–235 (190) long; 70–92.5 (70) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 360– 470 (360)). Dorsal plate proportions: dorsum length/width 1.34–1.42 (1.38); dorsal width/distance between Dgl-4 1.31–1.43 (1.39); anterio-medial platelet length/width 1.95–2.23 (2.17); anterio-lateral platelet length/width 2.34–2.71 (2.71); anterio-lateral/anterio-medial length 1.36–1.46 (1.46).

Gnathosoma — **Subcapitulum** (245–287.5 (245) long (ventral); 155–225 (155) long (dorsal); 137.5–152.5 (137.5) tall) colorless and tall. Rostrum (85–112.5 (85) long; 50–67.5 (50) wide) short and conical. Chelicerae (225–305 (225) long) with curved fangs (55–65 (55) long). Subcapitular proportions: ventral length/height 1.78–1.92 (1.78); rostrum length/width 1.62–1.76 (1.70). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–50 long); femur (87.5–122.5 (87.55) long); genu (58.75–82.5 (60) long); tibia (75–102.5 (75) long; 25–33.75 (25) wide); tarsus (25–30 (26.25) long). Palpomere proportions: femur/genu 1.46–1.51 (1.46); tibia/femur 0.84–0.90 (0.86); tibia length/width 3.00–3.08 (3.00).

Venter — (790–1050 (810) long; 550–765 (550) wide) colorless. Gnathosomal bay (120–170 (150) long; 75–97.5 (75) wide). Cxgl-4 subapical. **Medial suture** (12.5–50 (12.5) long). **Genital plates** (202.5–230 (212.5) long; 190–202.5 (190) wide). Additional measurements: Cx-1 (260–375 (280) long (total); 130–195 (130) long (medial)); Cx-3 (350–465 (350) wide); anterior venter (162.5–255 (162.5) long). Ventral proportions: gnathosomal bay length/width 1.37–2.00 (2.00); anterior venter/genital field length 0.76–1.11 (0.76); anterior venter length/genital field width 0.85–1.28 (0.86); anterior venter/medial suture 5.10–13.00 (13.00).

MALE (Figure 177) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (560–640 (570) long; 410–460 (410) wide) ovoid with orange coloration separated into posterior and anterior portions with faint orange medially. Anterio-medial platelets (102.5–125 (107.5) long; 50–70 (56.25) wide). Anterio-lateral

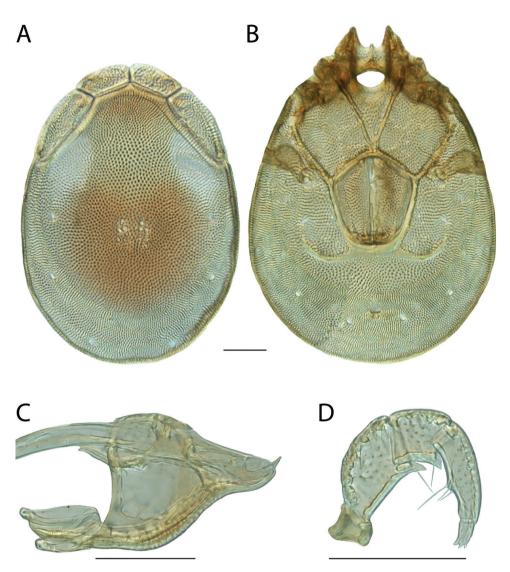

Figure 176. *Torrenticola olliei* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

platelets (170–187.5 (170) long; 62.5–80 (62.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–375 (320)). Dorsal plate proportions: dorsum length/width 1.33–1.44 (1.39); dorsal width/distance between Dgl-4 1.19–1.33 (1.28); anterio-medial platelet length/width 1.71–2.25 (1.91); anterio-lateral platelet length/width 2.34–2.72 (2.72); anterio-lateral/anterio-medial length 1.50–1.68 (1.58).

Gnathosoma — Subcapitulum (197.5–220 (212.5) long (ventral); 147.5–160 (159) long (dorsal); 115–125 (115) tall) colorless and tall. Rostrum (70–82.5 (72.5)

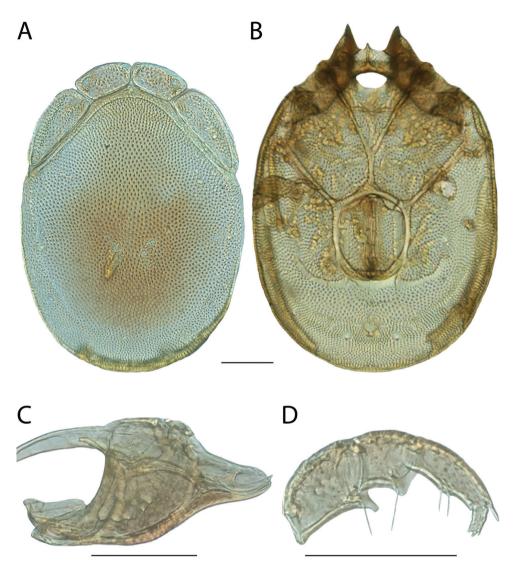

Figure 177. *Torrenticola olliei* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

long; 40–50 (40) wide) short and conical. Chelicerae (195–220 long) with curved fangs (47.5–52.5 long). Subcapitular proportions: ventral length/height 1.65–1.85 (1.85); rostrum length/width 1.56–1.81 (1.81). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (32.5–35 (32.5) long); femur (75–77.5 (76.25) long); genu (52.5–55 (52.5) long); tibia (67.5–75 (67.5) long; 22.5–25 (22.5) wide); tarsus (20–25 (20) long). Palpomere proportions: femur/genu 1.41–1.48 (1.45); tibia/femur 0.89–0.97 (0.89); tibia length/width 2.70–3.00 (3.00).

Venter — (650–710 (650) long; 444–530 (444) wide) colorless. Gnathosomal bay (122.5–137.5 (127.5) long; 62.5–75 (62.5) wide). Cxgl-4 subapical. **Medial suture** (70–80 (75) long). **Genital plates** (165–172.5 (165) long; 130–137.5 (130) wide). Additional measurements: Cx-1 (234–270 (235) long (total); 102–135 (102) long (medial)); Cx-3 (311–355 (312) wide); anterior venter (200–225 (207.5) long). Ventral proportions: gnathosomal bay length/width 1.70–2.04 (2.04); anterior venter/genital field length 1.19–1.30 (1.26); anterior venter length/genital field width 1.54–1.67 (1.60); anterior venter/medial suture 2.67–2.93 (2.77).

IMMATURES unknown.

Etymology. Specific epithet (*olliei*) named in honor of Ollie—pet Boston Terrier of JRF and DMF—whose brachycephaly resembles the short rostrum of this species, the shortest of all *Torrenticola*.

Distribution. Pacific coastal mountains (Figure 175).

Remarks. Torrenticola olliei groups with other members of the Tricolor Complex with high support in all analyses and group with *T. sierrensis* to form the western portion of this complex. Only one specimen was analyzed phylogenetically, so intraspecific variation remains unknown, but that specimen is greater than 6% different from all specimens of *T. sierrensis*. This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Torrenticola oregonensis Fisher & Dowling, sp. n. http://zoobank.org/4DD6B282-08DE-4B42-93F5-AEF20F62105A

Material examined. HOLOTYPE (\bigcirc): from USA, Oregon, Grant County, Prairie City; Strawberry Forest Camp, (44°19'19"N, 118°40'40"W), 17 June 1976, by IM Smith, IMS760126.

PARATYPES (3 \bigcirc ; 3 \bigcirc): **Oregon, USA**: 1 \bigcirc (ALLOTYPE) from Grant County, Prairie City; Strawberry Forest Camp, (44°19'19"N, 118°40'40"W), 17 June 1976, by IM Smith, IMS760126 • 1 \bigcirc from Benton County, Philomath; Marys Peak Campground, (44°30'30"N, 123°33'33"W), 23 June 1976, by IM Smith, IMS760147 • 2 \bigcirc from Benton County, Philomath; Marys Peak Campground, (44°30'30"N, 123°33'33"W), 27 June 1983, by IM Smith & AB Smith, IMS830006 • 1 \bigcirc from Benton County, Philomath; Marys Peak Campground, (44°30'30"N, 123°33'33"W), 27 June 1983, by IM Smith & AB Smith, IMS830006 • 1 \bigcirc from Benton County, Philomath; Marys Peak Campground, (44°30'30"N, 28 June 1983, by IM Smith, IMS830008 • 1 \bigcirc from Grant County, Prairie City; beside Rt. 26 just east of Dixie Pass, (44°32'32"N, 118°32'32"W), 17 June 1976, by IM Smith, IMS760125.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(2 \bigcirc; 1 \circlearrowright)$ deposited in the CNC; other paratypes $(1 \heartsuit; 1 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola oregonensis are similar to the other member of Tahoei group, *T. tahoei* by subcapitulum shape, having purple coloration restricted posteriorly and being distributed in the west and to members of the Nigroalba Group (*T. flangipalpa*, *T. nigroalba*, *T. solisorta*, and *T. dentirostra*) in having purple dorsal coloration

Figure 178. Torrenticola oregonensis sp. n. distribution.

restricted posteriorly. *T. oregonensis* can be differentiated from the Nigroalba Group by being larger (dorsum length Q = 760-840 in *T. oregonensis*, 475–565 in Nigroalba Group; $\Diamond = 690-820$ in *T. oregonensis*, 425–510 in Nigroalba Group) and distributed in Oregon (Nigroalba Group are eastern). *T. oregonensis* can be differentiated from *T. tahoei* by being larger (dorsum length Q = 760-840 in *T. oregonensis*, 600–720 in *T. tahoei*; $\Diamond = 690-820$ in *T. oregonensis*, 560–650 in *T. tahoei*; dorsum width Q = 560-640 in *T. oregonensis*, 430–515 in *T. tahoei*; $\Diamond = 520-605$ in *T. oregonensis*, 400–460 in *T. tahoei*) and a less elongate subcapitulum (ventral length/width = 2.63–2.74 in *T. oregonensis*, 3.25–4.11 in *T. tahoei*).

Description. FEMALE (Figure 179) (n = 4) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (760–840 (760) long; 560–640 (560) wide) ovoid with faint pink coloration medially, occasionally continuing posteriorly. Anterio-medial platelets (145–163.75 (145) long; 72.5–87.5 (72.5) wide). Anterio-lateral platelets (222.5–247.5 (222.5) long; 97.5–102.5 (100) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 435–495 (435)). Dorsal plate proportions: dorsum length/width 1.30–1.36 (1.36); dorsal width/distance between Dgl-4 1.27–1.29 (1.29); anterio-medial platelet length/width 1.85–2.21 (2.00); anterio-lateral platelet length/width 2.23–2.45 (2.23); anterio-lateral/anterio-medial length 1.48–1.56 (1.53).

Gnathosoma — **Subcapitulum** (380–415 (380) long (ventral); 280–307.5 (280) long (dorsal); 140–157.5 (140) tall) colorless. Rostrum (152.5–170 (152.5) long; 60–65 (60) wide). Chelicerae (380–425 (380) long) with curved fangs (70–75 (70) long). Subcapitular proportions: ventral length/height 2.63–2.71 (2.71); rostrum length/ width 2.48–2.62 (2.54). **Pedipalps** with tuberculate ventral extensions on femora and tuberculate extensions on genua that are slightly dentate. Palpomeres: trochanter (42.5–46.25 (42.5) long); femur (115–133.75 (115) long); genu (83.75–95 (83.75) long); tibia (100–110 (100) long; 25–27.5 (25) wide); tarsus (16.25–17.5 (17.5) long). Palpomere proportions: femur/genu 1.37–1.43 (1.37); tibia/femur 0.78–0.87 (0.87); tibia length/width 3.81–4.00 (4.00).

Venter — (900–990 (900) long; 660–750 (660) wide) colorless. Gnathosomal bay (170–185 (170) long; 75–100 (75) wide). Cxgl-4 subapical. **Medial suture** (60–80 (60) long). **Genital plates** (210–230 (210) long; 185–205 (185) wide). Additional measurements: Cx-1 (330–370 (330) long (total); 162.5–190 (170) long (medial)); Cx-3 (410–470 (410) wide); anterior venter (230–270 (230) long). Ventral proportions: gnathosomal bay length/width 1.80–2.27 (2.27); anterior venter/genital field length 1.04–1.22 (1.10); anterior venter length/genital field width 1.24–1.32 (1.24); anterior venter/medial suture 3.00–3.83 (3.83).

MALE (Figure 180) (n = 3) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (690–820 (820) long; 520–605 (605) wide) ovoid with faint pink coloration medially, occasionally continuing posteriorly. Anterio-medial platelets (140–155 (150) long; 67.5–82.5 (82.5) wide). Anterio-lateral platelets (215–247.5 (247.5) long; 87.5–102.5 (102.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 420–480 (480)). Dorsal plate proportions: dorsum length/width 1.33–1.36 (1.36); dorsal width/distance between Dgl-4 1.24–1.26 (1.26); anterio-medial platelet length/width 1.82–2.30 (1.82); anterio-lateral platelet length/width 2.25–2.46 (2.41); anterio-lateral/anterio-medial length 1.45–1.65 (1.65).

Gnathosoma — **Subcapitulum** (370–380 (380) long (ventral); 275–290 (290) long (dorsal); 135–140 (140) tall) colorless. Rostrum (145–150 (150) long; 52.5–60 (60) wide). Chelicerae (375–395 (395) long) with curved fangs (65–70 (70) long). Subcapitular proportions: ventral length/height 2.64–2.74 (2.71); rostrum length/ width 2.50–2.76 (2.50). **Pedipalps** with tuberculate ventral extensions on femora and tuberculate extensions on genua that are slightly dentate. Palpomeres: trochanter (40–43.75 (43.75) long); femur (115–127.5 (127.5) long); genu (82.5–87.5 (87.5) long); tibia (97.5–102.5 (102.5) long; 25–26.25 (26.25) wide); tarsus (15–16.25 (15) long). Palpomere proportions: femur/genu 1.31–1.46 (1.46); tibia/femur 0.80–0.85 (0.80); tibia length/width 3.90–3.90 (3.90).

Venter — (840–930 (930) long; 610–710 (710) wide) colorless. Gnathosomal bay (157.5–172.5 (157.5) long; 70–100 (100) wide). Cxgl-4 subapical. **Medial suture** (100–120 (120) long). **Genital plates** (165–175 (175) long; 130–140 (140) wide). Additional measurements: Cx-1 (330–340 (340) long (total); 160–180 (180) long

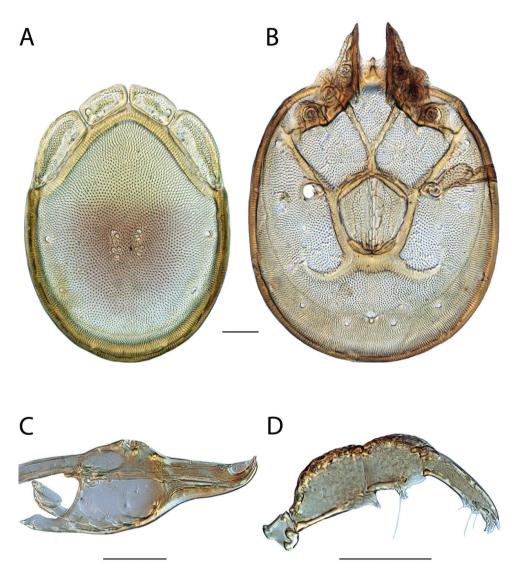

Figure 179. *Torrenticola oregonensis* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

(medial)); Cx-3 (390–455 (455) wide); anterior venter (275–325 (325) long). Ventral proportions: gnathosomal bay length/width 1.58–2.46 (1.58); anterior venter/genital field length 1.65–1.86 (1.86); anterior venter length/genital field width 2.11–2.32 (2.32); anterior venter/medial suture 2.71–2.75 (2.71).

IMMATURES unknown.

Etymology. Specific epithet (*oregonensis*) refers to the distribution of this species, which was paradoxically found in several ecoregions across Oregon, but not in surrounding areas.

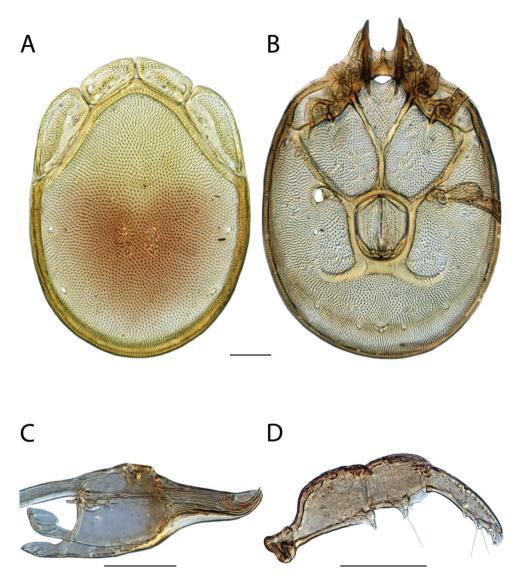

Figure 180. *Torrenticola oregonensis* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Distribution. Oregon (Figure 178).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola oregonensis* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. Due to its unique set of characteristics, we are unable to place this species into a species group or complex.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (29 \bigcirc ; 325 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola pacificensis are similar to members of the Miniforma group (T. copipalpa, T. manni, T. miniforma, T. rockyensis, T. oliveri, and T. pinocchio) in having short, stocky pedipalps (except T. oliveri and T. pinocchio); similar pedipalpal extensions (unique to members of this group); and being among the smallest Torrenticola in the west (dorsum 500-625 long) (except T. oliveri). T. pacificensis are best differentiated from *T. rockyensis* by females having a stockier rostrum (length/width Q= 2.59-2.68 in T. pacificensis, 2.72-2.91 in T. rockyensis); and by being distributed in the Pacific Coast Ranges of Washington and Oregon instead of the Rocky Mountains (Idaho & Montana). T. pacificensis are best differentiated from T. copipalpa by having tuberculate pedipalp femoral extensions (broad and flat in *T. copipalpa*) and by being distributed in the Pacific Coast Ranges of Washington and Oregon, whereas although T. pacificensis overlap, they are more southern (southwest Oregon & California). T. pacificensis are best differentiated from T. manni by having stockier tibiae (length/width = 2.67-3.00 in pacificensis, 3.13-3.38 in T. manni); having a stockier rostrum (length/ width Q = 2.59-2.68 in *T. pacificensis*, 3.00-3.13 in *T. manni*; $\mathcal{F} = 2.76-3.07$ in *T. pa*cificensis, 3.13–3.20 in T. manni); and by being distributed in the Pacific Coast Ranges of Washington and Oregon, whereas T. manni is only known from Catron County, New Mexico. T. pacificensis are best differentiated from T. miniforma by having stockier anterio-medial platelets (length/width = 2.00-2.16 in T. pacificensis, 2.44-2.65 in T. miniforma); stockier subcapitular rostra (length/width = 2.59-3.07 in T. pacificensis; 3.13-3.19 in T. miniforma); and by being distributed in the Pacific Coast Ranges of Washington and Oregon, whereas T. miniforma is only known from Humboldt County, California. T. pacificensis can be differentiated from T. oliveri by having a shorter anterior venter (177-235 in T. pacificensis, 250-310 in T. oliveri) and less elongate pedipalpal tibiae (length/width = 2.6–3.0 in *T. pacificensis*, 3.6–4.2 in *T. oliveri*). T. pacificensis can be differentiated from T. pinocchio by having a less elongate rostrum (length/width = 2.5-3.1 in T. pacificensis, 4.5-4.9 in T. pinocchio) and less elongate pedipalpal tibiae (length/width = 2.67–3.00 in *T. pacificensis*, 3.13–3.50 in *T. pinocchio*).

Description. FEMALE (Figure 182) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (530–625 (580) long; 335–430 (400) wide) ovoid with purple coloration restricted posteriorly. Anterio-medial platelets (100–117.5 (110) long; 47.5–55 (52.5) wide). Anterio-lateral platelets (145–170 (162.5) long; 52.5–63.75 (57.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between Dgl-4 270–345 (300)). Dorsal plate proportions: dorsum length/ width 1.42–1.58 (1.45); dorsal width/distance between Dgl-4 1.24–1.36 (1.33); anterio-medial platelet length/width 2.05–2.14 (2.10); anterio-lateral platelet length/width 2.63–2.95 (2.83); anterio-lateral/anterio-medial length 1.43–1.48 (1.48).

Gnathosoma — **Subcapitulum** (287.5–325 (300) long (ventral); 210–236 (225) long (dorsal); 110–125 (115) tall) colorless. Rostrum (110–127.5 (120) long; 41.25–47.5 (45) wide). Chelicerae (265–331 (305) long) with curved fangs (50–62 (52.5)

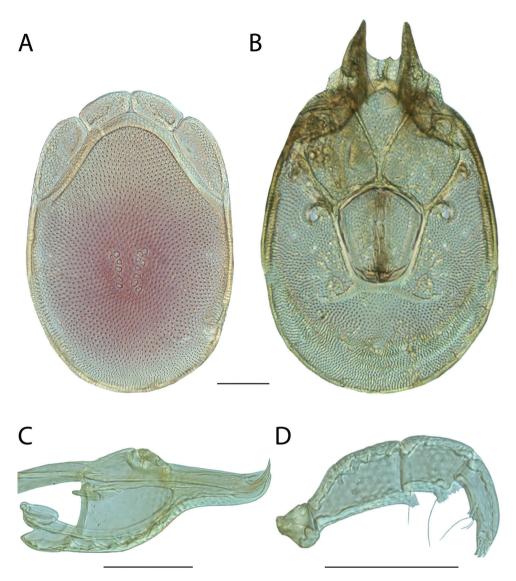

Figure 182. *Torrenticola pacificensis* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

long). Subcapitular proportions: ventral length/height 2.52–2.65 (2.61); rostrum length/width 2.59–2.68 (2.67). **Pedipalps** short and stocky (especially tibiae) with nearly tuberculate, dentate ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (30–35 (32.5) long); femur (85–95 (95) long); genu (57.5–67.5 (65) long); tibia (55–67.5 (62.5) long; 20–23.75 (22.5) wide); tarsus (12.5–17.5 (15) long). Palpomere proportions: femur/genu 1.40–1.48 (1.46); tibia/femur 0.65–0.71 (0.66); tibia length/width 2.71–3.00 (2.78).

Venter — (650–770 (720) long; 434–521 (440) wide) colorless or with faint purple coloration. Gnathosomal bay (122.5–142.5 (140) long; 66.25–87.5 (67.5) wide). Cxgl-4 subapical. **Medial suture** (47.5–55 (50) long). **Genital plates** (162.5–185 (180) long; 143.75–172.5 (160) wide). Additional measurements: Cx-1 (230–289 (250) long (total); 110–142 (120) long (medial)); Cx-3 (280–331 (280) wide); anterior venter (177.5–205 (182.5) long). Ventral proportions: gnathosomal bay length/ width 1.49–2.07 (2.07); anterior venter/genital field length 1.01–1.11 (1.01); anterior venter length/genital field width 1.07–1.23 (1.14); anterior venter/medial suture 3.38–3.89 (3.65).

MALE (Figure 183) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (525–590 (550) long; 355–375 (370) wide) ovoid with purple coloration restricted posteriorly. Anterio-medial platelets (97.5–115 (102.5) long; 47.5–55 (47.5) wide). Anterio-lateral platelets (147.5–162.5 (147.5) long; 52.5–57.5 52.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between Dgl-4 280–290 (290)). Dorsal plate proportions: dorsum length/width 1.48–1.57 (1.49); dorsal width/distance between Dgl-4 1.28–1.30 (1.28); anterio-medial platelet length/width 2.00–2.16 (2.16); anterio-lateral platelet length/width 2.73–2.83 (2.81); anterio-lateral/anterio-medial length 1.41–1.54 (1.44).

Gnathosoma — **Subcapitulum** (275–287.5 (285) long (ventral); 195–220 (212) long (dorsal); 103.75–115 (107.5) tall) colorless. Rostrum (107.5–117.5 (113.75) long; 35–42.5 (38.75) wide). Chelicerae (251–281 (273) long) with curved fangs (46–57 (47) long). Subcapitular proportions: ventral length/height 2.50–2.65 (2.65); rostrum length/width 2.76–3.07 (2.94). Pedipalps short and stocky (especially tibiae) with nearly tuberculate, dentate ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (30–32.5 (32.5) long); femur (82.5–90 (85) long); genu (57.5–65 (62.5) long); tibia (55–60 (57.5) long; 20–22.5 (21.25) wide); tarsus (15–16.25 (16.25) long). Palpomere proportions: femur/genu 1.36–1.50 (1.36); tibia/femur 0.65–0.68 (0.68); tibia length/ width 2.67–2.94 (2.71).

Venter — $(645-740 (740) \log 388-460 (431) wide) colorless or with faint purple coloration. Gnathosomal bay (120–140 (135) long; 60–75 (60) wide). Cxgl-4 sub-apical.$ **Medial suture**(82.5–87.5 (82.5) long).**Genital plates**(140–147.5 (140) long; 110–120 (113.75) wide). Additional measurements: Cx-1 (243–277 (277) long (total); 120–146 (125) long (medial)); Cx-3 (245–310 (300) wide); anterior venter (216.25–235 (220) long). Ventral proportions: gnathosomal bay length/width 1.60–2.25 (2.25); anterior venter/genital field length 1.50–1.59 (1.57); anterior venter length/genital field width 1.89–1.98 (1.93); anterior venter/medial suture 2.49–2.69 (2.67).

IMMATURES unknown.

Etymology. Specific epithet (*pacificensis*) refers to the distribution of this species in the Pacific Ranges of the Pacific Northwest. This location-based name reflects that locality is the best way to differentiate this species from others in the Miniforma Group, particularly *T. rockyensis*.

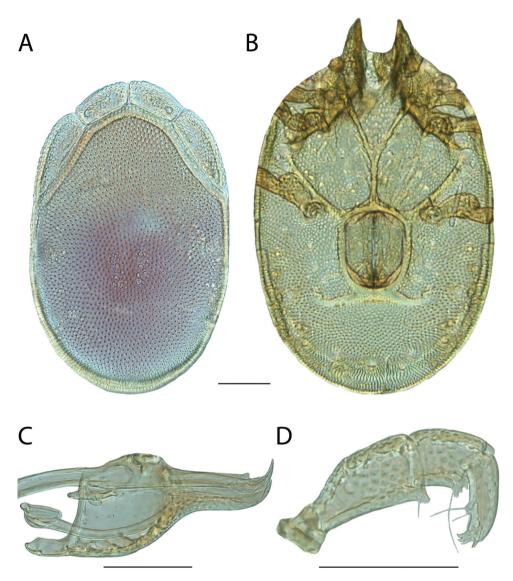

Figure 183. *Torrenticola pacificensis* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Distribution. Western Oregon and western Washington (Figure 181). It seems reasonable to suspect *T. pacificensis* also occurs in coastal British Columbia and northwestern California.

Remarks. Torrenticola pacificensis groups with other members of the Miniforma Complex with high support and specimens of this species are less than 1% different in COI sequence from each other. In all analyses, *T. pacificensis* groups with three other morphologically similar species: *T. rockyensis, T. manni*, and *T. copipalpa*. These three

species are greater than 4% different from each other in COI sequence. This species overlaps with *T. copipalpa* in west-central Oregon, but is the only member of the Miniforma group that occurs north of that point of overlap.

Based upon overall similarity, the pedipalp genu extensions, and western distribution, we were able to place this species in the Miniforma Identification Group.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola pearsoni Fisher & Dowling, sp. n. http://zoobank.org/F77CFD97-1A19-4B8F-B315-0786EE5F3892

Material examined. HOLOTYPE (\bigcirc): from USA, Arkansas, Montgomery County, Ouachita National Forest, South Fork Ouachita River, 29 Jul 2011, by AJ Radwell, & B Crump, AJR110302.

PARATYPES (7 \bigcirc ; 10 \bigcirc): Arkansas, USA: 2 \bigcirc and 3 \bigcirc from Montgomery County, Ouachita National Forest, South Fork Ouachita River, 29 Jul 2011, by AJ Radwell, & B Crump, AJR110302 • 1 ♀ from Newton County, Buffalo National River, Mill Creek (36°3'42.12"N, 93°8'7.62"W), 30 May 2012, by TD Edwards, TDE 12-0530-004 • 1 ♀ from Newton County, Buffalo National River, Mill Creek (36°3'42.12"N, 93°8'7.62"W), 20 Jun 2012, by TD Edwards, TDE 12-0620-004 • 1 9 from Newton County, Ozark-St Francis National Forest, Little Buffalo River, 11 Jul 2012, by TD Edwards, TDE 12-0711-004 • Missouri, USA: 1 👌 (ALLOTYPE) from Crawford County, Huzzah Creek, Red Bluff campground, east of Davisville, 23 Jul 2011, by IM Smith, IMS110029 • 1 d from Crawford County, Huzzah Creek, Red Bluff campground, east of Davisville, 23 Jul 2011, by IM Smith, IMS110029 • 2 I from McDonald County, Tiff City, beside Route 43, Buffalo Creek (36°40'17"N, 94°36'17"W), 2 May 1996, by IM Smith, IMS960004 • 1 ♀ and 1 ♂ from Oregon County, beside Route 19, north of Greer, Eleven Point (36°48'N, 91°20'W), 28 Jun 1987, by IM Smith, IMS870056 • **Oklahoma, USA**: 1 \bigcirc and 2 \bigcirc from Pushmataha County, beside Route 271, south of Albion, Walnut Creek (34°39'N, 95°7'W), 1 Jul 1987, by IM Smith, IMS870063A.

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and some paratypes $(4 \bigcirc; 5 \bigcirc)$ deposited in the CNC; other paratypes $(3 \heartsuit; 4 \bigcirc)$ deposited in ACUA.

Diagnosis. Torrenticola pearsoni are similar to other members of the Tricolor Complex (*T. bittikoferae*, *T. hoosieri*, *T. larvata*, *T. olliei*, *T. sierrensis*, *T. tricolor*, *T. trimaculata*, *T. unimaculata*, *T. cardia*, *T. kringi*, *T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. pearsoni* can be differentiated from most other Tricolor Complex (except *T. bittikoferae*, *T. hoosieri* and *T. dimorpha*) by having diffuse pink dorsal coloration, whereas most other members have bold patterning. *T. pearsoni* can be differentiated from *T. hoosieri* by having ventral extensions on the pedipalp femora and genua (lacking in *T. hoosieri*) and having stockier pedipalp tibiae (length/width = 3.0–3.3 in *T. pearsoni*,

Figure 184. Torrenticola pearsoni sp. n. distribution.

3.6–4.4 in *T. hoosieri*). Male *T. pearsoni* can be differentiated from *T. bittikoferae* (males only) by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 = 1.2–1.3 in *T. pearsoni*, 1.6–1.7 in *T. bittikoferae*); more elongate pedipalp tibiae (length/width = 3.1–3.3 in *T. pearsoni*, 2.7–2.8 in *T. bittikoferae*); and a more elongate rostrum (length/width = 2.1–2.4 in *T. pearsoni*, 1.8–1.9 in *T. bittikoferae*). *T. pearsoni* can be differentiated from *T. dimorpha* by having an unmodified dorsal plate (*T. dimorpha* has a dorsal plate medial extension covering nearly half the length of the anterio-medial plate-lets) and by males having unmodified pedipalps (male *T. dimorpha* have large, highly modified pedipalps which are expanded vertically and laterally).

Description. FEMALE (Figure 185) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (620–730 (620) long; 455–500 (455) wide) ellipsoid with faint pink coloration without a distinct pattern. Anterio-medial platelets (123.75–142.5 (123.75) long; 62.5–70 (62.5) wide). Anterio-lateral platelets (167.5–195 (167.5) long; 70–80 (72.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 365–395 (365)). Dorsal plate proportions: dorsum length/width 1.36–1.47 (1.36); dorsal width/distance between Dgl-4 1.21–1.30 (1.25); anterio-medial platelet length/width 1.93–2.04 (1.98); anterio-lateral platelet length/width 2.31–2.64 (2.31); anterio-lateral/anterio-medial length 1.34–1.42 (1.35).

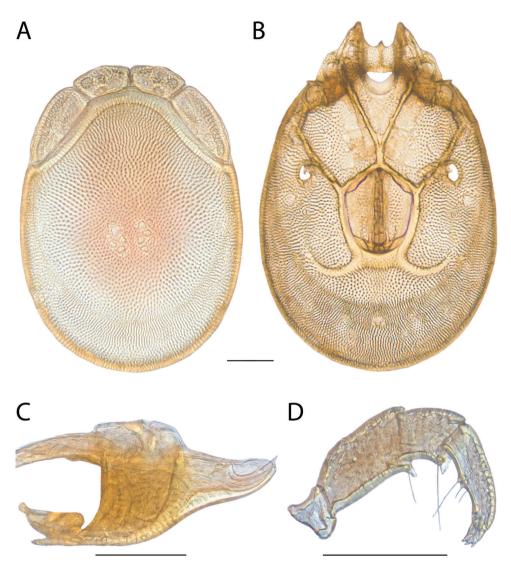

Figure 185. *Torrenticola pearsoni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Gnathosoma — **Subcapitulum** (247.5–290 (247.5) long (ventral); 170–210 (171) long (dorsal); 120–142.5 (120) tall) colorless. Rostrum (92.5–112.5 (92.5) long; 45–51.25 (45) wide) short and conical. Chelicerae (220–274 (221) long) with curved fangs (53–75 (64) long). Subcapitular proportions: ventral length/height 2.04–2.12 (2.06); rostrum length/width 2.06–2.25 (2.06). Pedipalps with tuberculate ventral extensions on femora and flat, flanged extensions on genua. Palpomeres: trochanter (37.5–50 (37.5) long); femur (96.25–120 (96.25) long); genu (57.5–75 (57.5) long); tibia (75–90 (75) long; 23.75–27.5 (23.75) wide); tarsus (20–25 (20)

long). Palpomere proportions: femur/genu 1.60–1.69 (1.67); tibia/femur 0.70–0.80 (0.78); tibia length/width 3.00–3.27 (3.16).

Venter — (742–802.75 (743) long; 505–610 (506) wide) colorless. Gnathosomal bay (117.5–145 (132.5) long; 80–100 (80) wide). Cxgl-4 subapical. **Medial suture** (27.5–42.5 (30) long). **Genital plates** (180–187.5 (182.5) long; 147.5–155 (147.5) wide). Additional measurements: Cx-1 (235–282 (260) long (total); 130–138 (137) long (medial)); Cx-3 (335–420 (336) wide); anterior venter (180–200 (187.5) long). Ventral proportions: gnathosomal bay length/width 1.26–1.69 (1.66); anterior venter/ genital field length 1.00–1.07 (1.03); anterior venter length/genital field width 1.18–1.33 (1.27); anterior venter/medial suture 4.53–6.55 (6.25).

MALE (Figure 186) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (620–675 (620) long; 430–495 (430) wide) ellipsoid with faint pink coloration without a distinct pattern. Anterio-medial platelets (117.5–127.5 (117.5) long; 62.5–75 (62.5) wide). Anterio-lateral platelets (172.5–195 (188.75) long; 67.5–82.5 (70) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 355–410 (360)). Dorsal plate proportions: dorsum length/width 1.34–1.44 (1.44); dorsal width/distance between Dgl-4 1.19–1.24 (1.19); anterio-medial platelet length/width 1.70–2.04 (1.88); anterio-lateral platelet length/width 2.36–2.70 (2.70); anterio-lateral/anterio-medial length 1.35–1.61 (1.61).

Gnathosoma — **Subcapitulum** (250–260 (260) long (ventral); 170–187 (186) long (dorsal); 112.5–117.5 (112.5) tall) colorless. Rostrum (92.5–102.5 (102.5) long; 42.5–46.25 (42.5) wide) short and conical. Chelicerae (225–244 (239) long) with curved fangs (55–63 (63) long). Subcapitular proportions: ventral length/height 2.20–2.31 (2.31); rostrum length/width 2.11–2.41 (2.41). **Pedipalps** with tuberculate ventral extensions on femora and flat, flanged extensions on genua. Palpomeres: trochanter (40–42.5 (42.5) long); femur (100–106.25 (106.25) long); genu (60–67.5 (67.5) long); tibia (75–85 (75) long; 23.75–26.25 (23.75) wide); tarsus (22.5–22.5 (22.5) long). Palpomere proportions: femur/genu 1.54–1.67 (1.57); tibia/femur 0.71–0.83 (0.71); tibia length/width 3.10–3.24 (3.16).

Venter — (720–800 (720) long; 461–588 (461) wide) colorless. Gnathosomal bay (110–130 (125) long; 70–87.5 (70) wide). Cxgl-4 subapical. **Medial suture** (107.5–135 (107.5) long). **Genital plates** (140–155 (152.5) long; 95–105 (95) wide). Additional measurements: Cx-1 (276–302 (283) long (total); 140–167 (140) long (medial)); Cx-3 (334–414 (334) wide); anterior venter (285–335 (285) long). Ventral proportions: gnathosomal bay length/width 1.26–1.79 (1.79); anterior venter/genital field length 1.87–2.18 (1.87); anterior venter length/genital field width 2.93–3.19 (3.00); anterior venter/medial suture 2.30–2.85 (2.65).

IMMATURES unknown.

Etymology. Specific epithet (*pearsoni*) named in honor of Pearson Dowling, son of APGD, for his unquenchable curiosity for all things big and small.

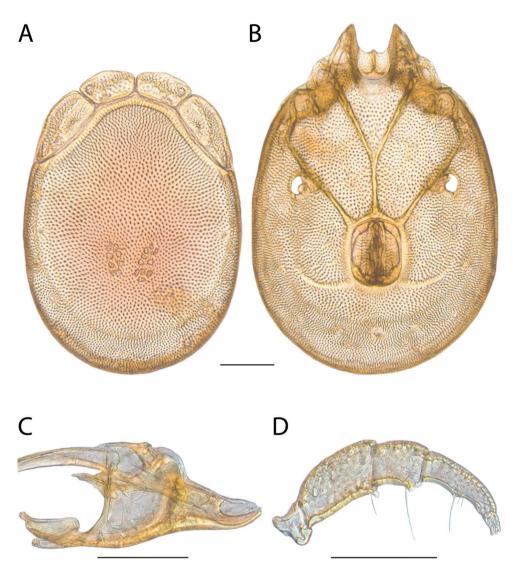

Figure 186. *Torrenticola pearsoni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Distribution. Interior Highlands of Missouri and Arkansas (Figure 184).

Remarks. *Torrenticola pearsoni* groups with other members of the Tricolor Complex in all analyses with high support and specimens are less than 2% different in COI sequence from each other. In the combined analysis, *T. pearsoni* groups with two other species (*T. hoosieri* and *T. projector*) with high support and these species are greater than 11% different from each other. Whereas most eastern members of the Tricolor Complex have distinctive patterns, this clade of three species contains members that lack dark patterns.

This species hypothesis is supported by low COI divergence within the species (0-2%), high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola pendula Fisher & Dowling, sp. n. http://zoobank.org/C4DF2AEE-F6DC-4DD7-84A1-53A392532968

Material examined. HOLOTYPE (\bigcirc): from USA, Maine, Washington County, Old Stream, off Route 9, 5.5 km west of Route 192 at Wesley, 6 June 2012, by IM Smith, IMS120012.

PARATYPES (1 \bigcirc ; 1 \circlearrowright): **Maine, USA**: 1 \circlearrowright (ALLOTYPE) from Washington County, Old Stream, off Route 9, 5.5 km west of Route 192 at Wesley, 6 June 2012, by IM Smith, IMS120012 • 1 \bigcirc from Washington County, Old Stream, off Route 9, 5.5 km west of Route 192 at Wesley, 6 June 2012, by IM Smith, IMS120012.

Type deposition. Holotype (\bigcirc), allotype (\bigcirc) deposited in the CNC; paratype (1 \bigcirc) deposited in the ACUA.

Diagnosis. Torrenticola pendula are similar to other members of the Rusetria "Eastern 2-Plates" group (T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malarkeyorum, T. sellersorum, T. tysoni, T. ululata, T. whitneyae, T. microbiscutella, T. feminellai) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except T. ululata and T. indistincta), and being distributed in the east. It is one of only four Eastern 2-Plates that have dark, bold, bluish-purple coloration (also T. tysoni, T. biscutella, and T. sellersorum). T. pendula can be differentiated from other Eastern 2-Plates (except T. whitneyae and T. fem*inellai*) by having a more elongate gnathosomal bay (2.42–2.9 in *T. pendula*, 1.4–2.24 in others) and often by having a dorsal pattern of dark bluish-purple separated into anterior and posterior portions connected medially. In the Rusetria Complex only T. whitneyae and T. magnexa (rarely) has a similar pattern. T. pendula can be differentiated from T. magnexa by having anterio-medial platelets fully fused to the dorsal plate (anterio-lateral platelets partially fused to the dorsal plate in T. magnexa). T. pendula can be differentiated from T. whitneyae by having a more elongate rostrum (length/ width = 2.87-3.06 in T. pendula, 2.41-2.69 in T. whitneyae). T. pendula can be differentiated from *T. feminellai* by having less elongate pedipalpal tibiae (length/width = 2.78-3.05 in T. pendula; 3.63-4.11 in T. feminellai).

Description. FEMALE (Figure 188) (n = 2) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (630–650 (630) long; 490–490 (490) wide) ovoid with bold purple coloration both anteriorly and posteriorly connected medially. Anterio-medial platelets (145–145 (145) long; 45–47.5 (47.5) wide). Anterio-lateral platelets (170–177.5 (170) long; 62.5–75 (62.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 350–350 (350)). Dorsal plate proportions: dorsum length/width 1.29–1.33 (1.29); dorsal width/distance

Figure 187. Torrenticola pendula sp. n. distribution.

between Dgl-4 1.40–1.40 (1.40); anterio-medial platelet length/width 3.05–3.22 (3.05); anterio-lateral platelet length/width 2.37–2.72 (2.72); anterio-lateral/anterio-medial length 1.17–1.22 (1.17).

Gnathosoma — **Subcapitulum** (320–335 (335) long (ventral); 242–252 (252) long (dorsal); 147.5–147.5 (147.5) tall) colorless. Rostrum (127.5–137.5 (137.5) long; 42.5–45 (45) wide). Chelicerae (336–347 (347) long) with curved fangs (53–62 (62) long). Subcapitular proportions: ventral length/height 2.17–2.27 (2.27); rostrum length/width 3.00–3.06 (3.06). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–47.5 (47.5) long); femur (102.5–107.5 (102.5) long); genu (67.5–71.25 (67.5) long); tibia (72.5–75 (75) long; 23.75–25 (25) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.51–1.52 (1.52); tibia/femur 0.67–0.73 (0.73); tibia length/width 3.00–3.05 (3.00).

Venter — (770–800 (770) long; 532–557 (557) wide) with bold purple coloration. Gnathosomal bay (187.5–195 (195) long; 75–77.5 (75) wide). Cxgl-4 subapical. **Medial suture** (10–12.5 (12.5) long). **Genital plates** (180–186.25 (186.25) long; 168.75–172.5 (168.75) wide). Additional measurements: Cx-1 (290–301 (290) long (total); 110–115 (115) long (medial)); Cx-3 (345–350 (346) wide); anterior venter (145–157.5 (145) long). Ventral proportions: gnathosomal bay length/width 2.42–2.60 (2.60); anterior venter/genital field length 0.78–0.88 (0.78); anterior venter length/genital field width 0.86–0.91 (0.86); anterior venter/medial suture 11.60–15.75 (11.60).

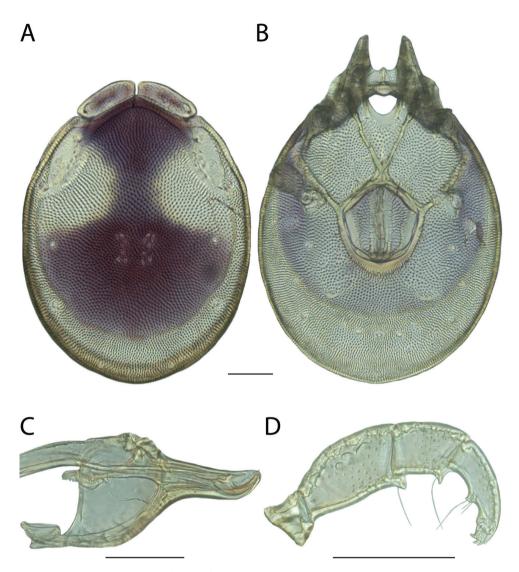

Figure 188. *Torrenticola pendula* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

MALE (Figure 189) (n = 1) (allotype only) with characters of the genus with following specifications.

Dorsum — (500 long; 380 wide) ovoid with bold purple coloration separated into anterior and posterior portions. Anterio-medial platelets (130 long; 41.25 wide). Anterio-lateral platelets (155 long; 62.5 wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 275). Dorsal plate proportions: dorsum length/width 1.32; dorsal width/distance between

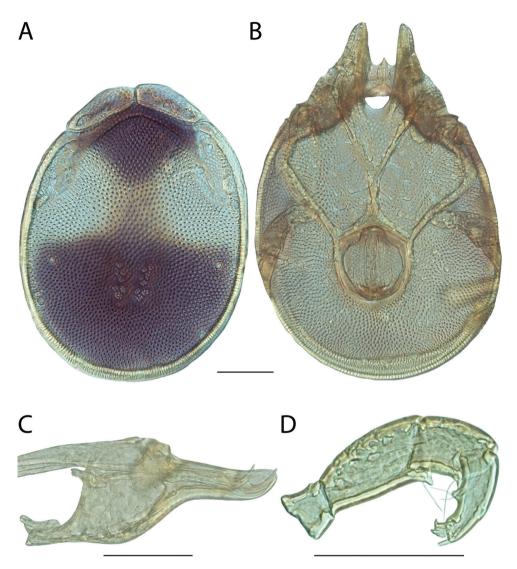

Figure 189. *Torrenticola pendula* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Dgl-4 1.38; anterio-medial platelet length/width 3.15; anterio-lateral platelet length/ width 2.48; anterio-lateral/anterio-medial length 1.19.

Gnathosoma — **Subcapitulum** (272.5 long (ventral); 197.5 long (dorsal); 110 tall) colorless. Rostrum (107.5 long; 37.5 wide). Chelicerae (280 long) with curved fangs 50 long). Subcapitular proportions: ventral length/height 2.48; rostrum length/ width 2.87. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (38.75 long); femur (85 long); genu (58.75 long); tibia (62.5

long; 22.5 wide); tarsus (15 long). Palpomere proportions: femur/genu 1.45; tibia/ femur 0.74; tibia length/width 2.78.

Venter — (620 long; 430 wide) with faint purple coloration. Gnathosomal bay (152.5 long; 52.5 wide). **Medial suture** (72.5 long). Cxgl-4 subapical. **Genital plates** (126.25 long; 120 wide). Additional measurements: Cx-1 (250 long (total); 100 long (medial)); Cx-3 (300 wide); anterior venter (207.5 long). Ventral proportions: gnathosomal bay length/width 2.90; anterior venter/genital field length 1.64; anterior venter length/genital field width 1.73; anterior venter/medial suture 2.86.

IMMATURES unknown.

Etymology. Specific epithet (*pendula*) named for the swinging torture axe described in "The Pit and the Pendulum" by Edgar Allan Poe, most artistic depictions of which resemble the dorsal patterning on this species.

Distribution. Known only from Washington County, Maine (Figure 187).

Remarks. *Torrenticola pendula* groups with other members of the Rusetria Complex with high support. The two specimens (one male and one female) are 6.7% different in COI sequence from each other, suggesting each represents a separate species. However, in addition to similar overall appearance and occurring in the same sample, they also are indistinguishable in characters that are not usually sexually dimorphic (e.g., pedipalp proportions). Because of this, we consider these two specimens as the same species, despite the high COI variability.

In all analyses, *T. pendula* groups with other eastern members of the Rusetria Complex that have posterio-lateral platelets fused with the dorsal shield, but in both analyses the position of this species within that clade was not well-supported. This species was 17–18% different in COI sequence from sister species.

Based upon overall similarity, fusion of the lateral platelets with the dorsal shield, phylogenetic position, and distribution, we were able to place this species in the Eastern 2-Plate Identification Group.

This species hypothesis is supported by phylogenetic affinity, high divergence between species (17-18%), and by the morphological characters outlined in the diagnosis.

Torrenticola pinocchio Fisher & Dowling, sp. n. http://zoobank.org/D8162FB2-4C67-4E20-9FA4-B8991E87B21F

Material examined. HOLOTYPE (\bigcirc): from USA, California, Mendocino County, beside Rt. 128, 7.3 km south of Boonville, (38°57'57"N, 123°19'19"W), 4 August 1987, by IM Smith, IMS870126A

PARATYPES (3 \bigcirc ; 2 3): **California, USA**: 1 3 (ALLOTYPE) from Mendocino County, beside Rt. 128, 7.3 km south of Boonville, (38°57'57"N, 123°19'19"W), 4 August 1987, by IM Smith, IMS870126A • 1 \bigcirc from Trinity County, beside Rt. 36 at Forest Glen Station Campground, (40°23'23"N, 123°20'20"W), 6 August 1987, by IM Smith & JD Smith, IMS870131 • Oregon, USA: 1 \bigcirc and 1 3 from Curry County, Port Orford; Butler Bar Campground off Elk River Road, (42°43'43"N, 124°16'16"W), 25

Additional measurements: Cx-1 (240–240 (240) long (total); 110–125 (110) long (medial)); Cx-3 (260–280 (260) wide); anterior venter (210–225 (210) long). Ventral proportions: gnathosomal bay length/width 2.29–2.50 (2.50); anterior venter/genital field length 1.79–1.80 (1.79); anterior venter length/genital field width 2.15–2.25 (2.15); anterior venter/medial suture 2.63–2.65 (2.63).

IMMATURES unknown.

Etymology. Specific epithet (*pinocchio*) refers to the elongate rostrum of this species, which resembles the ever-growing nose of Pinocchio (noun in apposition), a fictional character from the popular Italian children's novel, *The Adventures of Pinocchio* by Carlo Collodi (1883). Pinocchio is well-known for his nose, which grows every time he tells a lie.

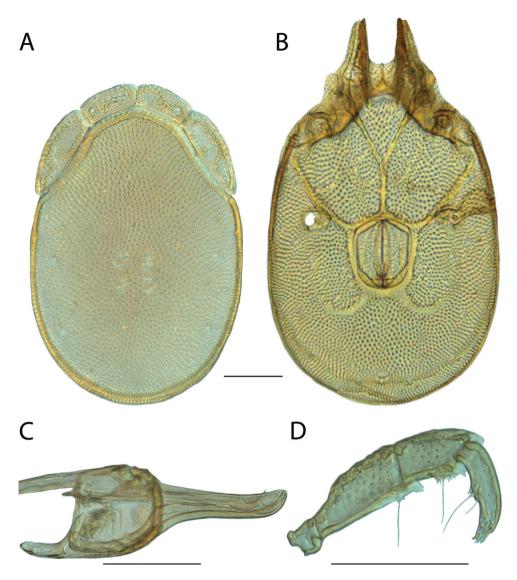

Figure 192. *Torrenticola pinocchio* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Distribution. California and Oregon (Figure 190).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola pinocchio* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, small size, dentate flange on the pedipalpal genua, and distribution, are consistent with placing this species in the Miniforma Complex and Miniforma Identification Group.

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and other paratypes $(2 \heartsuit; 5 \heartsuit)$ deposited in the CNC; other paratypes $(2 \heartsuit; 5 \heartsuit)$ deposited in ACUA.

Diagnosis. Torrenticola pollani are similar to other members of the Rusetria "4-Plates" group (T. dunni, T. glomerabilis, T. kittatinniana, T. rufoalba, and T. shubini) and T. skvarlai in having anterio-lateral platelets free from the dorsal plate, dorsal coloration separated into anterior and posterior portions, and indistinct hind coxal margins. T. pollani can be differentiated from T. dunni by having a smaller dorsum (length Q = 535-560 in *T. pollani*, 605-680 in *T. dunni*; $aa{}= 440-490$ in *T. pollani*, 500-540 in *T. dunni*; width \mathcal{Q} , 410–420 in *T. pollani*, 440–490 in *T. dunni*; $\mathcal{J} = 350-370$ in A38, 310–340 in T. pollani); and a more elongate rostrum (length/width = 3.3–3.8 in T. pollani, 2.8-3.1 in T. dunni). T. pollani can be differentiated from T. shubini by having more elongate tibiae (length/width $\mathcal{Q} = 4.00-4.18$ in *T. pollani*, 3.35-3.60 in *T.* shubini; $\mathcal{J} = 3.44-3.75$ in *T. pollani*, 3.11-3.22 in *T. shubini*) and a more elongate rostrum (length/width = 3.27-3.82 in T. pollani, 2.24-2.85 in T. shubini). T. pollani can be differentiated from *T. glomerabilis* by having more elongate anterio-medial platelets (length/width Q = 2.5-3.0 in *T. pollani*, 1.9–2.3 in *T. glomerabilis*; $\mathcal{J} = 2.3-2.5$ in *T. pollani*, 1.9–2.2 in *T. glomerabilis*) and thinner dorsum ($\mathcal{Q} = 410-420$ in *T. pollani*, 460–490 in T. glomerabilis; 👌 = 310–340 in T. pollani, 395–430 in T. glomerabilis).

Figure 193. Torrenticola pollani sp. n. distribution.

T. pollani can be differentiated from *T. kittatinniana* by having a more elongate rostrum (length/width = 3.27-3.82 in *T. pollani*, 2.71-3.16 in *T. kittatinniana*) and more elongate tibiae (length/width \mathcal{Q} = 3.8-4.2 in *T. pollani*, 3.3 in *T. kittatinniana*; \mathcal{O} = 3.44-3.75 in *T. pollani*, 2.80 in *T. kittatinniana*). *T. pollani* can be differentiated from *T. rufoalba* by having a more elongate rostrum (length/width = 3.27-3.82 in *T. pollani*, 2.96-3.06 in *T. rufoalba*). Female *T. pollani* can be differentiated from female *T. rufoalba* by having more elongate tibiae (length/width = 3.8-4.2 in *T. pollani*, 3.5 in *T. rufoalba*). Male *T. pollani* can be differentiated from male *T. rufoalba*). Male *T. pollani* can be differentiated from male *T. rufoalba*). Male *T. pollani* can be differentiated from male *T. rufoalba* by having a longer anterior venter (235-250 in *T. pollani*, 195 in *T. rufoalba*). *T. pollani* can be differentiated from *T. skvarlai* by having a conical pedipalpal femoral tubercle, whereas *T. skvarlai* has a broad and flat pedipalpal femoral tubercle, and by having a longer anterior venter ($\mathcal{Q} = 155-163$ in *T. pollani*, 140-153 in *T. skvarlai*; $\mathcal{O} = 235-250$ in *T. pollani*, 177.5-205 in *T. skvarlai*).

Description. FEMALE (Figure 194) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (535–560 (550) long; 410–420 (415) wide) ovoid with purple to bluish-purple coloration separated into anterior and posterior portions, and occasionally with faint strip of orange medially. Anterio-medial platelets (105–125 (105) long; 40–47.5 (40) wide). Anterio-lateral platelets (152.5–170 (152.5) long; 52.5–62.5 (52.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than

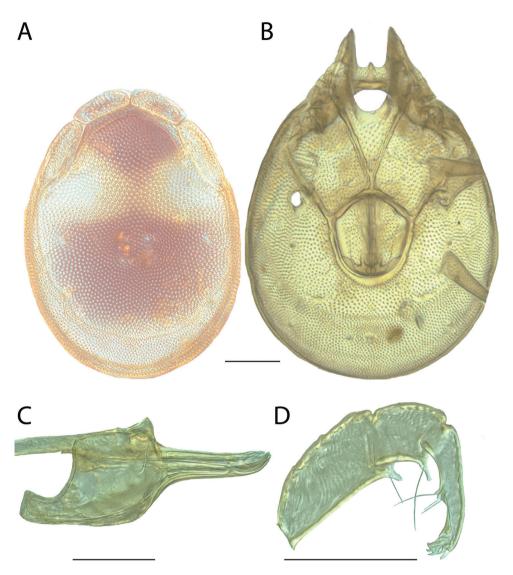

Figure 194. *Torrenticola pollani* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

to the muscle scars (distance between Dgl-4 270–290 (270)). Dorsal plate proportions: dorsum length/width 1.29–1.37 (1.33); dorsal width/distance between Dgl-4 1.45–1.54 (1.54); anterio-medial platelet length/width 2.50–3.03 (2.63); anteriolateral platelet length/width 2.64–2.93 (2.90); anterio-lateral/anterio-medial length 1.34–1.47 (1.45).

Gnathosoma — **Subcapitulum** (310–332.5 (310) long (ventral); 236–257.5 (237) long (dorsal); 122.5–132.5 (122.5) tall) colorless. Rostrum (133.75–150 (133.75) long; 35–41.25 (35) wide). Chelicerae (310–340 (315) long) with curved

fangs (53–60 (56) long). Subcapitular proportions: ventral length/height 2.43–2.61 (2.53); rostrum length/width 3.27–3.82 (3.82). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (40) long); femur (115–127.5 (117.5) long); genu (65–70 (65) long); tibia (80–92.5 (80) long; 20–22.5 (20) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.70–1.92 (1.81); tibia/femur 0.68–0.78 (0.68); tibia length/width 3.89–4.18 (4.00).

Venter — (610–675 (675) long; 461–490 (489) wide) colorless. Gnathosomal bay (142.5–170 (142.5) long; 77.5–97.5 (87.5) wide). Cxgl-4 subapical. **Medial suture** (12.5–20 (17.5) long). **Genital plates** (157.5–175 (157.5) long; 137.5–152.5 (137.5) wide). Additional measurements: Cx-1 (258–290 (259) long (total); 89–121 (96) long (medial)); Cx-3 (304–364 (310) wide); anterior venter (155–162.5 (157.5) long). Ventral proportions: gnathosomal bay length/width 1.63–2.13 (1.63); anterior venter/genital field length 0.89–1.02 (1.00); anterior venter length/genital field width 1.02–1.15 (1.15); anterior venter/medial suture 7.75–12.70 (9.00).

MALE (Figure 195) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (440–490 (450) long; 310–340 (315) wide) ovoid with purple to bluish-purple coloration separated into anterior and posterior portions, and occasionally with faint strip of orange medially. Anterio-medial platelets (92.5–102.5 (100) long; 40–42.5 (42.5) wide). Anterio-lateral platelets (140–155 (142.5) long; 42.5–50 (45) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 210–250 (215)). Dorsal plate proportions: dorsum length/width 1.33–1.44 (1.43); dorsal width/distance between Dgl-4 1.32–1.48 (1.47); anterio-medial platelet length/width 2.31–2.44 (2.35); anterio-lateral platelet length/width 3.10–3.29 (3.17); anterio-lateral/anterio-medial length 1.43–1.59 (1.43).

Gnathosoma — **Subcapitulum** (265–285 (265) long (ventral); 202–208 (203) long (dorsal); 87.5–100 (97.5) tall) colorless. Rostrum (111.25–122.5 (111.25) long; 32.5–35 (32.5) wide). Chelicerae (257–280 (263) long) with curved fangs (45–50 (47) long). Subcapitular proportions: ventral length/height 2.72–3.06 (2.72); rostrum length/width 3.41–3.54 (3.42). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–40 (35) long); femur (100–103.75 (101.25) long); genu (60–62.5 (60) long); tibia (72.5–80 (75) long; 20–22.5 (20) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.64–1.73 (1.69); tibia/femur 0.70–0.78 (0.74); tibia length/width 3.41–3.75 (3.75).

Venter — (540–600 (555) long; 358–408 (359) wide) colorless. Gnathosomal bay (95–127.5 (116.25) long; 65–77.5 (70) wide). Cxgl-4 subapical. **Medial suture** (92.5–110 (93.75) long). **Genital plates** (105–120 (110) long; 80–90 (83.75) wide). Additional measurements: Cx-1 (210–250 (246) long (total); 84–125 (111) long (medial)); Cx-3 (266–300 (266) wide); anterior venter (235–250 (237.5) long). Ventral proportions: gnathosomal bay length/width 1.46–1.89 (1.66); anterior venter/genital field length 2.08–2.29 (2.16); anterior venter length/genital field width 2.78–3.03 (2.84); anterior venter/medial suture 2.27–2.54 (2.53).

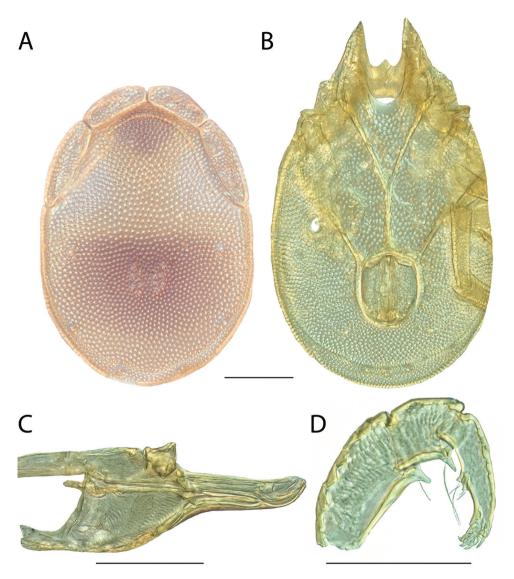

Figure 195. *Torrenticola pollani* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

IMMATURES unknown.

Etymology. Specific epithet (*pollani*) named in honor of author Michael Pollan, whose influential books breach mere accounts on food culture and enter insightful discussions of human ecology.

Distribution. Southeastern (northern Alabama and Georgia) (Figure 193).

Remarks. In all analyses, *Torrenticola pollani* groups with other members of the Rusetria Complex with high support and specimens of this species are less than 1% different in COI sequence from each other. In all analyses, *Torrenticola pollani* groups

with two other species with high support: *T. dunni* and *T. shubini*. These species are greater than 5–10% different from each other in COI sequence. Given our collection efforts in the southern Appalachians, it is reasonable to speculate that *T. pollani* does not overlap in range with either *T. dunni* or *T. shubini*. However, our collections are sparse in the coastal plains and we expect future collecting to expand the distribution southward.

Based upon overall similarity, dorso-lateral platelet fusion, and distribution, we were able to place this species within the Eastern 2-Plate Identification Group

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola priapus Fisher & Dowling, sp. n. http://zoobank.org/262CE779-DB0C-4533-9AE3-CC430B47801A

Material examined. HOLOTYPE (\bigcirc): from USA, Texas, Tyler County, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A

PARATYPES (5 \bigcirc ; 5 \circlearrowright): **New Hampshire, USA**: 4 \bigcirc and 1 \circlearrowright from Woodstock County, beside Rt. 118, 3.2 km south of Rt. 112, (44°0'0"N, 71°45'45"W), 11 September 1992, by IM Smith, IMS920036 • **Texas, USA**: 1 \circlearrowright (ALLOTYPE) from Tyler County, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A • 1 \bigcirc and 3 \circlearrowright from Tyler County, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A • 1 \bigcirc and 3 \circlearrowright from Tyler County, Spurger; beside Farm Road 1013, 8.2 km west of Rt. 92, (30°41'41"N, 94°15'15"W), 30 September 1994, by IM Smith, IMS940027A

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and some paratypes (3 \bigcirc ; 2 \circlearrowright) deposited in the CNC; other paratypes (2 \bigcirc ; 2 \circlearrowright) deposited in the ACUA.

Diagnosis. Torrenticola priapus are similar to other members of the Partial 2-Plate Group (*T. folkertsae, T. magnexa*, and *T. pulchra*) in having anterio-lateral platelets partially fused to the dorsal plate and being distributed in the east. *T. priapus* can be differentiated from *T. magnexa* and *T. pulchra* by dorsal coloration and pattern. *T. priapus* can be further differentiated from *T. magnexa* by having a more elongate rostrum (length/width = 3.17–3.39 in *T. priapus*, 2.25–3.00 in *T. magnexa*). *T. priapus* can be further differentiated from *T. pulchra* by having a round dorsum (length/width = 1.18– 1.22 in *T. priapus*, 1.4–1.61 in *T. pulchra*) and more elongate pedipalpal tibiae (length/ width Q = 3.9-4.22 in *T. priapus*, 3.3–3.70 in *T. pulchra*, $\mathcal{F} = 3.5-3.78$ in *T. priapus*, 3.00–3.35 in *T. pulchra*). *T. priapus* can be differentiated from *T. folkertsae* by having less elongate pedipalpal tibiae (length/width Q = 3.9-4.22 in *T. priapus*, 4.5–4.83 in *T. folkertsae*, $\mathcal{F} = 3.5-3.78$ in *T. priapus*, 4.05–4.33 in *T. folkertsae*) and a more elongate rostrum (length/width = 3.17–3.39 in *T. priapus*, 2.55–3.00 in *T. folkertsae*).

Description. FEMALE (Figure 197) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Figure 196. Torrenticola priapus sp. n. distribution.

Dorsum — (610–690 (650) long; 510–580 (540) wide) circular with purple coloration posteriorly and anteriorly connected medially but not extending to platelets. Anterio-medial platelets (150–170 (162.5) long; 62.5–70 (65) wide). Anterio-lateral platelets (175–190 (185) long; 75–95 (95) wide) partially fused to dorsal plate. Dgl-4 nearly halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 305–370 (345)). Dorsal plate proportions: dorsum length/width 1.19–1.21 (1.20); dorsal width/distance between Dgl-4 1.56–1.67 (1.57); anterio-medial platelet length/width 2.37–2.50 (2.50); anterio-lateral platelet length/width 1.95–2.33 (1.95); anterio-lateral/anterio-medial length 1.12–1.23 (1.14).

Gnathosoma — **Subcapitulum** (325–355 (355) long (ventral); 245–270 (270) long (dorsal); 137.5–155 (150) tall) colorless. Rostrum (142.5–152.5 (152.5) long; 45–45 (45) wide). Chelicerae (330–370 (360) long) with curved fangs (55–65 (65) long). Subcapitular proportions: ventral length/height 2.28–2.37 (2.37); rostrum length/width 3.17–3.39 (3.39). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–50 (48.75) long); femur (118.75–135 (135) long); genu (70–80 (76.25) long); tibia (92.5–105 (97.5) long; 22.5–25 (25) wide); tarsus (17.5–22.5 (22.5) long). Palpomere proportions: femur/genu 1.69–1.77 (1.77); tibia/femur 0.72–0.84 (0.72); tibia length/width 3.90–4.22 (3.90).

Venter — (720–850 (770) long; 590–645 (605) wide) colorless. Gnathosomal bay (160–192.5 (192.5) long; 77.5–90 (80) wide). Cxgl-4 subapical. **Medial suture** (15–15 (15) long). **Genital plates** (180–190 (190) long; 167.5–185 (185) wide). Ad-

ditional measurements: Cx-1 (280–320 (315) long (total); 115–135 (130) long (medial)); Cx-3 (355–390 (390) wide); anterior venter (150–165 (160) long). Ventral proportions: gnathosomal bay length/width 2.00–2.41 (2.41); anterior venter/genital field length 0.81–0.89 (0.84); anterior venter length/genital field width 0.86–0.97 (0.86); anterior venter/medial suture 10.00–11.00 (10.67).

MALE (Figure 198) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

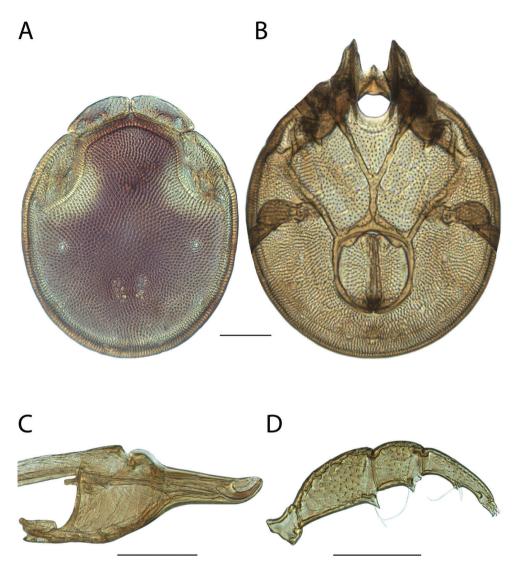

Figure 198. *Torrenticola priapus* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Dorsum — (530–585 (530) long; 435–495 (435) wide) circular with purple coloration posteriorly and anteriorly connected medially but not extending to platelets. Anterio-medial platelets (131.25–145 (131.25) long; 52.5–62.5 (55) wide). Anterio-lateral platelets (165–182.5 (170) long; 70–77.5 (70) wide) partially fused to dorsal plate. Dgl-4 nearly halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 265–330 (265)). Dorsal plate proportions: dorsum length/width 1.18–1.22 (1.22); dorsal width/distance between Dgl-4 1.50–1.70 (1.64); anterio-

medial platelet length/width 2.32–2.76 (2.39); anterio-lateral platelet length/width 2.13–2.43 (2.43); anterio-lateral/anterio-medial length 1.14–1.30 (1.30).

Gnathosoma — **Subcapitulum** (305–320 (305) long (ventral); 230–245 (235) long (dorsal); 125–130 (125) tall) colorless. Rostrum (127.5–140 (127.5) long; 40–42.5 (40) wide). Chelicerae (305–320 (305) long) with curved fangs (57.5–60 (60) long). Subcapitular proportions: ventral length/height 2.44–2.48 (2.44); rostrum length/width 3.19–3.29 (3.19). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–45 (42.5) long); femur (110–117.5 (110) long); genu (67.5–72.5 (67.5) long); tibia (85–93.75 (85) long; 22.5–25 (22.5) wide); tarsus (20–22.5 (20) long). Palpomere proportions: femur/genu 1.62–1.70 (1.63); tibia/femur 0.76–0.80 (0.77); tibia length/width 3.50–3.78 (3.78).

Venter — (625–695 (625) long; 510–560 (540) wide) colorless. Gnathosomal bay (145–157.5 (145) long; 70–77.5 (70) wide). Cxgl-4 subapical. **Medial suture** (75–80 (75) long). **Genital plates** (165–185 (165) long; 145–160 (150) wide). Additional measurements: Cx-1 (270–305 (285) long (total); 120–140 (140) long (medial)); Cx-3 (340–360 (350) wide); anterior venter (220–250 (230) long). Ventral proportions: gnathosomal bay length/width 2.00–2.25 (2.07); anterior venter/genital field length 1.33–1.42 (1.39); anterior venter length/genital field width 1.47–1.61 (1.53); anterior venter/medial suture 2.93–3.13 (3.07).

IMMATURES unknown.

Etymology. Specific epithet (*priapus*) is named for Priapus, the Greek fertility god who was marked by his oversized, permanent erection, which refers to the genital opening in the male—the largest of all North American *Torrenticola*.

Distribution. Eastern (Figure 196). Distribution seemingly disjunct (Texas and New Hampshire).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola priapus* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution, and partial fusion of the dorso-lateral platelets to the dorsal plate, are consistent with placing this species in the Rusetria Complex and within the Partial 2-Plate Identification Group.

Type deposition. Types $(1 \ \bigcirc; 1 \ \Diamond)$ deposited in the CNC.

Diagnosis. Torrenticola projector are unlike nearly all other Torrenticola in having such elongate bodies and subcapitula. T. elongata are also elongate, but have different dorsal coloration and do not have an elongate subcapitulum. T. tahoei also have elongate subcapitula, but have rounder bodies with different dorsal coloration. T. anoplopalpa also have elongate subcapitula, but have rounder bodies and incomplete hind coxae.

Re-description. FEMALE (Figure 200) (n = 5) with characters of the genus with following specifications.

Dorsum — (625–745 long; 400–470 wide) ovoid and elongate with pink coloration without distinct pattern. Anterio-medial platelets (95–115 long; 55–62.5 wide). Anterio-lateral platelets (185–217.5 long; 50–57.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–370). Dorsal plate proportions: dorsum length/width 1.52–1.68; dorsal width/ distance between Dgl-4 1.24–1.28; anterio-medial platelet length/width 1.73–2.05; anterio-lateral platelet length/width 3.36–3.90; anterio-lateral/anterio-medial length 1.76–1.95.

Gnathosoma — **Subcapitulum** (382.5–445 long (ventral); 300–333 long (dorsal); 87.5–97.5 tall) colorless and elongate. Rostrum (142.5–172.5 long; 37.5–42.5 wide) elongate. Chelicerae (360–428 long) with curved fangs (51–62 long). Subcapitular proportions: ventral length/height 4.03–4.78; rostrum length/width 3.80–4.27. **Pedipalps** short and stocky (especially tibiae) without extensions on femora and genua. Palpomeres: trochanter (47.5–55 long); femur (108.75–125 long); genu (60–70 long); tibia (21.25–25 long; 21.25–25 wide); tarsus (20–22.5 long). Palpomere proportions: femur/genu 1.74–1.81; tibia/femur 0.55–0.60; tibia length/width 2.82–3.11.

Venter — (830–931 long; 480–544 wide) colorless. Gnathosomal bay (92.5–110 long; 67.5–80 wide). Cxgl-4 far from apex. **Medial suture** (50–77.5 long). **Geni-tal plates** 183.75–188.75 long; 147.5–160 wide). Additional measurements: Cx-1 (296.75–357 long (total); 215–250 long (medial)); Cx-3 (310–374 wide); anterior venter (285–340 long). Ventral proportions: gnathosomal bay length/width 1.22–1.63; anterior venter/genital field length 1.55–1.84; anterior venter length/genital field width 1.78–2.16; anterior venter/medial suture 4.39–6.05.

MALE (Figure 201) (n = 6) with characters of the genus with following specifications.

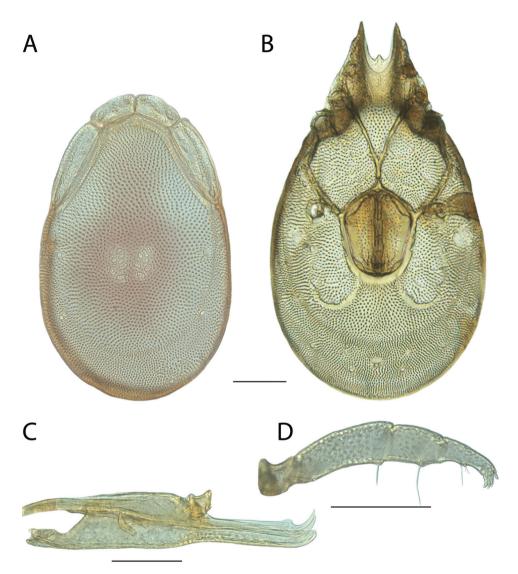

Figure 200. *Torrenticola projector* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Dorsum — (540–630 (600) long; 335–400 wide) ovoid and elongate with pink coloration without distinct pattern. Anterio-medial platelets (90–112.5 long; 47.5–57.5 wide). Anterio-lateral platelets (170–205 long; 47.5–57.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 265–335). Dorsal plate proportions: dorsum length/width 1.54–1.61); dorsal width/distance between Dgl-4 1.16–1.26; anterio-medial platelet length/width 1.70–2.20; anterio-lateral platelet length/width 3.23–3.68; anterio-lateral/anterio-medial length 1.61–2.00.

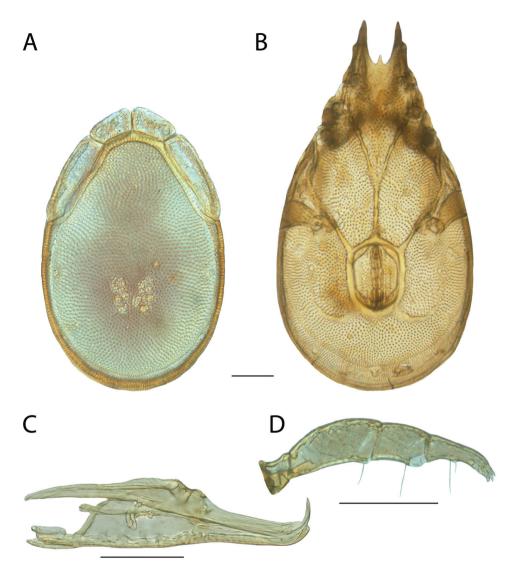

Figure 201. *Torrenticola projector* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D**pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Gnathosoma — **Subcapitulum** (325–420 long (ventral); 245–334 long (dorsal); 78.75–90 tall) colorless and elongate. Rostrum (127.5–158.75 long; 31.25–35 wide) elongate. Chelicerae (297–382 long) with curved fangs (41–61 long). Subcapitular proportions: ventral length/height 3.94–4.94; rostrum length/width 3.64–4.54. **Pedipalps** short and stocky (especially tibiae) without extensions on femora and genua. Palpomeres: trochanter (45–50 long); femur (100–113.75 long); genu (62.5–67.5 long); tibia (62.5–67.5 long; 22.5–22.5 wide); tarsus (17.5–20 long). Palpomere proportions: femur/genu 1.58–1.75; tibia/femur 0.59–0.64; tibia length/width 2.78–3.00.

Venter — (680–860 long; 405–492 wide) colorless. Gnathosomal bay (82.5–132.5 long; 60–75 wide). Cxgl-4 far from apex. **Medial suture** (127.5–142.5 long). **Genital plates** (137.5–157.5 long; 100–111.25 wide). Additional measurements: Cx-1 (252–392 long (total); 175–267 long (medial)); Cx-3 (282–355 wide); anterior venter (320–410 long). Ventral proportions: gnathosomal bay length/width 1.38–2.04; anterior venter/genital field length 2.27–2.64; anterior venter length/genital field width 3.20–3.71; anterior venter/medial suture 2.39–3.15.

IMMATURES unknown.

Etymology. Habeeb (1961) did not specify an etymology for the specific epithet (*projector*). However, surely this name reflects the elongated, projectable gnathosoma (*proiectus*, L. stick out)

Distribution. Appalachians (Figure 199). *T. projector* was previously known only from New York; we extend its range throughout the Appalachians.

Remarks. Torrenticola projector groups with other members of the Tricolor Complex in all analyses with high support and specimens are less than 1% different in COI sequence from each other. In the combined analysis, *T. projector* groups with two other species (*T. hoosieri* and *T. pearsoni*) with high support and these species are greater than 4% different from each other. Whereas most eastern members of the Tricolor Complex have distinctive patterns, this clade of three species contains members that lack dark patterns. *T. projector* is among the most distinctive of all *Torrenticola* because of the highly elongated gnathosoma and body. Because of this distinctive morphology, we do not place this species into an identification group.

This species hypothesis is supported by low COI divergence within the species (0-2%), high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Torrenticola pulchra Fisher & Dowling, sp. n. http://zoobank.org/6DFF72DC-131D-4C43-AE70-B25E8888FD41

Material examined. HOLOTYPE (\mathcal{Q}): from, USA, Illinois, Pope County, Eddyville; Bell Smith Springs Recreation Area; just below low water bridge at Hunting Branch Picnic Area, (37°31'31"N, 88°39'39"W), 1 September 2006, by IM Smith, S Yi, IMS060057.

PARATYPES (4 \bigcirc ; 5 \bigcirc): **Illinois, USA**: 1 \bigcirc (ALLOTYPE) from Pope County, Eddyville; Bell Smith Springs Recreation Area; just below low water bridge at Hunting Branch Picnic Area, (37°31'31"N, 88°39'39"W), 1 September 2006, by IM Smith, S Yi, IMS060057 • 3 \bigcirc and 3 \bigcirc from Pope County, Eddyville; Bell Smith Springs Recreation Area; just below low water bridge at Hunting Branch Picnic Area, (37°31'31"N, 88°39'39"W), 1 September 2006, by IM Smith, S Yi, IMS060057 • 1 \bigcirc and 1 \bigcirc from Pope County, Eddyville; Bell Smith Picnic Area, (37°31'31"N, 88°39'39"W), 1 September 2006, by IM Smith, S Yi, IMS060057 • 1 \bigcirc and 1 \bigcirc from Pope County, Eddyville; Bell Smith Picnic Area, (37°31'31"N, 88°40'40"W), 9 September 1994, by IM Smith, IMS940004

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(2 \bigcirc; 2 \circlearrowright)$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \circlearrowright)$ deposited in the ACUA.

Figure 202. Torrenticola pulchra sp. n. distribution.

Diagnosis. *Torrenticola pulchra* are similar to other members of the Partial 2-Plate Group (*T. folkertsae, T. magnexa*, and *T. priapus*) in having anterio-lateral platelets partially fused to the dorsal plate and being distributed in the east. *T. pulchra* can be differentiated from other Partial 2-Plate Group by dorsal coloration and pattern. *T. pulchra* can be further differentiated from *T. priapus* and *T. folkertsae* by having a more ovoid dorsum (length/width = 1.4–1.61 in *T. pulchra*, 1.11–1.29 in others) and less elongate pedipalpal tibiae (length/width Q = 3.3-3.70 in *T. pulchra*, 3.9–4.83 in others, $\delta =$ 3.00-3.35 in *T. pulchra*, 3.5-4.33 in others). Male *T. pulchra* can be further differentiated from male *T. magnexa* by having a smaller genital field (length $\delta = 110-123$ in *T. pulchra*, 125–148 in *T. magnexa*; width $\delta = 87-95$ in *T. pulchra*, 115–125 in *T. magnexa*,) and less elongate pedipalpal tibiae (length/width $\delta = 3.00-3.35$ in *T. pulchra*, 3.78-4.00 in *T. magnexa*,). Female *T. pulchra* can be differentiated from female *T. magnexa*, and shorter pedipalpal tibiae (Q = 147-160 in *T. pulchra*, 170–188 in *T. magnexa*) and shorter pedipalpal tibiae (Q = 82-93 in *T. pulchra*, 102–113 in *T. magnexa*).

Description. FEMALE (Figure 203) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (640–710 (710) long; 450–490 (480) wide) ovoid with bold blue coloration separated into anterior and posterior portions, posterior portion not meeting posterior limit of dorsal plate, and bold red medially. Anterio-medial platelets (130–145 (135) long; 50–55 (55) wide). Anterio-lateral platelets (177.5–200 (190) long; 60–70 (60) wide) nearly fused to dorsal plate posteriorly. Dgl-4 closer to the edge of

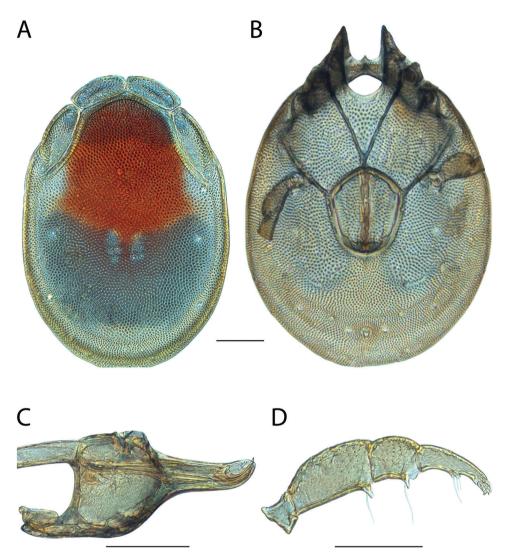

Figure 203. *Torrenticola pulchra* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

the dorsum than to the muscle scars (distance between Dgl-4 320–375 (355)). Dorsal plate proportions: dorsum length/width 1.40–1.48 (1.48); dorsal width/distance between Dgl-4 1.30–1.45 (1.35); anterio-medial platelet length/width 2.45–2.90 (2.45); anterio-lateral platelet length/width 2.77–3.17 (3.17); anterio-lateral/anterio-medial length 1.33–1.41 (1.41).

Gnathosoma — **Subcapitulum** (295–345 (345) long (ventral); 215–252.5 (252.5) long (dorsal); 130–155 (155) tall) faint blue coloration. Rostrum (117.5–135 (135) long; 40–45 (45) wide). Chelicerae (295–350 (350) long) with curved fangs (60–70 (70) long). Subcapitular proportions: ventral length/height 2.03–2.33 (2.23);

rostrum length/width 2.94–3.06 (3.00). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5–52.5 (52.5) long); femur (118.75–132.5 (130) long); genu (67.5–75 (72.5) long); tibia (82.5–92.5 (90) long; 25–26.25 (25) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.73–1.80 (1.79); tibia/femur 0.69–0.72 (0.69); tibia length/width 3.30–3.70 (3.60).

Venter — (740–840 (840) long; 530–560 (560) wide) with blue coloration. Gnathosomal bay (155–190 (190) long; 75–90 (75) wide). Cxgl-4 subapical. **Medial suture** (10–20 (10) long). **Genital plates** (180–200 (192.5) long; 147.5–160 (155) wide). Additional measurements: Cx-1 (280–350 (350) long (total); 130–162.5 (162.5) long (medial)); Cx-3 (325–365 (360) wide); anterior venter (160–175 (175) long). Ventral proportions: gnathosomal bay length/width 1.94–2.53 (2.53); anterior venter/genital field length 0.80–0.96 (0.91); anterior venter length/genital field width 1.00–1.13 (1.13); anterior venter/medial suture 8.00–17.50 (17.50).

MALE (Figure 204) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (490–520 (500) long; 310–330 (315) wide ovoid with bold blue coloration separated into anterior and posterior portions, posterior portion not meeting posterior limit of dorsal plate, and bold red medially. Anterio-medial platelets (95–110 (100) long; 40–47.5 (42.5) wide). Anterio-lateral platelets (140–160 (145) long; 45–55 (50) wide) nearly fused to dorsal plate posteriorly. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 235–265 (245)). Dorsal plate proportions: dorsum length/width 1.53–1.61 (1.59); dorsal width/distance between Dgl-4 1.23–1.36 (1.29); anterio-medial platelet length/width 2.24–2.50 (2.35); anterio-lateral platelet length/width 2.80–3.56 (2.90); anterio-lateral/anterio-medial length 1.45–1.55 (1.45).

Gnathosoma — **Subcapitulum** (255–262.5 (255) long (ventral); 182.5–195 (182.5) long (dorsal); 90–95 (90) tall) faint blue coloration. Rostrum (97.5–105 (97.5) long; 30–32.5 (30) wide). Chelicerae (240–255 (245) long) with curved fangs (45–50 (45) long). Subcapitular proportions: ventral length/height 2.68–2.83 (2.83); rostrum length/width 3.23–3.50 (3.25). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (37.5) long); femur (97.5–100 (100) long); genu (55–57.5 (57.5) long); tibia (67.5–72.5 (70) long; 21.25–22.5 (22.5) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.70–1.82 (1.74); tibia/femur 0.69–0.73 (0.70); tibia length/width 3.00–3.35 (3.11).

Venter — (600–625 (600) long; 355–390 (355) wide) with blue coloration. Gnathosomal bay (120–130 (120) long; 60–67.5 (67.5) wide). Cxgl-4 subapical. **Medial suture** (105–130 (125) long). **Genital plates** (110–122.5 (115) long; 87.5–95 (92.5) wide). Additional measurements: Cx-1 (240–255 (240) long (total); 122.5–130 (125) long (medial)); Cx-3 (275–295 (280) wide); anterior venter (235–270 (255) long). Ventral proportions: gnathosomal bay length/width 1.78–2.08 (1.78); anterior venter/ genital field length 2.00–2.32 (2.22); anterior venter length/genital field width 2.61– 2.91 (2.76); anterior venter/medial suture 2.04–2.24 (2.04).

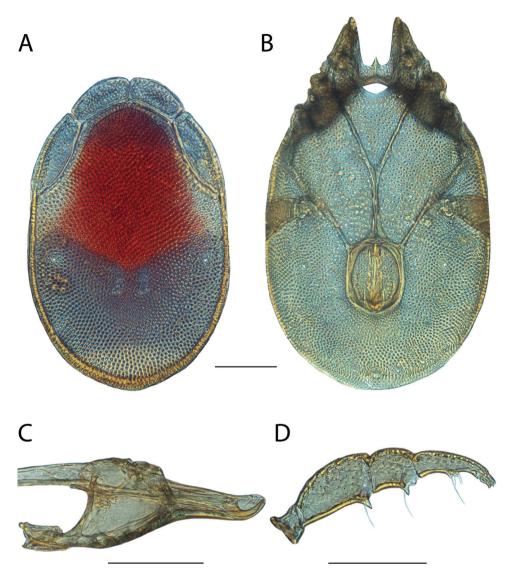

Figure 204. *Torrenticola pulchra* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

IMMATURES unknown.

Etymology. Specific epithet (*pulchra*) refers to the bright and distinctive coloration of this species (*pulchra*, L. beautiful).

Distribution. Southern Illinois (Figure 202).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola pulchra* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution, and partial fusion of the dorso-lateral platelets to the dorsal plate, are consistent with placing this species in the Rusetria Complex and within the Partial 2-Plate Identification Group.

Torrenticola racupalpa Fisher & Dowling, sp. n. http://zoobank.org/A920D498-57BC-4F1D-9A01-6EF24095B853

Material examined. HOLOTYPE (\bigcirc): from USA, Tennessee, Wayne County, Glenrock Branch Creek (35°15'50"N, 87°37'34"W), 24 Sep 2009, by IM Smith, IMS090124, DNA 1867.

PARATYPES (4 \bigcirc ; 2 \eth): **Virginia, USA:** 4 \bigcirc and 2 \circlearrowright (ALLOTYPE) from Smyth County, Mount Rogers National Recreation Area, Little Laurel Creek, beside Route 600, 2.2 kilometers north of Route 603, 10 Jul 1990, by IM Smith, IMS900086.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and most paratypes $(3 \bigcirc)$ deposited in the CNC; other paratypes $(1 \bigcirc; 1 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola racupalpa are similar to other members of the Raptor Group (T. gnoma, T. irapalpa, T. longitibia, T. mjolniri, T. elusiva, T. raptor, T. danielleae, T. daemon, and T. ivyae) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. Female T. racupalpa can be differentiated from T. elusiva by having a more elongate subcapitulum (ventral length/height = 2.48–2.73 in *T. racupalpa*, 2.39 in *T. elusiva*); and by dorsal pattern. *T.* racupalpa can be differentiated from T. irapalpa and T. daemon by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.19-2.77 in *T. racupalpa*, 1.45-2.09 in others) and a more elongate rostrum (length/width = 3.56-3.88 in T. racupalpa, 2.66–3.39 in others). T. racupalpa can be differentiated from T. gnoma by having a more elongate rostrum (length/width = 3.56–3.88 in *T. racupalpa*, 2.56–3.13 in T. gnoma) and dorsal coloration and pattern. T. racupalpa can be differentiated from T. mjolniri by having a shorter anterior venter ($\mathcal{Q} = 152.5 - 165$ in T. racupalpa, 180–195 in *T. mjolniri*; $\mathcal{J} = 200-205$ in *T. racupalpa*, 230–255 in *T. mjolniri*); and by dorsal pattern. Male T. racupalpa can be differentiated from T. longitibia (males only) by having a shorter femur with respect to the genu (femur/genu = 1.92-1.92 in T. racupalpa, 2.10-2.17 in T. longitibia); a stockier rostrum (length/width = 3.88-3.88 in T. racupalpa, 4.15–4.23 in T. longitibia); and dorsal pattern. T. racupalpa can be differentiated from *T. raptor* by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.19–2.77 in T. racupalpa, 1.68–2.02 in T. raptor); and shorter anterior venter ($\bigcirc = 152.5 - 165$ in *T. racupalpa*, 205–240 in *T. raptor*, $\bigcirc = 200 - 205$ in T. racupalpa, 245-305 in T. raptor). Female T. racupalpa can be differentiated from female T. raptor by having stockier pedipalp tibiae (length/width = 4.44-5.00 in T. racupalpa, 6–7.54 in T. raptor). T. racupalpa can be differentiated from T. danielleae by having Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 2.19-2.77 in *T. racupalpa*, 1.42–1.70 in *T. danielleae*) and by dorsal coloration and pattern. Female T. racupalpa can be differentiated from female T. ivyae by having a less elongate

Figure 205. Torrenticola racupalpa sp. n. distribution.

rostrum (length/width = 3.56-3.82 in *T. racupalpa*, 4.00-4.15 in *T. ivyae*) and less elongate pedipalpal tibiae (length/width = 4.44-5.00 in *T. racupalpa*, 5.07-5.64 in *T. ivyae*). Male *T. racupalpa* can be differentiated from male *T. ivyae* by having a shorter anterior venter (3200-205 in *T. racupalpa*, 220-230 in *T. ivyae*) and a longer genital field (3160-165 in *T. racupalpa*, 142-148 in *T. ivyae*).

Type deposition. Holotype (\bigcirc) deposited in the CNC.

Description. FEMALE (Figure 206) (n = 3) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (570–630 (570) long; 450–540 (450) wide) ovoid with bluish-purple coloration separated into anterior and posterior portions with bold orange medially. Anterio-medial platelets (130–145 (130) long; 52.5–65 (52.5) wide). Anterio-lateral platelets (157.5–200 (157.5) long; 71.25–75 (71.25) wide) free from dorsal plate. Dgl-4 much closer to the muscle scars than to dorsum edge (distance between Dgl-4 170–205 (170)). Dorsal plate proportions: dorsum length/width 1.17–1.27 (1.27); dorsal width/distance between Dgl-4 2.59–2.77 (2.65); anterio-medial platelet length/ width 2.19–2.48 (2.48); anterio-lateral platelet length/width 2.21–2.67 (2.21); anterio-lateral platelateral length 1.21–1.40 (1.21).

Gnathosoma — Subcapitulum (330–375 (330) long (ventral); 251–297.5 (252) long (dorsal); 130–145 (130) tall) faint bluish-purple coloration. Rostrum (142.5–170 (142.5) long; 40–45 (40) wide) elongate. Chelicerae (319–375 (320) long) with curved fangs (50–60 (50) long). Subcapitular proportions: ventral length/height 2.48–

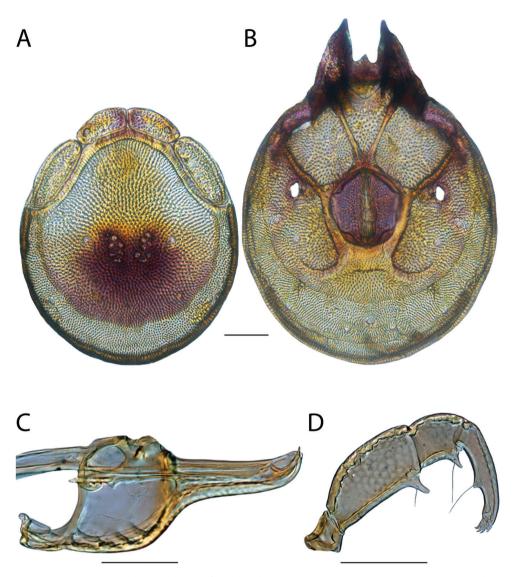

Figure 206. *Torrenticola racupalpa* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

2.73 (2.54); rostrum length/width 3.56–3.82 (3.56). **Pedipalps** elongate (especially tibia) with long tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–45 (45) long); femur (125–145 (125) long); genu (67.5–75 (67.5) long); tibia (100–125 (100) long; 22.5–25 (22.5) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.85–1.93 (1.85); tibia/femur 0.80–0.86 (0.80); tibia length/width 4.44–5.00 (4.44).

Venter — (700–800 (700) long; 490–610 (491) wide) with bold bluish-purple coloration. Gnathosomal bay (152.5–185 (152.5) long; 80–87.5 (87.5) wide). Cxgl-4 sub-

apical. **Medial suture** (17.5–20 (17.5) long). **Genital plates** (152.5–185 (152.5) long; 140–170 (140) wide). Additional measurements: Cx-1 (285–320 (286) long (total); 114–140 (115) long (medial)); Cx-3 (332–380 (332) wide); anterior venter (152.5–165 (152.5) long). Ventral proportions: gnathosomal bay length/width 1.74–2.31 (1.74); anterior venter/genital field length 0.89–1.00 (1.00); anterior venter length/genital field width 0.97–1.09 (1.09); anterior venter/medial suture 8.00–8.71 (8.71).

MALE (Figure 207) (n = 2) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (555–570 (570) long; 460–475 (475) wide) ovoid with bluish-purple coloration separated into anterior and posterior portions with bold orange medially. Anterio-medial platelets (130–135 (135) long; 57.5–65 (65) wide). Anterio-lateral platelets (182.5–190 (190) long; 70–80 (80) wide) free from dorsal plate. Dgl-4 much closer to the muscle scars than to dorsum edge (distance between Dgl-4 200–210 (200)). Dorsal plate proportions: dorsum length/width 1.20–1.21 (1.20); dorsal width/distance between Dgl-4 2.19–2.38 (2.38); anterio-medial platelet length/width 2.08–2.26 (2.08); anterio-lateral platelet length/width 2.38–2.61 (2.38); anterio-lateral real/anterio-medial length 1.40–1.41 (1.41).

Gnathosoma — **Subcapitulum** (315–317.5 (317.5) long (ventral); 250–250 (250) long (dorsal); 110–115 (115) tall) faint bluish-purple coloration. Rostrum (155–155 (155) long; 40–40 (40) wide) elongate. Chelicerae (295–310 (310) long) with curved fangs (50–55 (50) long). Subcapitular proportions: ventral length/height 2.76–2.86 (2.76); rostrum length/width 3.88–3.88 (3.88). Pedipalps elongate (especially tibia) with long tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–40 (40) long); femur (125–125 (125) long); genu (65–65 (65) long); tibia (107.5–110 (107.5) long; 20–20 (20) wide); tarsus (15–15 (15) long). Palpomere proportions: femur/genu 1.92–1.92 (1.92); tibia/femur 0.86–0.88 (0.86); tibia length/ width 5.38–5.50 (5.38).

Venter — (695–710 (710) long; 500–505 (500) wide) with bold bluish-purple coloration. Gnathosomal bay (157.5–160 (157.5) long; 70–70 (70) wide). Cxgl-4 subapical. **Medial suture** (45–45 (45) long). **Genital plates** (160–165 (165) long; 125–125 (125) wide). Additional measurements: Cx-1 (300–305 (300) long (to-tal); 145–145 (145) long (medial)); Cx-3 (340–345 (340) wide); anterior venter (200–205 (205) long). Ventral proportions: gnathosomal bay length/width 2.25–2.29 (2.25); anterior venter/genital field length 1.24–1.25 (1.24); anterior venter length/genital field width 1.60–1.64 (1.64); anterior venter/medial suture 4.44–4.56 (4.56).

IMMATURES unknown.

Etymology. Specific epithet (*racupalpa*) refers to the spined, rake-like pedipalps which have long, thin tibiae and elongate tubercles (*racu*, Old English feminine, rake; *palpus*, L. hand, feeler).

Distribution. Southeastern, Tennessee and Virginia (Figure 205).

Remarks. In the COI analysis, *Torrenticola racupalpa* groups with other members of the Raptor Complex with high support. We were only able to acquire molecular data from one specimen, and we were unable to amplify 28S, which disabled us from examining the placement of this species in our combined analysis. In the COI analysis, *T. racupalpa* groups with *T. elusiva* with high confidence, and these species are greater than 4% different in COI sequence from each other. Based upon this information as well as morphology, we place this species in Raptor Identification Group.

This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Torrenticola rala Cook, 1980

Torrenticola rala Cook, 1980: 394.

Material examined (11 ; 15). Arizona, USA: 3 from Coconino County, Oak Creek Canyon, Oak Creek, beside Route 89A, between Banjo Bill & Bootlegger campgrounds, 21 Jul 1987, by IM Smith, IMS870100A • 1 👌 and 1 👌 from Cochise County, Chiricahua Mountains, Cave Creek Recreation Area, Cave Creek at John Hand Picnic Area, 15 Jul 1987, by IM Smith, IMS870092B • 1 2 from Cochise County, Chiricahua Mountains, Cave Creek Recreation Area, Cave Creek at Stewart campground, 16 Jul 1987, by IM Smith, IMS870094 • 1 9 from Cochise County, Chiricahua Mountains, Cave Creek, Herb Martyr Campground, Forest Road 42A 10 May 2012, by IM Smith, IMS120009 • 3 \bigcirc and 1 \bigcirc from Gila County, East Verde River, beside Route 87, north of Payson, 19 Jul 1987, by IM Smith, IMS870097 • 2 🖧 from Yavapai County, West Clear Creek at Clear Creek campground, off Forest Road 9, east of Camp Verde, 19-22 Jul 1987, by IM Smith, IMS870098 • New Mexico, USA: • 1 Å from Catron County, Glenwood Whitewater Creek at Whitewater Creek Picnic Area, 12 Jul 1987, by IM Smith, IMS870084 • 2 2 and 4 3 from Catron County, Little Creek, beside Route 15, 65 kilometers north of Route 180 in Silver City, 10 Jul 1987, by IM Smith, IMS870081A • Texas, USA: 1 2 and 1 3 from Bandera County, Lost Maples State Natural Area, Sabinal River (29°49'N, 99°34'W), 27 Sep 1995, by IM Smith, IMS950052 • 1 ♀ from Bandera County, Vanderpool, beside Route 187, Sabinal River (29°48'10"N, 99°34'30"W), 2 May 2009, by IM Smith, IMS090007 • 1 \bigcirc and 1 \bigcirc from Val Verde County, Bakers Crossing Campground, off Route 163, Devils River (29°58'N, 101°9'W), 5 Oct 1999, by IM Smith, IMS990061A • 1 ♀ from Uvalde County, Garner State Park, Frio River (29°35'22"N, 99°44'12"W), 28 May 1998, by IM Smith, IMS980027A.

Type deposition. Holotype (\mathcal{J}) deposited in prep. no. DC 12–72 FMC. Allotype (\mathcal{Q}) deposited in prep. no. DC 43–72 FMC.

Diagnosis. Torrenticola rala are similar to other members of the Rala Group (*T. boettgeri, T. keesdavidsi, T. kurtvietsi, T. lamellipalpis, T. dolichodactyla,* and *T. anoplopalpa*) by being colorless, having incomplete hind coxal margins and being distributed in the southwest. *T. rala* can be differentiated from all other Rala Group by having a stockier rostrum (length/width = 1.63–1.83 in *T. rala,* 2.19–3.57 in others). Additionally, *T. rala* can be differentiated from all other Rala Group by having a shorter anterior venter (Q = 170-185 in *T. rala* 192–260 in others $\stackrel{\frown}{\circ} = 200-225$ in *T. rala,* 2.35–308 in others), except male *T. keesdavidsi* ($\stackrel{\frown}{\circ} 225-260$).

Re-description. FEMALE (Figure 209) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (630–700 long; 465–505 wide) ellipsoid and colorless. Anterio-medial platelets (150–162.5 long; 62.5–72.5 wide). Anterio-lateral platelets (172.5–195 long; 70–80 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 370–420). Dorsal plate proportions:

Figure 208. *Torrenticola rala* distribution. Red dots represent material examined; blue diamonds represent previous records (Cook 1980); blue star represents holotype locality (Cook 1980).

dorsum length/width 1.30–1.46; dorsal width/distance between Dgl-4 1.17–1.26; anterio-medial platelet length/width 2.14–2.41; anterio-lateral platelet length/width 2.38–2.79; anterio-lateral/anterio-medial length 1.15–1.26.

Gnathosoma — **Subcapitulum** (247.5–260 long (ventral); 160–170 long (dorsal); 115–120 tall) tall and colorless. Rostrum (79–89 long; 45–50 wide) short and conical. Chelicerae (217.5–247.5 long) with curved fangs (52.5–60 long). Subcapitular proportions: ventral length/height 2.06–2.17; rostrum length/width 1.70–1.83. **Pedipalps** short and stocky (especially tibiae) with tuberculate ventral extensions on femora and ventral extensions on genua absent. Palpomeres: trochanter (35–37.5 long); femur (70–77.5 long); genu (50–57.5 long); tibia (55–62.5 long; 20–22.5

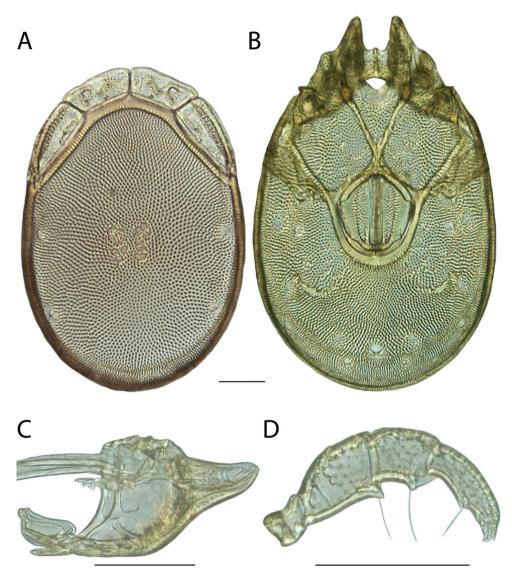

Figure 209. *Torrenticola rala* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

wide); tarsus (15–17.5 long). Palpomere proportions: femur/genu 1.35–1.43; tibia/ femur 0.79–0.81; tibia length/width 2.75–2.88.

Venter — (760–840 long; 527–585 wide) colorless. Gnathosomal bay (150–162.5 long; 55–62.5 wide). Cxgl-4 apical. **Medial suture** (25–35 long). **Genital plates** (175–190 long; 155–170 wide). Additional measurements: Cx-1 (280–300 long (to-tal); 130–145 long (medial)); Cx-3 (345–380 wide); anterior venter (170–185 long). Ventral proportions: gnathosomal bay length/width 2.58–2.73; anterior venter/genital

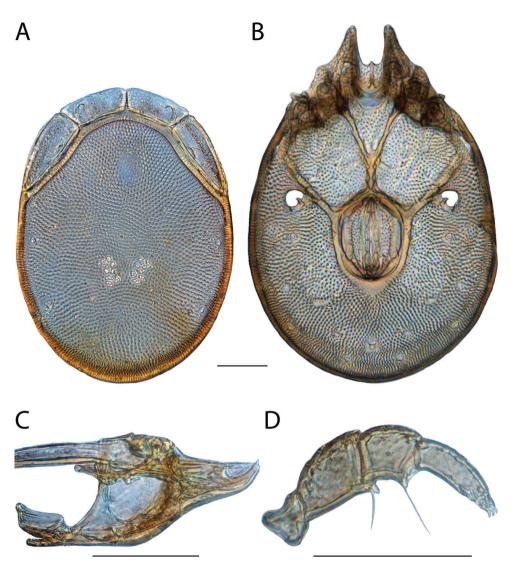

Figure 210. *Torrenticola rala* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

field length 0.92–1.01; anterior venter length/genital field width 1.00–1.19; anterior venter/medial suture 5.00–6.80.

MALE (Figure 210) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (600–655 long; 435–480 wide) ellipsoid and colorless. Anterio-medial platelets (135–165 long; 55–67.5 wide). Anterio-lateral platelets (177.5–190 long; 64–82.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 375–400). Dorsal plate proportions: dorsum length/width 1.35–1.42; dorsal width/distance between Dgl-4 1.16–1.20; anterio-medial platelet length/width 2.40–2.48; anterio-lateral platelet length/width 2.30–2.78; anterio-lateral/anterio-medial length 1.15–1.31.

Gnathosoma — **Subcapitulum** (230–249 long (ventral); 152.5–162.5 long (dorsal); 107.5–112.5 tall) tall and colorless. Rostrum (77.5–81 long; 45–47.5 wide) short and conical. Chelicerae (215–232.5 long) with curved fangs (42.5–50 long). Subcapitular proportions: ventral length/height 2.14–2.21; rostrum length/width 1.63–1.72. **Pedipalps** short and stocky (especially tibiae) with tuberculate ventral extensions on femora and ventral extensions on genua absent. Palpomeres: trochanter (32.5–37.5 long); femur (65–72.5 long); genu (49–52.5 long); tibia (55–62.5 long; 20–21 wide); tarsus (15–17.5 long). Palpomere proportions: femur/genu 1.33–1.45; tibia/femur 0.79–0.89; tibia length/width 2.71–2.94.

Venter — (710–765 long; 500–540 wide) colorless. Gnathosomal bay (135–145 long; 55–62.5 wide). Cxgl-4 apical. **Medial suture** (65–80 long). **Genital plates** (160–185 long; 127.5–135 wide). Additional measurements: Cx-1 (270–295 long (total); 125–145 long (medial)); Cx-3 (337.5–375 wide); anterior venter (200–225 long). Ventral proportions: gnathosomal bay length/width 2.20–2.45; anterior venter/ genital field length 1.14–1.33; anterior venter length/genital field width 1.57–1.67; anterior venter/medial suture 2.66–3.31.

IMMATURES unknown.

Etymology. Cook (1980) did not specify an etymology for this specific epithet (*rala*) and we are unable to offer helpful speculation.

Distribution. Southwestern U.S. (Arizona, New Mexico, Texas) and southward through Central America (Figure 208).

Remarks. Our analyses were unable to confidently place *Torrenticola rala* phylogenetically. The COI analyses recovers this species at the base of the Raptor Complex, but this relationship was not recovered in the combined analysis. Because of this ambiguity, we refrain from placing this species in a species complex. However, based upon the morphological similarity that this species shares with six other species, we place this species within the Rala Identification Group.

T. rala is greater than 13% different in COI sequence from sister species. This species hypothesis is supported by high divergence between species (3-15%) and by the morphological characters outlined in the diagnosis.

Torrenticola raptor Fisher & Dowling, sp. n. http://zoobank.org/29F4761F-CC8C-404C-9679-A85A0EB59EF0

Material examined. HOLOTYPE (Q): from USA, Ontario, Hastings County, Maple Leaf, Papineau Creek, beside Highway 62, 18 Aug 2011, by IM Smith, IMS110054, DNA 2864.

PARATYPES (58 \bigcirc ; 40 \Diamond): Alabama, USA: 3 \bigcirc and 3 \Diamond from Clay County, Talladega Creek, beside Forest Route 649, 0.8 kilometers northeast of road from Forest

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (53 \bigcirc ; 34 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola raptor are similar to other members of the Raptor Group (*T. gnoma, T. irapalpa, T. longitibia, T. mjolniri, T. elusiva, T. racupalpa, T. danielleae, T. daemon,* and *T. ivyae*) in having round bodies; Dgl-4 close to muscles scars; long, thin subcapitular rostra; and long, thin pedipalp tibiae. *T. raptor* can be differentiated from all other members of the Raptor Group by having a more elongate subcapitulum (ventral length/height Q = 2.98-3.18 in *T. raptor,* 2.26–2.90 in others; $\mathcal{J} = 3.13-3.27$ in *T. raptor,* 2.29–3.00 in others). *T. raptor* can be further differentiated from *T. elusiva, T. inpalpa, T. gnoma, T. danielleae, T. daemon,* and *T. ivyae* by having more elongate pedipalp tibiae (length/width Q = 6.00-7.54 in *T. raptor,* 4.09–5.67 in others; $\mathcal{J} = 5.29-5.63$ in *T. raptor,* 3.88–5.20 in others). *T. raptor* can be further differentiated from *T. mjolniri, T. longitibia, T. gnoma, T. elusiva, T. racupalpa,* and *T. ivyae* by having Dgl-4 closer to the dorsal edge (dorsal width/distance between Dgl-4 = 1.66–2.02 in *T. raptor,* 2.06–3.29 in others).

Description. FEMALE (Figure 212) (n = 13) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (570–660 (625) long; 465–550 (505) wide) circular with coloration posteriorly extending in a strip anteriorly to the edge of the dorsal plate (rarely without anterior extension), coloration variable from navy blue to purple to reddish purple. Anterio-medial platelets (122.5–150 (135) long; 60–80 (75) wide). Anterio-lateral

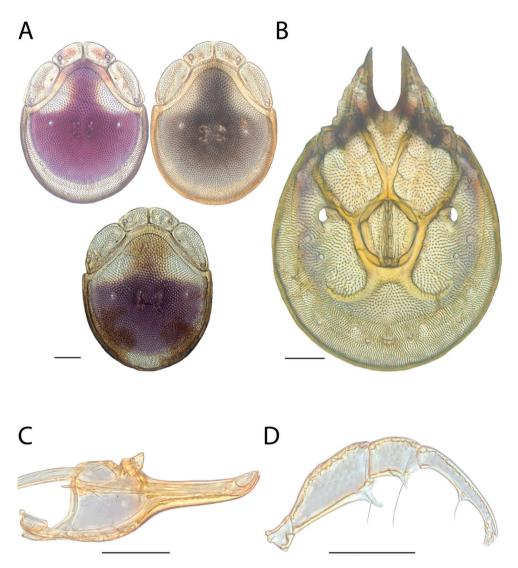

Figure 212. *Torrenticola raptor* sp. n. female: **A** dorsal plates, note color variation **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

platelets (182.5–210 (195) long; 75–90 (80) wide) free from dorsal plate. Dgl-4 closer to the muscle scars than to the dorsum edge (distance between Dgl-4 230–295 (275)). Dorsal plate proportions: dorsum length/width 1.19–1.31 (1.24); dorsal width/distance between Dgl-4 1.80–2.02 (1.84); anterio-medial platelet length/width 1.75–2.07 (1.80); anterio-lateral platelet length/width 2.28–2.49 (2.44); anterio-lateral/ anterio-medial length 1.39–1.57 (1.44).

Gnathosoma — **Subcapitulum** (335–380 (365) long (ventral); 249–283 (270) long (dorsal); 107.5–125 (120) tall) colorless. Rostrum (150–167.5 (160) long; 37.5–

45 (37.5) wide) elongate. Chelicerae (316–368 (355) long) with curved fangs (43–60 (60) long). Subcapitular proportions: ventral length/height 2.98–3.18 (3.04); rostrum length/width 3.44–4.40 (4.27). **Pedipalps** elongate (especially tibiae) with long tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (42.5) long); femur (122.5–143.75 (137.5) long); genu (65–77.5 (70) long); tibia (112.5–142.5 (122.5) long; 16.25–20 (18.75) wide); tarsus (17.5–22.5 (22.5) long). Palpomere proportions: femur/genu 1.68–1.96 (1.96); tibia/femur 0.82–1.03 (0.89); tibia length/width 6.00–7.54 (6.53).

Venter — (720–830 (800) long; 535–609 (550) wide) with faint navy blue to purple coloration or colorless. Gnathosomal bay (135–192.5 (172.5) long; 62.5–85 (75) wide). Cxgl-4 far from apex. **Medial suture** (35–45 (45) long). **Genital plates** (157.5–182.5 (170) long; 135–153.75 (145) wide). Additional measurements: Cx-1 (271–330 (330) long (total); 92–160 (160) long (medial)); Cx-3 (336–373 (340) wide); anterior venter (205–240 (220) long). Ventral proportions: gnathosomal bay length/width 1.74–2.48 (2.30); anterior venter/genital field length 1.23–1.47 (1.29); anterior venter length/genital field width 1.41–1.65 (1.52); anterior venter/medial suture 4.56–6.29 (4.89).

MALE (Figure 213) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–610 (540) long; 415–450 (440) wide) circular with coloration posteriorly extending in a strip anteriorly to the edge of the dorsal plate (rarely without anterior extension), coloration variable from navy blue to purple to reddish purple. Anterio-medial platelets (126.25–132.5 (127.5) long; 57.5–65 (57.5) wide). Anterio-lateral platelets (177.5–190 (177.5) long; 68–80 (75) wide) free from dorsal plate. Dgl-4 closer to the muscle scars than to the dorsum edge (distance between Dgl-4 230–265 (230)). Dorsal plate proportions: dorsum length/width 1.23–1.36 (1.23); dorsal width/distance between Dgl-4 1.66–1.91 (1.91); anterio-medial platelet length/ width 1.94–2.22 (2.22); anterio-lateral platelet length/width 2.34–2.58 (2.37); anterio-lateral/anterio-medial length 1.39–1.47 (1.39).

Gnathosoma — **Subcapitulum** (297.5–327.5 (297.5) long (ventral); 220–247 (221) long (dorsal); 95–102.5 (95) tall) colorless. Rostrum (131.25–147.5 (131.25) long; 30–35 (30) wide) elongate. Chelicerae (274–306 (274) long) with curved fangs (44–54 (45) long). Subcapitular proportions: ventral length/height 3.13–3.27 (3.13); rostrum length/width 3.89–4.38 (4.38). **Pedipalps** elongate (especially tibiae) with long tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–40 (40) long); femur (111.25–122.5 (111.25) long); genu (62.5–65 (62.5) long); tibia (102.5–112.5 (102.5) long; 18.75–21.25 (18.75) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.73–1.88 (1.78); tibia/femur 0.89–0.99 (0.92); tibia length/width 5.29–5.63 (5.47).

Venter — (680–790 (680) long; 457–523 (458) wide) with faint navy blue to purple coloration or colorless. Gnathosomal bay (132.5–145 (132.5) long; 52.5–77.5 (52.5) wide). Cxgl-4 far from apex. **Medial suture** (80–107.5 (80) long). **Genital plates** (137.5–152.5 (141.25) long; 110–125 (120) wide). Additional measurements: Cx-1 (268–322 (269) long (total); 112–160 (113) long (medial)); Cx-3 (332–347 (335) wide); anterior

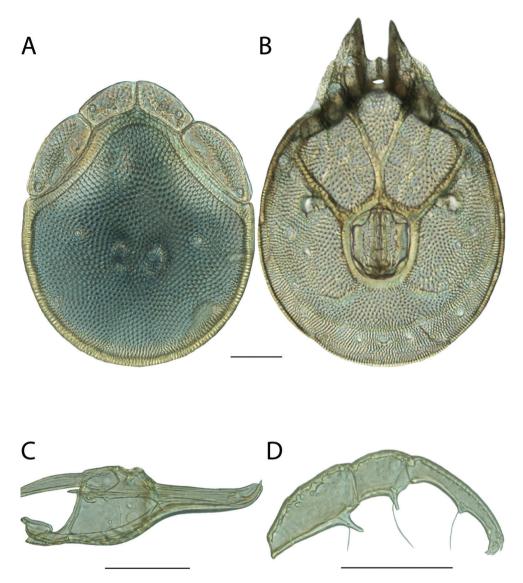

Figure 213. *Torrenticola raptor* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

venter (245–305 (245) long). Ventral proportions: gnathosomal bay length/width 1.81–2.52 (2.52); anterior venter/genital field length 1.73–2.11 (1.73); anterior venter length/ genital field width 2.04–2.60 (2.04); anterior venter/medial suture 2.84–3.06 (3.06).

IMMATURES unknown.

Etymology. Specific epithet (*raptor*) refers to the long, thin pedipalps (especially tibiae) of this species which, combined with pronounced tubercles, appear especially capable of grasping slippery prey (*rapio* L. to seize; known in apposition).

Distribution. Northeastern, but extending southward in the Appalachians (Figure 211).

Remarks. *Torrenticola raptor* groups with other members of the Raptor Complex with high support and specimens of this species are less than 4% different in COI sequence from each other. This is higher sequence variability than in many species hypotheses presented herein. However, given the topology in the COI tree (Figure 7) and morphological similarity, it seems apparent that the variability represents a continuum across a large distribution rather than isolated species, so we consider these specimens to be within the same species hypothesis.

The position of *T. raptor* varied with analysis and was not well-supported in the combined analysis, so we are unable to comment on its affinities. However, morphological similarity is consistent with placing this species in the Raptor Identification Group.

This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Torrenticola raptoroides Fisher & Dowling, sp. n. http://zoobank.org/92C6BF5F-BC02-4D5E-ABFD-140F2247D59F

Material examined. HOLOTYPE (Q): from USA, New Mexico, Catron County, Little Creek, Gila Hot Springs, Little Creek Recreation Area off Route 15, 6 May 2012, by IM Smith, IMS120006, DNA 2895.

PARATYPES (8 \bigcirc ; 8 \checkmark): **Arizona, USA:** 2 \bigcirc and 2 \checkmark from Coconino County, Oak Creek Canyon, Oak Creek, beside Route 89A, between Banjo Bill & Bootlegger campgrounds, 21 Jul 1987, by IM Smith, IMS870100B • 1 \bigcirc from Coconino County, Oak Creek Canyon, Oak Creek, beside Route 89A, just north of Pine Flat campground, 21 Jul 1987, by IM Smith, IMS870099B • 1 \bigcirc and 1 \checkmark from Yavapai County, West Clear Creek at Clear creek campground, off Forest Road 9, east of Camp Verde, 22 Jul 1987, by IM Smith, IMS870102 • **New Mexico, USA:** 1 \circlearrowright (ALLO-TYPE) from Grant County, East Fork Gila River, Grapevine Recreation Area off Route 15, north of Silver City, 5 May 2012, by IM Smith, IMS120007, DNA 2900 • 1 \textdegree from Catron County, Gila River, beside Route 15, just below mouth of Little Creek, 11 Jul 1987, by IM Smith, IMS870083A • 2 \bigcirc and 1 \checkmark from Catron County, Little Creek, Gila Hot Springs, Little Creek Recreation Area off Route 15, 6 May 2012, by IM Smith, IMS120006 • 2 \bigcirc and 2 \checkmark from Catron County, Little Creek, beside Route 15, 65 kilometers north of Route 180 in Silver City, 10 Jul 1987, by IM Smith, IMS870081A.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in the CNC; other paratypes (3 \bigcirc ; 3 \circlearrowright) deposited in ACUA.

Diagnosis. *Torrenticola raptoroides* are unlike all other western species in having round bodies with dorsal coloration restricted posteriorly and long, thin pedipalp tibiae. Additionally, they are only known from Catron & Grant Counties, New Mexico.

Description. FEMALE (Figure 215) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

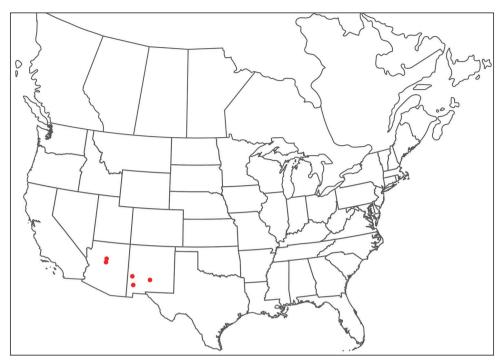

Figure 214. Torrenticola raptoroides sp. n. distribution.

Dorsum — (610–690 (650) long; 485–530 (520) wide) ovoid with navy blue coloration separated into anterior and posterior portions with faint orange medially. Anterio-medial platelets (140–167.5 (157.5) long; 56–67.5 (61.25) wide). Anterio-lateral platelets (165–200 (195) long; 72.5–82.5 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 295–380 (380)). Dorsal plate proportions: dorsum length/width 1.19–1.30 (1.25); dorsal width/distance between Dgl-4 1.37–1.64 (1.37); anterio-medial platelet length/width 2.36–2.60 (2.57); anterio-lateral platelet length/width 2.27–2.60 (2.60); anterio-lateral/anterio-medial length 1.15–1.24 (1.24).

Gnathosoma — **Subcapitulum** (315–335 (330) long (ventral); 240–250 (249) long (dorsal); 135–140 (137.5) tall) colorless. Rostrum (135–142.5 (142.5) long; 40–45 (42.5) wide). Chelicerae (335–360 (345) long) with curved fangs (62–69 (63) long). Subcapitular proportions: ventral length/height 2.25–2.48 (2.40); rostrum length/width 3.17–3.38 (3.35). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–47.5 (45) long); femur (120–131.25 (131.25) long); genu (63.75–75 (72.5) long); tibia (100–112.5 (112.5) long; 21.25–22.5 (22.5) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.60–1.88 (1.81); tibia/femur 0.79–0.94 (0.86); tibia length/width 4.44–5.00 (5.00).

Venter — (710–805 (805) long; 562–600 (562) wide) colorless. Gnathosomal bay (167.5–182.5 (180) long; 72.5–100 (82.5) wide). Cxgl-4 far from apex. **Medial suture** (10–17.5 (12.5) long). **Genital plates** (172.5–182.5 (172.5) long; 167.5–177.5

(167.5) wide). Additional measurements: Cx-1 (300–311 (311) long (total); 111–140 (112) long (medial)); Cx-3 (350–410 (373) wide); anterior venter (150–187.5 (170) long). Ventral proportions: gnathosomal bay length/width 1.83–2.41 (2.18); anterior venter/genital field length 0.86–1.04 (0.99); anterior venter length/genital field width 0.88–1.07 (1.01); anterior venter/medial suture 10.71–16.75 (13.60).

MALE (Figure 216) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

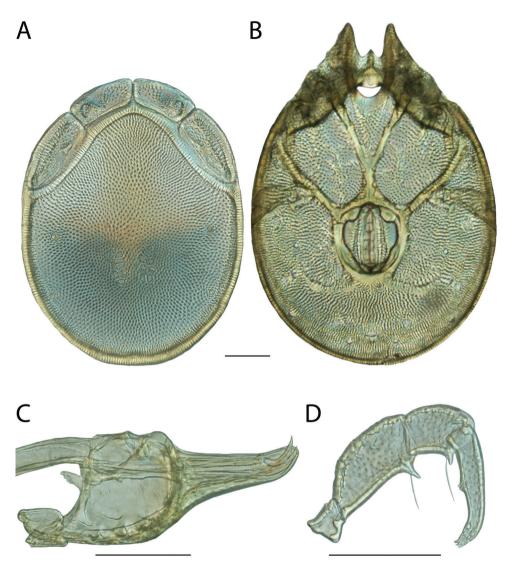

Figure 216. *Torrenticola raptoroides* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Dorsum — (530–605 (590) long; 415–500 (455) wide) ovoid with navy blue coloration separated into anterior and posterior portions with faint orange medially. Anterio-medial platelets (130–147.5 (140) long; 50–62.5 (62.5) wide). Anterio-lateral platelets (170–192.5 (177.5) long; 60–77.5 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 290–365 (320)). Dorsal plate proportions: dorsum length/width 1.21–1.30 (1.30); dorsal width/distance between Dgl-4 1.34–1.43 (1.42); anterio-medial platelet

length/width 2.24–2.60 (2.24); anterio-lateral platelet length/width 2.33–2.83 (2.37); anterio-lateral/anterio-medial length 1.25–1.33 (1.27).

Gnathosoma — **Subcapitulum** (260–300 (290) long (ventral); 197.5–225 (215) long (dorsal); 105–122.5 (112.5) tall) colorless. Rostrum (112.5–127.5 (122.5) long; 37.5–42.5 (40) wide). Chelicerae (255–295 (282) long) with curved fangs (45–64 (64) long). Subcapitular proportions: ventral length/height 2.40–2.58 (2.58); rostrum length/ width 2.94–3.06 (3.06). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–42.5 (40) long); femur (85–113.75 (113.75) long); genu (55–67.5 (67.5) long); tibia (85–107.5 (102.5) long; 20–22.5 (22.5) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.55–1.69 (1.69); tibia/femur 0.90–1.00 (0.90); tibia length/width 4.25–4.78 (4.56).

Venter — (630–710 (710) long; 480–580 (498) wide) colorless. Gnathosomal bay (135–162.5 (157.5) long; 60–72.5 (70) wide). Cxgl-4 far from apex. **Medial suture** (60–70 (62.5) long). **Genital plates** (135–155 (147.5) long; 120–130 (127.5) wide). Additional measurements: Cx-1 (260–300 (280) long (total); 130–155 (131) long (medial)); Cx-3 (330–375 (340) wide); anterior venter (195–235 (227.5) long). Ventral proportions: gnathosomal bay length/width 1.90–2.32 (2.25); anterior venter/ genital field length 1.37–1.66 (1.54); anterior venter length/genital field width 1.56–1.86 (1.78); anterior venter/medial suture 3.25–3.64 (3.64).

IMMATURES unknown.

Etymology. Specific epithet (*raptoroides*) refers to the long, thin pedipalp tibia and long genual/femoral tubercles, which are similar to members of the Raptor Group (*rapio*, L. to seize; *-oides*, G. resembling).

Distribution. Southeastern, Arizona and New Mexico (Figure 214).

Remarks. Our analyses were unable to confidently place *Torrenticola raptoroides* phylogenetically. Both analyses place this species at the base of the Raptor Complex, but this relationship was not well-supported. Because of this ambiguity, we refrain from placing this species in a species complex. Furthermore, because of the unique morphology, we are also unable to place this species within an identification group.

All specimens are less than 1% different in COI sequence and are greater than 15% different from sister species. This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola reduncarostra Fisher & Dowling, sp. n. http://zoobank.org/F3BC5217-1524-4F40-9D2C-549F20E161E9

Diagnosis. *Torrenticola reduncarostra* are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (*T. dunni*, *T. glomerabilis*, *T. kittatinniana*,

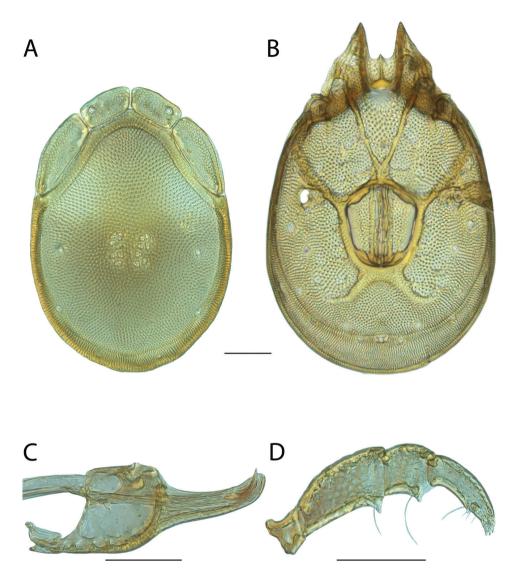

Figure 218. *Torrenticola reduncarostra* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

T. pollani, T. rufoalba and *T. shubini*), Neoanomala Group (*T. interiorensis* and *T. neoanomala*), and *T. bondi, T. gorti, T. elongata, T. erectirostra, T. robisoni, T. irapalpa, T. racupalpa, T. skvarlai, and <i>T. arktonyx. T. reduncarostra* can be differentiated from all *Torrenticola*, except Erectirostra Group, by having an upturned rostrum. *T. reduncarostra* can be differentiated from *T. erectirostra, T. karambita*, and *T. robisoni* by lacking dentation on the rostrum (others have strong dentation on the lateral edge of the rostrum).

Description. FEMALE (Figure 218) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (610–665 (625) long; 420–450 (420) wide) ovoid with faint purple coloration separated into anterior and posterior portions, occasionally colorless. Anterio-medial platelets (120–130 (120) long; 55–57.5 (55) wide). Anterio-lateral platelets (175–205 (185) long; 57.5–67.5 (60) wide) free from dorsal plate. Dgl-4 approximately half-way between the edge of the dorsum and the muscle scars (distance between Dgl-4 280–315 (290)). Dorsal plate proportions: dorsum length/width 1.45–1.5 (1.49); dorsal width/distance between Dgl-4 1.40–1.50 (1.45); anterio-medial platelet length/width 2.18–2.27 (2.18); anterio-lateral platelet length/width 2.59–3.42 (3.08); anterio-lateral/anterio-medial length 1.46–1.58 (1.54).

Gnathosoma — **Subcapitulum** (330–340 (330) long (ventral); 240–255 (240) long (dorsal); 110–120 (120) tall) colorless. Rostrum (130–140 (132.5) long; 35–37.5 (35) wide) elongate and upturned. Chelicerae (345–360 (350) long) with curved fangs (55–60 (55) long). Subcapitular proportions: ventral length/height 2.75–3.09 (2.75); rostrum length/width 3.71–4.00 (3.79). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–50 (47.5) long); femur (115–120 (115) long); genu (62.5–65 (62.5) long); tibia (67.5–72.5 (70) long; 23.75–26.25 (26.25) wide); tarsus (16.25–20 (17.5) long). Palpomere proportions: femur/genu 1.81–1.85 (1.84); tibia/femur 0.58–0.62 (0.61); tibia length/width 2.67–2.85 (2.67).

Venter — (740–800 (740) long; 470–515 (500) wide) colorless. Gnathosomal bay (145–165 (155) long; 65–70 (67.5) wide). Cxgl-4 subapical. **Medial suture** (25–35 (25) long). **Genital plates** (170–192.5 (170) long; 150–157.5 (155) wide). Additional measurements: Cx-1 (290–320 (305) long (total); 150–165 (155) long (medial)); Cx-3 (325–350 (330) wide); anterior venter (190–210 (190) long). Ventral proportions: gnathosomal bay length/width 2.07–2.46 (2.30); anterior venter/genital field length 1.07–1.24 (1.12); anterior venter length/genital field width 1.23–1.40 (1.23); anterior venter/medial suture 6.00–8.10 (7.60).

MALE (Figure 219) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (480–580 (525) long; 295–360 (335) wide) ovoid with faint purple coloration separated into anterior and posterior portions, occasionally colorless. Anterio-medial platelets (95–115 (115) long; 42.5–52.5 (50) wide). Anterio-lateral platelets (165–195 (170) long; 52.5–55 (52.5) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars (distance between Dgl-4 215–255 (220)). Dorsal plate proportions: dorsum length/width 1.51–1.68 (1.57); dorsal width/distance between Dgl-4 1.37–1.52 (1.52); anterio-medial platelet length/width 2.19–2.30 (2.30); anterio-lateral platelet length/width 3.14–3.71 (3.24); anterio-lateral/anterio-medial length 1.48–1.79 (1.48).

Gnathosoma — **Subcapitulum** (255–300 (290) long (ventral); 195–220 (207.5) long (dorsal); 87.5–95 (95) tall) colorless. Rostrum (102.5–120 (110) long; 27.5–32.5 (30) wide) elongate and upturned. Chelicerae (250–300 (300) long) with curved fangs (45–55 (55) long). Subcapitular proportions: ventral length/height 2.91–3.16 (3.05); rostrum length/width 3.54–3.73 (3.67). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–42.5 (42.5) long); femur (90–105

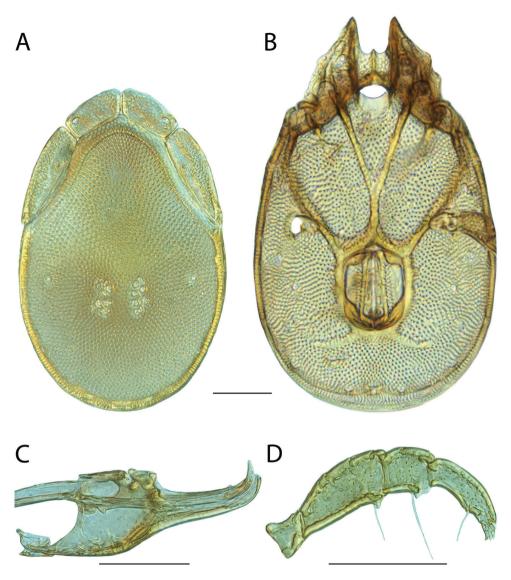

Figure 219. *Torrenticola reduncarostra* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

(102.5) long); genu (52.5–60 (58.75) long); tibia (62.5–72.5 (67.5) long; 22.5–25 (25) wide); tarsus (15–17.5 (17.5) long). Palpomere proportions: femur/genu 1.69– 1.83 (1.74); tibia/femur 0.66–0.72 (0.66); tibia length/width 2.70–3.11 (2.70).

Venter — (595–710 (650) long; 345–410 (370) wide) colorless. Gnathosomal bay (122.5–145 (137.5) long; 57.5–67.5 (57.5) wide). Cxgl-4 subapical. **Medial suture** (75–105 (85) long). **Genital plates** (135–150 (140) long; 100–105 (102.5) wide). Additional measurements: Cx-1 (250–280 (270) long (total); 130–140 (135) long (me-

dial)); Cx-3 (270–300 (295) wide); anterior venter (222.5–257.5 (245) long). Ventral proportions: gnathosomal bay length/width 1.96–2.39 (2.39); anterior venter/genital field length 1.53–1.81 (1.75); anterior venter length/genital field width 2.23–2.45 (2.39); anterior venter/medial suture 2.45–3.19 (2.88).

IMMATURES unknown.

Etymology. Specific epithet (*reduncarostra*) refers to the rostrum, which is curved upwards anteriorly, a rare condition outside of the Erectirostra Group (*reduncus*, L. bent backward; *rostrum*, L. snout).

Distribution. Appalachians (Figure 217).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola reduncarostra* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall appearance, small size, and elongate, ovoid body shape are consistent with placing this species in the Raptor Complex and within the Elongata Identification Group.

Torrenticola regalis Fisher & Dowling, sp. n. http://zoobank.org/DC4A22B6-7EBA-42FC-9DF1-D2AF617CCEC5

Material examined. HOLOTYPE (♂): from USA, Oregon, Curry County, Port Orford, beside Elk River Road, 9 km east of Elk River Fish Hatchery (42°42'22"N, 124°20'28"W), 18 Jun 2010, by IM Smith, IMS100075, DNA 1442.

PARATYPES (2 \bigcirc ; 6 \circlearrowright): **Oregon, USA**: 1 \bigcirc (ALLOTYPE) from Curry County, Port Orford; beside Elk River Road 9.0 km east of Elk River Fish Hatchery, (42°42'42"N, 124°20'20"W), 18 June 2010, by IM Smith, IMS100075 • 1 \bigcirc and 6 \circlearrowright from Curry County, Port Orford; beside Elk River Road 9.0 km east of Elk River Fish Hatchery, (42°42'42"N, 124°20'20"W), 18 June 2010, by IM Smith, IMS100075

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (1 \bigcirc ; 3 \circlearrowright) deposited in the CNC; other paratypes (1 \bigcirc ; 2 \circlearrowright) deposited in ACUA.

Diagnosis. *Torrenticola regalis* can be differentiated from all other western *Torrenticola* by having purple coloration covering the entire dorsal plate and by being the only member of the Miniforma Complex with indistinct or partial hind coxal margins. Occasionally its coloration can look similar to *T. tahoei*, but *T. regalis* can be differentiated from *T. tahoei* by having a shorter anterior venter (200–265 in *T. regalis*, 285–325 in *T. tahoei*), a stockier subcapitulum (ventral length/height = 2.41–2.68 in *T. regalis*, 3.25– 4.11 in *T. tahoei*), and by having indistinct hind coxal margins (distinct in *T. tahoei*).

Description. FEMALE (Figure 221) (n = 2) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (680–695 (695) long; 540–540 (540) wide) circular with purple coloration, excepting platelets. Anterio-medial platelets (152.5–160 (160) long; 65–65 (65) wide). Anterio-lateral platelets (207.5–222.5 (222.5) long; 80–83.75 (83.75) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between Dgl-4 405–420 (420)). Dorsal plate proportions: dorsum length/

Figure 220. Torrenticola regalis sp. n. distribution.

width 1.26–1.29 (1.29); dorsal width/distance between Dgl-4 1.29–1.33 (1.29); anterio-medial platelet length/width 2.35–2.46 (2.46); anterio-lateral platelet length/width 2.59–2.66 (2.66); anterio-lateral/anterio-medial length 1.36–1.39 (1.39).

Gnathosoma — **Subcapitulum** (400–410 (410) long (ventral); 295–307.5 (307.5) long (dorsal); 160–170 (170) tall) colorless. Rostrum (155–165 (165) long; 52.5–55 (55) wide). Chelicerae (410–420 (420) long) with curved fangs (70–75 (70) long). Subcapitular proportions: ventral length/height 2.41–2.50 (2.41); rostrum length/width 2.95–3.00 (3.00). Pedipalps with tuberculate ventral extensions on femora and tuberculate ventral extensions with dentate tip on genua. Palpomeres: trochanter (45–47.5 (45) long); femur (132.5–132.5 (132.5) long); genu (80–85 (85) long); tibia (90–93.75 (93.75) long; 30–30 (30) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.56–1.66 (1.56); tibia/femur 0.68–0.71 (0.71); tibia length/width 3.00–3.13 (3.13).

Venter — (860–860 (860) long; 630–630 (630) wide) colorless. Gnathosomal bay (197.5–205 (205) long; 75–80 (75) wide). Cxgl-4 subapical. **Medial suture** (30–40 (30) long). **Genital plates** (225–232.5 (232.5) long; 205–205 (205) wide). Additional measurements: Cx-1 (340–350 (350) long (total); 140–145 (145) long (medial)); Cx-3 (395–405 (405) wide); anterior venter 200–200 (200) long). Ventral proportions: gnathosomal bay length/width 2.47–2.73 (2.73); anterior venter/genital field length 0.86–0.89 (0.86); anterior venter length/genital field width 0.98–0.98 (0.98); anterior venter/medial suture 5.00–6.67 (6.67).

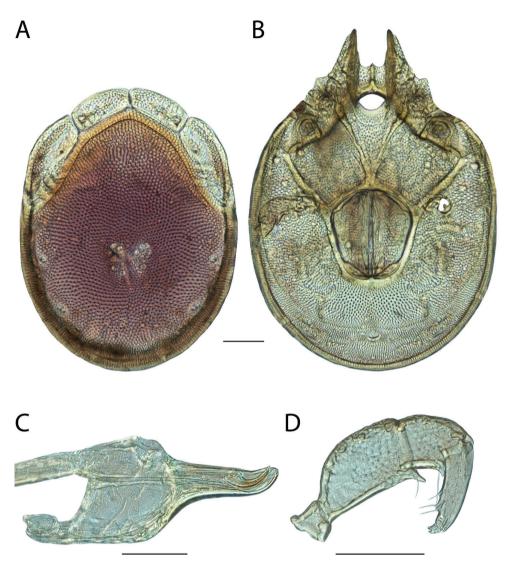

Figure 221. *Torrenticola regalis* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

MALE (Figure 222) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (580–640 (630) long; 465–520 (490) wide) circular with purple coloration, excepting platelets. Anterio-medial platelets (127.5–145 (140) long; 55–67.5 (67.5) wide). Anterio-lateral platelets (177.5–217.5 (203.75) long; 72.5–85 (82.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between Dgl-4 375–420 (400)). Dorsal plate proportions: dorsum length/width 1.23–1.29 (1.29); dorsal width/distance between Dgl-4

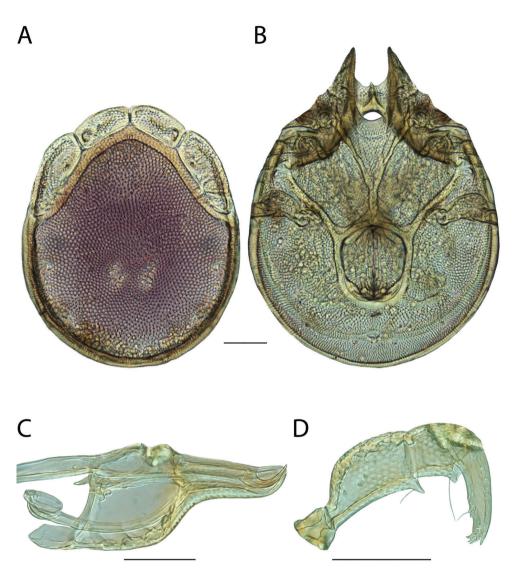

Figure 222. *Torrenticola regalis* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

1.23–1.27 (1.23); anterio-medial platelet length/width 2.07–2.32 (2.07); anteriolateral platelet length/width 2.44–2.64 (2.47); anterio-lateral/anterio-medial length 1.39–1.50 (1.46).

Gnathosoma — **Subcapitulum** (355–375 (365) long (ventral); 255–280 (270) long (dorsal); 132.5–150 (145) tall) colorless. Rostrum (140–150 (145) long; 45–55 (55) wide). Chelicerae (350–375 (365) long) with curved fangs (65–70 (67.5) long). Subcapitular proportions: ventral length/height 2.50–2.68 (2.52); rostrum length/ width 2.64–3.16 (2.64). **Pedipalps** with tuberculate ventral extensions on femora

and tuberculate ventral extensions with dentate tip on genua. Palpomeres: trochanter (41.25–50 (45) long); femur (113.75–125 (125) long); genu (72.5–82.5 (80) long); tibia (82.5–92.5 (92.5) long; 23.75–27.5 (27.5) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions: femur/genu 1.48–1.57 (1.56); tibia/femur 0.71–0.74 (0.74); tibia length/width 3.36–3.50 (3.36).

Venter — (730–780 (770) long; 535–640 (640) wide) colorless. Gnathosomal bay (160–185 (160) long; 72.5–92.5 (92.5) wide). Cxgl-4 subapical. **Medial suture** (75–90 (90) long). **Genital plates** (185–190 (185) long; 145–155 (152.5) wide). Additional measurements: Cx-1 (305–340 (320) long (total); 135–160 (160) long (medial)); Cx-3 (350–410 (410) wide); anterior venter 237.5–265 (265) long). Ventral proportions: gnathosomal bay length/width 1.73–2.55 (1.73); anterior venter/genital field length 1.28–1.43 (1.43); anterior venter length/genital field width 1.62–1.74 (1.74); anterior venter/medial suture 2.64–3.47 (2.94).

IMMATURES unknown.

Etymology. Specific epithet (*regalis*) refers to the coloration of this species, which is nearly colorless except the purple dorsum, giving the appearance of a mite wearing a purple cape, such as those often depicted as worn by royalty (*rēgālis*, L. royal).

Distribution. Known only from Curry County, Oregon (Figure 220).

Remarks. *Torrenticola regalis* groups with other members of the Miniforma Complex with high support and is greater than 17% different from other species in the Ellipsoidalis Identification Group. This species is represented by a single specimen that does not resemble any other species group. This species hypothesis is supported by phylogenetic affinity, high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Torrenticola robisoni Fisher & Dowling, sp. n. http://zoobank.org/F5FEE1EC-3580-4DF8-A138-499D8AABD9E4

Material examined. HOLOTYPE (\bigcirc): from USA, Arkansas, Polk County, East Saline Creek, 30 Jul 2011, by IM Smith, IMS110041

PARATYPES (1 \bigcirc ; 0 \checkmark): **Oklahoma, USA**: Pushmataha County, beside Route 271, Walnut Creek (34°39'N 95°7'W), 1 Jul 1987, by IM Smith, IMS870063A

Type deposition. Holotype (\bigcirc) deposited in the CNC; paratype (1 \bigcirc) deposited in the ACUA.

Diagnosis. *Torrenticola robisoni* are similar to other members of the Erectirostra Group (*T. karambita* and *T. erectirostra*). They are similar to other species with similar dorsal patterning, but can be differentiated from these by having a dentate, upturned rostrum that is wide when viewed ventrally. *T. robisoni* can be differentiated from *T. erectirostra* by having more elongate anterio-lateral platelets (length/width Q = 2.96-3.00 in *T. robisoni*, 2.52–2.69 in *T. erectirostra*). *T. robisoni* can be differentiated from *T. karambita* by having dorsal coloration (*T. karambita* is colorless) and having a more elongate rostrum (length/width Q = 2.09-2.09 in *T. robisoni*, 1.57–1.62 in *T. karambita*). *T. robisoni*

Figure 223. Torrenticola robisoni sp. n. distribution.

can be further differentiated from *T. erectirostra* and *T. karambita* by being distributed in the Interior Highlands, while the others are in the Appalachians.

Description. FEMALE (Figure 224) (n = 2) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (650–670 (650) long; 455–500 (455) wide) ovoid with reddish purple coloration separated into anterior and posterior portions with orange medially. Anterio-medial platelets (147.5–150 (150) long; 60–62.5 (60) wide). Anterio-lateral platelets (200–210 (200) long; 67.5–70 (67.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 305–340 (305)). Dorsal plate proportions: dorsum length/width 1.34–1.43 (1.34); dorsal width/distance between Dgl-4 1.47–1.49 (1.49); anterio-medial platelet length/ width 2.36–2.50 (2.50); anterio-lateral platelet length/width 2.96–3.00 (2.96); anterio-lateral plateral/anterio-medial length 1.33–1.42 (1.33).

Gnathosoma — **Subcapitulum** (325–335 (325) long (ventral); 218–250 (218) long (dorsal); 125–132.5 (132.5) tall) colorless. Rostrum (115–120 (115) long; 55–57.5 (55) wide) wide and upturned with dentation. Chelicerae (315–330 (315) long) with curved fangs (46–50 (46) long). Subcapitular proportions: ventral length/height 2.45–2.68 (2.45); rostrum length/width 2.09–2.09 (2.09). **Pedipalps** short and stocky (especially tibiae) with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (52.5–52.5 (52.5) long); femur (95–107.5 (95) long); genu (60–62.5 (60) long); tibia (47.5–58.75 (47.5) long; 25–27.5 (25) wide); tarsus (15–17.5 (15)

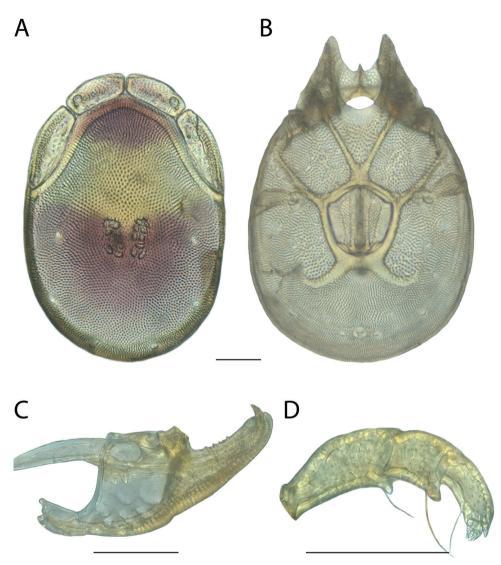

Figure 224. *Torrenticola robisoni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

long). Palpomere proportions: femur/genu 1.58–1.72 (1.58); tibia/femur 0.50–0.55 (0.50); tibia length/width 1.90–2.14 (1.90).

Venter — (779–825 (779) long; 543–550 (543) wide) colorless. Gnathosomal bay (165–190 (165) long; 115–120 (115) wide). Cxgl-4 far from apex. **Medial suture** (12.5–20 (12.5) long). **Genital plates** (168.75–202.5 (202.5) long; 157.5–180 (180) wide). Additional measurements: Cx-1 (308–350 (308) long (total); 142–155 (142) long (medial)); Cx-3 (367–375 (367) wide); anterior venter (182.5–200 (182.5) long). Ventral proportions: gnathosomal bay length/width 1.43–1.58 (1.43); anterior

venter/genital field length 1.05–1.08 (1.08); anterior venter length/genital field width 1.16–1.25 (1.16); anterior venter/medial suture 10.00–14.60 (14.60).

MALE unknown.

IMMATURES unknown.

Etymology. Specific epithet (*robisoni*) named in honor of Henry W. Robison for his efforts in communicating the importance of the Interior Highlands (Ozarks and Ouachitas)—the type locality—which have a high proportion of endemic species, yet are understudied with respect to other areas of increased endemism (e.g., California floristic province, coastal plains, southern Appalachians, Pacific Northwest). His contributions instill passion for the region to even the casual reader, and have inspired many, including JRF, to pursue biodiversity research in the area.

Distribution. Known only from the Ouachita Mountains, possibly endemic (Figure 223).

Remarks. *Torrenticola robisoni* groups with other members of the Raptor Complex with high support. The single *T. robisoni* specimen that we were able to include in our phylogenetic analysis is 8–9% different in COI sequence from *T. erectirostra* and *T. karambita*. Based upon the distinctive morphology of the gnathosoma of these species, we place them in the Erectirostra Identification group.

This species hypothesis is supported by biogeography, high divergence between species, and by morphological characters outlined in the diagnosis.

Torrenticola rockyensis Fisher & Dowling, sp. n. http://zoobank.org/F1B21665-2736-40B5-B1FC-C74B58457661

Material examined. HOLOTYPE (♀): from USA, Idaho, Blaine County, Sawtooth National Forest, Salmon River (43°53'7"N, 114°46'15"W), 29 Jul 2012, by JR Fisher, WA Nelson, & JC O'Neill, ROW 12-0729-002, DNA 2623.

Diagnosis. Torrenticola rockyensis are similar to members of the Miniforma group (*T. copipalpa*, *T. manni*, *T. miniforma*, *T. pacificensis*, *T. oliveri*, and *T. pinocchio*) in having short, stocky pedipalps (except *T. oliveri* and *T. pinocchio*); similar pedipalpal extensions (unique to members of this group); and being among the smallest *Torrenticola* in the west (dorsum 500–625 long) (except *T. oliveri*). *T. rockyensis* can be differentiated from all other Miniforma group by being distributed in the Rocky Mountains. *T. rockyensis* are best differentiated from *T. copipalpa* by having tuberculate pedipalp femoral extensions (broad and flat in *T. copipalpa*). *T. rockyensis* are best differentiated

ated from *T. pacificensis* by females having more elongate subcapitular rostra (length/ width Q = 2.72-2.91 in *T. rockyensis*, 2.59–2.68 in *T. pacificensis*). *T. rockyensis* are best differentiated from *T. manni* by having stockier pedipalp tibiae (length/width = 2.47-3.11 in *T. rockyensis*, 3.13-3.38 in *T. manni*). *T. rockyensis* are best differentiated from *T. miniforma* by being larger (dorsum length Q = 570-620 in *T. rockyensis*, 545 in *T. miniforma*; $\mathcal{F} = 525-545$ in *T. rockyensis*, 485 in *T. miniforma*) and having stockier subcapitular rostra (length/width Q = 2.72-2.91 in *T. rockyensis*, 3.13 in *T. miniforma*; $\mathcal{F} = 2.83-3.00$ in *T. rockyensis*, 3.19 in *T. miniforma*). *T. rockyensis* can be differentiated by having a shorter anterior venter (175–223 in *T. rockyensis*, 250–310 in *T. oliveri*) and less elongate pedipalpal tibiae (length/width = 2.4-3.1 in *T. rockyensis*, 3.6-4.2 in *T. oliveri*). *T. rockyensis* can be differentiated from *T. pinocchio* by having a less elongate rostrum (length/width = 2.7-3.0 in *T. rockyensis*, 4.5-4.9 in *T. pinocchio*).

Description. FEMALE (Figure 226) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (570–620 (620) long; 400–420 (400) wide) ovoid with purple coloration often restricted posteriorly, occasionally encroaching anteriorly nearly to the platelets (one specimen with purple on the platelets). Anterio-medial platelets (110–120 (120) long; 43.75–52.5 (52.5) wide). Anterio-lateral platelets (160–172.5 (172.5) long; 52.5–62.5 (62.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between Dgl-4 290–310 (300)). Dorsal plate proportions: dorsum length/width 1.43–1.55 (1.55); dorsal width/distance between Dgl-4 1.33–1.38 (1.33); anterio-medial platelet length/width 2.19–2.51 (2.29); anterio-lateral platelet length/width 2.76–3.05 (2.76); anterio-lateral/anterio-medial length 1.43–1.55 (1.44).

Gnathosoma — **Subcapitulum** (300–315 (302.5) long (ventral); 222.5–235 (231) long (dorsal); 115–122.5 (117.5) tall) colorless. Rostrum (117.5–130 (123.75) long; 42.5–45 (42.5) wide). Chelicerae (283–310 (283) long) with curved fangs (52.5–68 (67) long). Subcapitular proportions: ventral length/height 2.49–2.68 (2.57); rostrum length/width 2.72–2.91 (2.91). **Pedipalps** short and stocky (especially tibiae) with tuberculate (occasionally broadly tuberculate), dentate ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter 35–42.5 (42.5) long); femur (90–95 (95) long); genu (63.75–67.5 (67.5) long); tibia (62.5–70 (70) long; 21.25–23.75 (22.5) wide); tarsus (12.5–17.5 (15) long). Palpomere proportions: femur/genu 1.38–1.46 (1.41); tibia/femur 0.68–0.74 (1.74); tibia length/width 2.78–3.11 (3.11).

Venter — (615–770 (760) long; 339–470 (455) wide) colorless. Gnathosomal bay (120–147.5 (145) long; 65–80 (67.5) wide). Cxgl-4 subapical. **Medial suture** (42.5–60 (52.5) long). **Genital plates** (172.5–190 (185) long; 157.5–173.75 (170) wide). Additional measurements: Cx-1 (239–279 (279) long (total); 112–133 (121) long (medial)); Cx-3 (247–310 (296) wide); anterior venter (175–202.5 (190) long). Ventral proportions: gnathosomal bay length/width 1.71–2.27 (2.15); anterior venter/ genital field length 0.99–1.07 (1.03); anterior venter length/genital field width 1.08–1.19 (1.12); anterior venter/medial suture 3.13–4.29 (3.62).

MALE (Figure 227) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (525–545 (535) long; 335–350 (350) wide) ovoid with purple coloration often restricted posteriorly, occasionally encroaching anteriorly nearly to the platelets. Anterio-medial platelets (102.5–106.25 (105) long; 45–47.5 (45) wide). Anterio-lateral platelets (145–155 (152.5) long; 52.5–55 (52.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of dorsum than to the muscle scars (distance between

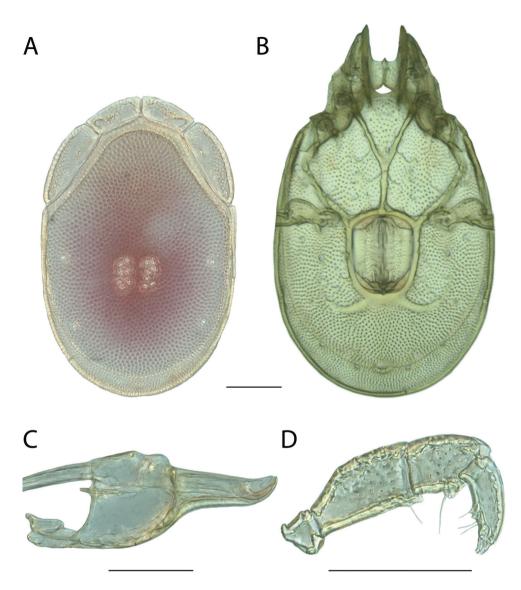

Figure 227. *Torrenticola rockyensis* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Dgl-4 255–285 (280)). Dorsal plate proportions: dorsum length/width 1.53–1.57 (1.53); dorsal width/distance between Dgl-4 1.23–1.31 (1.25); anterio-medial platelet length/width 2.21–2.36 (2.33); anterio-lateral platelet length/width 2.68–2.90 (2.90); anterio-lateral/anterio-medial length 1.36–1.51 (1.45).

Gnathosoma — Subcapitulum (270–285 (285) long (ventral); 197.5–208 (207) long (dorsal); 102.5–107.5 (107.5) tall) colorless. Rostrum (106.25–112.5 (112.5)

long; 36.25–38.75 (37.5) wide). Chelicerae (269–284 (282) long) with curved fangs (41–52 (46) long). Subcapitular proportions: ventral length/height 2.62–2.67 (2.65); rostrum length/width 2.83–3.00 (3.00). **Pedipalps** short and stocky (especially tibiae) with tuberculate (occasionally broadly tuberculate), dentate ventral extensions on femora and dentate, flanged ventral extensions on genua. Palpomeres: trochanter (30–40 (31.25) long); femur (81.25–86.25 (86.25) long); genu (57.5–60 (60) long); tibia (52.5–62.5 (62.5) long; 21.25–22.5 (22.5) wide); tarsus (12.5–15 (15) long). Palpomere proportions: femur/genu 1.41–1.44 (1.44); tibia/femur 0.62–0.74 (0.72); tibia length/width 2.47–2.82 (2.78).

Venter — (580–690 (690) long; 352–420 (385) wide) colorless. Gnathosomal bay (130–140 (140) long; 57.5–62.5 (62.5) wide). Cxgl-4 subapical. **Medial suture** (75–92.5 (92.5) long). **Genital plates** (137.5–147.5 (143.75) long; 105–113.75 (110) wide). Additional measurements: Cx-1 (234–266 (266) long (total); 98.25–137 (136) long (medial)); Cx-3 (245–270 (260) wide); anterior venter (197.5–222.5 (215) long). Ventral proportions: gnathosomal bay length/width 2.12–2.26 (2.24); anterior venter/ genital field length 1.42–1.51 (1.50); anterior venter length/genital field width 1.82–1.98 (1.95); anterior venter/medial suture 2.32–2.73 (2.32).

IMMATURES unknown.

Etymology. Specific epithet (*rockyensis*) refers to the distribution of this species in the Rocky Mountains. This location-based naming reflects that locality is the easiest way to differentiate this species from others in the Miniforma Group, particularly *T. pacificensis*.

Distribution. Rocky Mountains of Idaho and Montana (Figure 225).

Remarks. *Torrenticola rockyensis* groups with other members of the Miniforma group in all analyses with high support. All specimens are less than 1% different in COI sequence from each other and are greater than 5% different from other members of the group. This species is the only member of the Miniforma group that occurs in the Rocky Mountains.

This species hypothesis is supported by non-overlapping distributions, low COI divergence within the species, and high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Torrenticola rockyensis groups with other members of the Miniforma Complex with high support and specimens of this species are less than 1% different in COI sequence from each other. In all analyses, *T. rockyensis* groups with three other morphologically similar species: *T. pacificensis*, *T. manni*, and *T. copipalpa*. *Torrenticola rockyensis* is greater than 5% different from the other three species in COI sequence and is the only one of the four to occur in the Rocky Mountains.

Based upon overall similarity, the pedipalp genu extensions, and western distribution, we were able to place this species in the Miniforma Identification Group.

This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola rufoalba Habeeb, 1955

Torrenticola anomala rufoalba Habeeb, 1955: 2. *Torrenticola rufoalba* Habeeb, 1957: 5.

Material examined. HOLOTYPE (\mathcal{O}): from USA, New Jersey, Morris County, Brook, Brookside, 20 May 1953, by H Habeeb.

PARATYPES (1 \bigcirc and 0 \bigcirc): **New Jersey, USA**: 1 \bigcirc (ALLOTYPE) from Sussex County, Little Flatbrook, north of Bevans, 12 Oct 1953, by H Habeeb.

Type deposition. Holotype (\circlearrowleft) and allotype (\updownarrow) deposited in the CNC.

Diagnosis. Torrenticola rufoalba are similar to other members of the Rusetria "4-Plates" group (T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, and T. shubini) and T. skvarlai in having anterio-lateral platelets free from the dorsal plate, dorsal coloration separated into anterior and posterior portions, and indistinct hind coxal margins. Male T. rufoalba can be differentiated from other male Rusetria four plates by having a shorter anterior venter (195 in T. rufoalba, 215-285 in others). T. ru*foalba* can be differentiated from *T. dunni* by having a shorter dorsum ($\mathcal{Q} = 550$ in T. rufoalba, 605–680 in T. dunni; $\mathcal{E} = 440$ in T. rufoalba, 500–540 in T. dunni) and a thinner dorsum (\mathcal{Q} = 400 in *T. rufoalba*, 440–490 in *T. dunni*; \mathcal{J} = 320 in *T.* rufoalba, 350-370 in T. dunni). T. rufoalba can be differentiated from T. pollani by having a stockier rostrum (length/width = 2.96–3.06 in *T. rufoalba*, 3.27–3.82 in *T.* pollani). Female T. rufoalba can be differentiated from female T. pollani by having stockier tibiae (length/width = 3.5 in T. rufoalba, 3.8-4.2 in T. pollani). T. rufoalba can be differentiated from T. shubini by having a more elongate rostrum (length/ width = 2.96–3.06 in T. rufoalba, 2.24–2.92 in T. shubini). Female T. rufoalba can be differentiated from female T. shubini by having a wider genital field (157.5 in T. rufoalba, 137-145 in T. shubini). T. rufoalba can be differentiated from T. glomerabilis and by having more elongate anterio-medial platelets (length/width = 2.45-2.61 in T. rufoalba, 1.9–2.3 in T. glomerabilis) and thinner dorsum (Q = 400 in T. rufoalba, 460–490 in T. glomerabilis; \bigcirc = 320 in T. rufoalba, 395–430 in T. glomerabilis). T. *rufoalba* can be differentiated from *T. kittatinniana* by having a shorter dorsum (\mathcal{Q} = 550 in *T. rufoalba*, 640 in *T. kittatinniana*; 👌 = 440 in *T. rufoalba*, 500 in *T. kittatin*niana) and stockier anterio-medial platelets (length/width = 2.45–2.61 in T. rufoalba, 2.83-2.88 in T. kittatinniana). T. rufoalba can be differentiated from T. skvarlai by having a conical pedipalpal femoral tubercle, whereas T. skvarlai has a broad and flat pedipalpal femoral tubercle.

Re-description. FEMALE (Figure 229) (n = 1) (allotype only) with characters of the genus with following specifications.

Dorsum — (550 long; 400 wide) ovoid with reddish-purple coloration separated into anterior and posterior portions with a strip of orange medially. Anterio-medial platelets (107.5 long; 41.25 wide). Anterio-lateral platelets (168.75 long; 55 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 255). Dorsal plate proportions: dorsum length/width 1.38;

Figure 228. Torrenticola rufoalba distribution.

dorsal width/distance between Dgl-4 1.57; anterio-medial platelet length/width 2.61; anterio-lateral platelet length/width 3.07; anterio-lateral/anterio-medial length 1.57.

Gnathosoma — **Subcapitulum** (310 long (ventral); 235 long (dorsal); 127.5 tall) colorless. Rostrum (130 long; 42.5 wide). Chelicerae (315 long) with curved fangs (62.5 long). Subcapitular proportions: ventral length/height 2.43; rostrum length/ width 3.06. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5 long); femur (115 long); genu (65 long); tibia (87.5 long; 25 wide); tarsus (17.5 long). Palpomere proportions: femur/genu 1.77; tibia/femur 0.76; tibia length/width 3.50.

Venter — (640 long; 450 wide) mostly colorless with reddish-purple coloration in areas surrounding coxae. Gnathosomal bay (142.5 long; 92.5 wide). Cxgl-4 subapical. **Medial suture** (17.5 long). **Genital plates** (167.5 long; 155 wide). Additional measurements: Cx-1 (125 long (total); 125 long (medial)); Cx-3 (335 wide); anterior venter (155 long). Ventral proportions: gnathosomal bay length/width 1.54; anterior venter/genital field length 0.93; anterior venter length/genital field width 1.00; anterior venter/ter/medial suture 8.86.

MALE (Figure 230) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum — (440 long; 320 wide) ovoid with reddish-purple coloration separated into anterior and posterior portions with a strip of orange medially. Anterio-medial

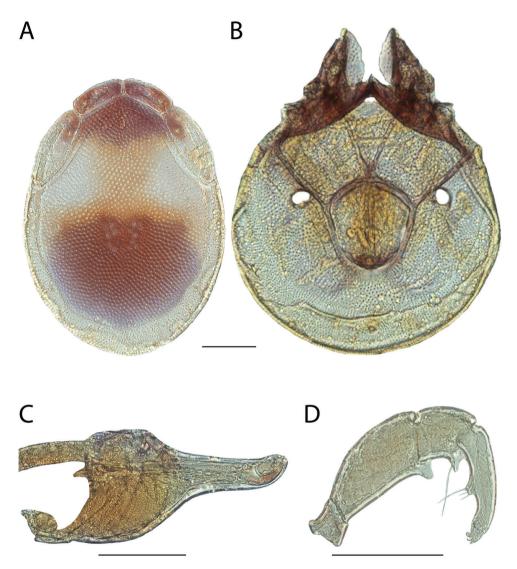

Figure 229. *Torrenticola rufoalba* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

platelets (95 long; 38.75 wide). Anterio-lateral platelets (142.5 long; 47.5 wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 237.5). Dorsal plate proportions: dorsum length/width 1.38; dorsal width/distance between Dgl-4 1.35; anterio-medial platelet length/width 2.45; anterio-lateral platelet length/width 3.00; anterio-lateral/anterio-medial length 1.50.

Gnathosoma — Subcapitulum (257.5 long (ventral); 190 long (dorsal); 95 tall) colorless. Rostrum (103.75 long; 35 wide). Chelicerae (237.5 long) with curved fangs (50 long). Subcapitular proportions: ventral length/height 2.71; rostrum length/width

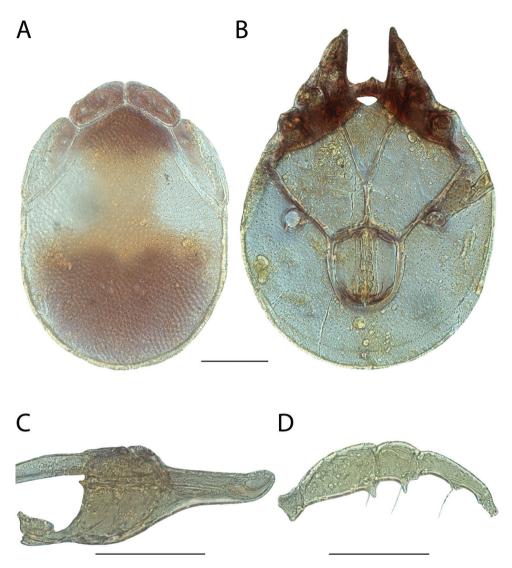

Figure 230. *Torrenticola rufoalba* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

2.96. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35 long); femur (92.5 long); genu (55 long); tibia (76.25 long; 21.25 wide); tarsus (17.5 long). Palpomere proportions: femur/genu 1.68; tibia/femur 0.82; tibia length/width 3.59.

Venter — (530 long; 400 wide) mostly colorless with reddish-purple coloration in areas surrounding coxae. Gnathosomal bay (120 long; 67.5 wide). Cxgl-4 subapical. **Medial** suture (72.5 long). **Genital plates** (120 long; 97.5 wide). Additional measurements: Cx-1 (235 long (total); 112.5 long (medial)); Cx-3 (280 wide); anterior venter (195 long). Ventral proportions: gnathosomal bay length/width 1.78; anterior venter/genital field length 1.63; anterior venter length/genital field width 2.00; anterior venter/medial suture 2.69.

IMMATURES unknown.

Etymology. Habeeb (1955) did not specify an etymology for this specific epithet (*rufoalba*). However, we speculate that it refers to the dorsal coloration as Habeeb (1955) notes, "color red and white" (*rufus*, L. red; *albus*, L. white).

Distribution. Northern New Jersey (Figure 228).

Remarks. Unfortunately, we were unable to acquire more specimens of *Torrenticola rufoalba* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine the holotype. Based upon overall similarity, the fusion of the posterio-lateral platelets, and distribution, this species clearly groups with the Rusetria Complex and can be placed into the Eastern 2-Plate Identification Group.

Torrenticola sellersorum Fisher & Dowling, sp. n. http://zoobank.org/E42D30E2-9FF8-4BFD-8431-7F20BB2AD9E0

Figure 231. Torrenticola sellersorum sp. n. distribution.

Diagnosis. Torrenticola sellersorum are similar to other members of the Rusetria "Eastern 2-Plates" group (T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malarkeyorum, T. pendula, T. tysoni, T. ululata, T. whitneyae, T. microbiscutella, and T. feminellai) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except T. ululata and T. indistincta), and being distributed in the east. It is one of only four Eastern 2-Plates that have dark, bold, bluish-purple coloration (also *T. tysoni*, *T. biscutella*, and *T. pendula*). T. sellersorum can be differentiated from T. ululata, T. indistincta, and T. feminellai by dorsal coloration and pattern. T. sellersorum can be differentiated from T. tysoni by having a stockier rostrum (length/width Q = 2.44-2.68 in *T. sellersorum*, 3.06-3.31 in *T.* tysoni; $\delta = 2.71 - 3.05$ in T. sellersorum, 3.14 - 3.50 in T. tysoni). Female T. sellersorum can be differentiated from female T. biscutella by anterior venter/genital field length (0.69-0.77 in T. sellersorum, 0.82-0.88 in T. biscutella). Male T. sellersorum can be differentiated from male *T. biscutella* by having slightly more elongate anterio-lateral platelets (length/width = 2.76-3.00 in T. sellersorum, 2.58-2.74 in T. biscutella). T. sellersorum can be differentiated from T. pendula by having a stockier gnathosomal bay (length/width = 1.56-2.08 in T. sellersorum, 2.42-2.90 in T. pendula) and more elongate tibiae (length/width = 3.13-3.8 in T. sellersorum, 2.78-3.05 in T. pendula). T. sellersorum can be differentiated from T. whitneyae by having more elongate pedipalpal tibiae (length/width = 3.13-3.80 in T. sellersorum, 2.42-2.95 in T. whitneyae). T. sellersorum can be differentiated from T. microbiscutella by having a less elongate dorsum

(length/width = 1.23-1.54 in *T. sellersorum*, 1.63-1.75 in *T. microbiscutella*). Female *T. sellersorum* can be differentiated from female *T. malarkeyorum* by anterior venter/genital field length (0.69-0.77 in *T. sellersorum*, 0.85-0.89 in *T. malarkeyorum*). Female *T. sellersorum* can be differentiated from female *T. caerulea* by having a wider genital field (150-182 in *T. sellersorum*, 120-145 in *T. caerulea*). Female *T. sellersorum* can be differentiated from female *T. caerulea*). Female *T. sellersorum* can be differentiated from female *T. caerulea*). Female *T. sellersorum* can be differentiated from female *T. caerulea*). Female *T. sellersorum* can be differentiated from female *T. delicatexa* by having a rounder dorsum (length/width = 1.23-1.37 in *T. sellersorum*, 1.38-1.44 in *T. delicatexa*). Male *T. sellersorum* do not have any measurement differences with male *T. malarkeyorum*, *T. caerulea*, and *T. delicatexa*; however, they can be differentiated by dorsal coloration.

Description. FEMALE (Figure 232) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–650 (540) long; 400–520 (400) wide) ovoid with bold (occasionally faint) bluish-purple coloration separated into anterior and posterior portions with a thin or thick strip of red medially. Anterio-medial platelets (112.5–135 (117.5) long; 35–50 (35) wide). Anterio-lateral platelets (147.5–172.5 (147.5) long; 47.5–75 (47.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 290–370 (295)). Dorsal plate proportions: dorsum length/width 1.23–1.37 (1.35); dorsal width/distance between Dgl-4 1.35–1.42 (1.36); anterio-medial platelet length/width 2.65–3.36 (3.36); anterio-lateral platelet length/width 2.23–3.11 (3.11); anterio-lateral/anterio-medial length 1.26–1.36 (1.26).

Gnathosoma — **Subcapitulum** (282.5–330 (285) long (ventral); 210–245 (219) long (dorsal); 130–157.5 (135) tall) colorless. Rostrum (110–125 (113.75) long; 42.5–47.5 (42.5) wide). Chelicerae 280–325 (280) long) with curved fangs (51–66 (62) long). Subcapitular proportions: ventral length/height 2.05–2.17 (2.11); rostrum length/width 2.44–2.68 (2.68). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (40–50 (42.5) long); femur (107.5–122.5 (110) long); genu (62.5–72.5 (65) long); tibia (82.5–95 (85) long; 22.5–27.5 (22.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.69–1.85 (1.69); tibia/femur 0.75–0.79 (0.77); tibia length/width 3.14–3.80 (3.78).

Venter — (640–800 (645) long; 449–529 (470) wide) colorless. Gnathosomal bay (132.5–187.5 (157.5) long; 82.5–97.5 (82.5) wide). Cxgl-4 subapical. **Medial suture** (0–10 (0) long) often absent. **Genital plates** (160–195 (165) long; 150–181.25 (157.5) wide). Additional measurements: Cx-1 (230–322 (270) long (total); 83–126 (106) long (medial)); Cx-3 (310–365 (319) wide); anterior venter (120–142.5 (120) long). Ventral proportions: gnathosomal bay length/width 1.56–2.08 (1.91); anterior venter/genital field length 0.69–0.77 (0.73); anterior venter length/genital field width 0.74–0.80 (0.76); anterior venter/medial suture (proportion cannot be calculated for specimens without a medial suture) 12.25–17.00.

MALE (Figure 233) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (390–470 (400) long; 255–330 (280) wide) ovoid with bold (occasionally faint) bluish-purple coloration separated into anterior and posterior portions

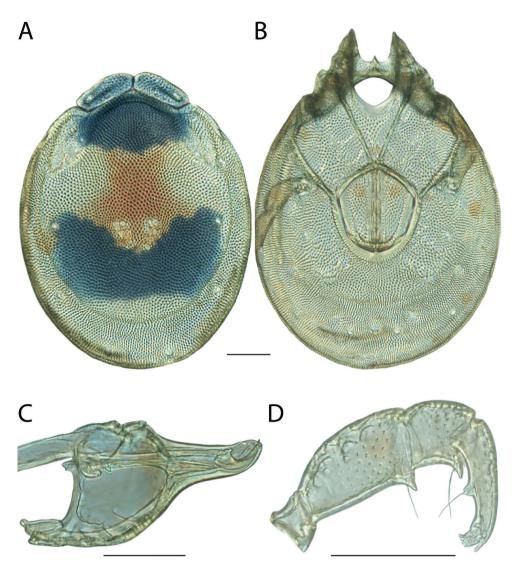

Figure 232. *Torrenticola sellersorum* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

with a thin or thick strip of red medially. Anterio-medial platelets (82.5–97.5 (82.5) long; 30–40 (30) wide). Anterio-lateral platelets (112.5–145 (120) long; 37.5–52.5 (42.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 190–250 (220)). Dorsal plate proportions: dorsum length/width 1.42–1.54 (1.43); dorsal width/distance between Dgl-4 1.27–1.34 (1.27); anterio-medial platelet length/width 2.44–2.83 (2.75); anterio-lateral platelet length/width 2.76–3.00 (2.82); anterio-lateral/anterio-medial length 1.32–1.49 (1.45).

Gnathosoma — **Subcapitulum** (205–245 (215) long (ventral); 151–179 (166) long (dorsal); 80–107.5 (91.25) tall) colorless. Rostrum 80–95 (85) long; 27.5–35 (30) wide). Chelicerae (195–235 (208) long) with curved fangs (40–50 (46) long). Subcapitular proportions: ventral length/height 2.24–2.59 (2.36); rostrum length/ width 2.71–3.05 (2.83). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (30–38.75 (30) long); femur (75–87.5 (80) long); genu

(46.25–52.5 (50) long); tibia (62.5–70 (67.5) long; 18.75–21.25 (20) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.60–1.67 (1.60); tibia/femur 0.79–0.87 (0.84); tibia length/width 3.13–3.47 (3.38).

Venter — (465–570 (490) long; 290–367 (325) wide) colorless. Gnathosomal bay (105–135 (117.5) long; 57.5–66.25 (65) wide). Cxgl-4 subapical. **Medial suture** (57.5–72.5 (57.5) long). **Genital plates** (102.5–122.5 (107.5) long; 91.25–115 (96.25) wide). Additional measurements: Cx-1 (189–237 (199) long (total); 79–96 (85) long (medial)); Cx-3 (230–290 (232) wide); anterior venter (150–185 (150) long). Ventral proportions: gnathosomal bay length/width 1.75–2.08 (1.81); anterior venter/genital field length 1.39–1.59 (1.40); anterior venter length/genital field width 1.55–1.78 (1.56); anterior venter/medial suture 2.32–2.61 (2.61).

IMMATURES unknown.

Etymology. Specific epithet (*sellersorum*) named in honor of the grandparents of DMF, who always supported and encouraged her love of nature and discovery.

Distribution. Widespread (Figure 231). *T. sellersorum* are unlike all other *Torrenticola* in our collections in that they span either side of the Great Plains, which act as a barrier for most other species. *T. sellersorum* are likely absent from cool, highland streams of the Appalachians, Interior Highlands, and Rocky Mountains, but are likely widely distributed throughout the Interior. Explaining the peculiar distribution of *T. sellersorum* will depend on knowledge of dispersal capabilities, including host preference by the larvae and the dispersal capabilities of the host.

Remarks. In all analyses, *Torrenticola sellersorum* groups with other members of the Rusetria Complex with high support and specimens of this species are less than 2.3% different in COI sequence from each other. In all analysis, *T. sellersorum* groups with other eastern members of the Rusetria Complex that have fused lateral platelets. Because of this, we are able to place this species in the Eastern 2-Plate Identification Group.

The slightly increased COI variation of this species (2.3%) is expected for specimens separated by great geographic distance. For example, the specimens from Pennsylvania are 0-1.3% different from each other and the specimens from Saskatchewan are 0.3% different from each other, but Pennsylvania specimens are 1.3-2.0% different from the Saskatchewan specimens. However, even specimens from New Mexico are only 2.0-2.3% different from other localities, despite being separated by great geographic distance and ecoregions that act as barriers for other *Torrenticola* (i.e., the Great Plains). This variation in COI in the New Mexico samples supports two hypotheses: 1) given the relatively low divergence of approximately 2%, New Mexico specimens represent the same species as specimens further east; and conversely, 2) given the relatively high divergence of greater than 1%, New Mexico specimens represent a long-standing population, not a recent introduction from the east.

This species hypothesis is supported by low COI divergence within the species (0-2.3%) (but see above discussion) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola sharkeyi Fisher & Dowling, sp. n. http://zoobank.org/4785F071-6FDF-4732-A1D2-67B6CDD0CB86

Material examined. HOLOTYPE (Q): from USA, New Mexico, Catron County, Gila Hot Springs, Little Creek Recreational Area, Little Creek, off Route 15, 6 May 2012, by IM Smith, IMS120006, DNA 2891.

PARATYPES (13 \bigcirc ; 11 \eth): **Arizona, USA:** 2 \bigcirc and 2 \circlearrowright from Coconino County, Oak Creek Canyon, Oak Creek, beside Route 89A, between Banjo Bill & Bootlegger campgrounds, 21 Jul 1987, by IM Smith, IMS870100A & IMS870100B • 1 \bigcirc and 1 \bigcirc from Yavapai County, West Clear Creek at Clear Creek campground, off Forest Road 9, east of Camp Verde, 19-22 Jul 1987, by IM Smith, IMS870098 & IMS870102 • New Mexico, USA: 1 \bigcirc and 1 \bigcirc from Catron County, Gila Cliff Dwellers National Monument, West Fork of Gila River, 10 Jul 1987, by IM Smith, IMS870080A • 1 👌 (ALLOTYPE) from Catron County, Gila Hot Springs, Little Creek, Little Creek Recreational Area off Route 15, 6 May 2012, by IM Smith, IMS120006, DNA 2892 • 1 \bigcirc and 1 \bigcirc from Catron County, Gila River, beside Route 15, just below mouth of Little Creek, 11 Jul 1987, by IM Smith, IMS870083A • 2 \bigcirc and 1 \checkmark from Catron County, Gila Hot Springs, Little Creek, Little Creek Recreational Area off Route 15, 6 May 2012, by IM Smith, IMS120006 \bullet 2 \bigcirc and 3 I from Catron County, Little Creek, beside Route 15, 65 kilometers north of Route 180 in Silver City, 10 Jul 1987, by IM Smith, IMS870081A \bullet 3 \bigcirc and 2 \checkmark from Grant County, Gila River Recreation Area, East Fork of Gila River, beside Route 15, 11 Jul 1987, by IM Smith, IMS870082A • 1 \bigcirc and 1 \bigcirc from Grant County, Grapevine Recreational Area, East Fork of Gila River, off Route 15 north of Silver City, 5 May 2012, by IM Smith, IMS120007.

Type deposition. Holotype (\bigcirc), allotype (\eth), and most paratypes (8 \bigcirc ; 5 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola sharkeyi is unlike all other western species by having the following combination of characters: dorsal coloration, although faint, restricted posteriorly; indistinct hind coxal margins; and ellipsoid body. It is only known from Catron & Grant Counties, New Mexico. It is most similar to members of the Rala Group (*T. rala, T. keesdavidsi, T. kurtvietsi, T. boettgeri, T. lamellipalpis, T. dolichodactyla*, and *T. anoplopalpa*); however, members of this group are colorless. *T. sharkeyi* can be differentiated from *T. boettgeri, T. kurtvietsi, T. lamellipalpis, T. keesdavidsi,* and *T. anoplopalpa* by having tuberculate ventral extensions on the pedipalpal femora (others are lacking extensions, have dentate flanged extensions or wide lamellate extensions). *T. sharkeyi* can be differentiated from *T. rala, T. kurtvietsi, T. boettgeri, T. boettgeri, T. dolichodactyla* and *T. anoplopalpa* by having a more elongate pedipalpal tibiae (length/width = 3.81–4.10 in *T. sharkeyi,* 1.75–3.38 in others). *T. sharkeyi* can be differentiated from *T. lamellipalpis, T. anoplopalpa* by having a stockier subcapitulum (ventral length/width = 2.03–2.40 in *T. sharkeyi,* 2.51–4.16 in others).

Description. FEMALE (Figure 235) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Figure 234. Torrenticola sharkeyi sp. n. distribution.

Dorsum — (650–750 (715) long; 450–530 (490) wide) ovoid with faint bluishpurple coloration restricted posteriorly or colorless. Anterio-medial platelets (130–155 (137.5) long; 50–57.5 (52.5) wide). Anterio-lateral platelets (187.5–225 (202.5) long; 62.5–75 (67.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 305–360 (335)). Dorsal plate proportions: dorsum length/width 1.41–1.46 (1.46); dorsal width/distance between Dgl-4 1.38–1.52 (1.46); anterio-medial platelet length/width 2.60–2.77 (2.62); anteriolateral platelet length/width 2.91–3.08 (3.00); anterio-lateral/anterio-medial length 1.39–1.47 (1.47).

Gnathosoma — **Subcapitulum** (300–335 (310) long (ventral); 215–245 (227) long (dorsal); 135–157.5 (152.5) tall) colorless. Rostrum (117.5–137.5 (125) long; 45–55 (46.25) wide). Chelicerae (290–340 (314) long) with curved fangs (62.5–70 (68) long). Subcapitular proportions: ventral length/height 2.03–2.25 (2.03); rostrum length/width 2.45–2.89 (2.70). **Pedipalps** with short tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–50 (50) long); femur (112.5–132.5 (125) long); genu (66.25–75 (68.75) long); tibia (100–107.5 (105) long; 25–27.5 (26.25) wide); tarsus (23.75–27.5 (27.5) long). Palpomere proportions: femur/genu 1.67–1.83 (1.82); tibia/femur 0.81–0.91 (0.84); tibia length/width 3.91–4.10 (4.00).

Venter — (730–880 (870) long; 513–610 (543) wide) colorless. Gnathosomal bay (145–186.25 (181.25) long; 92.5–105 (105) wide). Cxgl-4 apical. **Medial suture** (20–25 (20) long). **Genital plates** (177.5–200 (200) long; 157.5–180 (167.5)

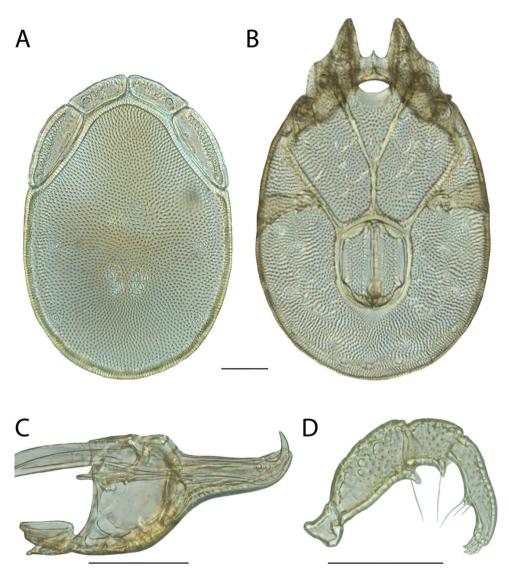

Figure 235. *Torrenticola sharkeyi* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

wide). Additional measurements: Cx-1 (280–350 (323) long (total); 125–160 (140) long (medial)); Cx-3 (365–405 (365) wide); anterior venter (167.5–186.25 (181.25) long). Ventral proportions: gnathosomal bay length/width 1.57–1.84 (1.73); anterior venter/genital field length 0.91–0.97 (0.91); anterior venter length/genital field width 1.03–1.08 (1.08); anterior venter/medial suture 7.30–9.25 (9.06).

MALE (Figure 236) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

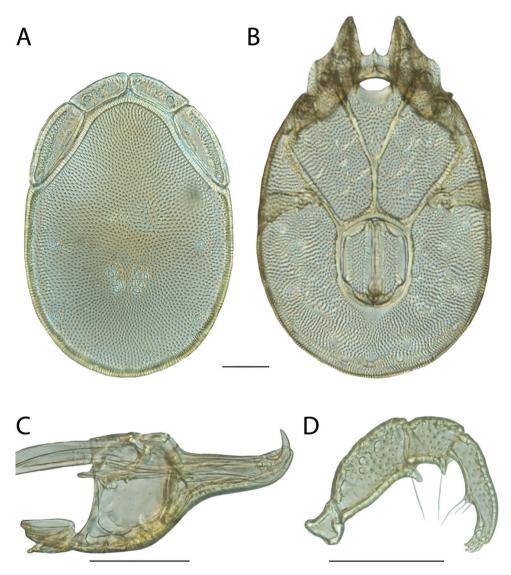

Figure 236. *Torrenticola sharkeyi* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Dorsum — (580–650 (650) long; 415–470 (470) wide) ovoid with faint bluishpurple coloration restricted posteriorly or colorless. Anterio-medial platelets (125– 137.5 (137.5) long; 40–60 (60) wide). Anterio-lateral platelets (180–197.5 (197.5) long; 62.5–82.5 (82.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 280–320 (320)). Dorsal plate proportions: dorsum length/width 1.36–1.44 (1.38); dorsal width/distance between Dgl-4 1.46–1.49 (1.47); anterio-medial platelet length/width 2.29–3.13 (2.29); anterio-lateral platelet length/width 2.39–2.96 (2.39); anterio-lateral/anterio-medial length 1.37–1.51 (1.44).

Gnathosoma — **Subcapitulum** (250–300 (300) long (ventral); 195–216 (215.75) long (dorsal); 105–127.5 (127.5) tall) colorless. Rostrum (100–119 (118.75) long; 37.5–50 (42.5) wide). Chelicerae (270–303 (303) long) with curved fangs (46–50 (47) long). Subcapitular proportions: ventral length/height 2.31–2.40 (2.35); rostrum length/width 2.30–2.91 (2.79). **Pedipalps** with short tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (45–47.5 (47.5) long); femur (102.5–115 (110) long); genu (57.5–67.5 (67.5) long); tibia (88–104 (103.75) long; 22.5–27 (26.25) wide); tarsus (22.5–27.5 (22.5) long). Palpomere proportions: femur/genu 1.63–1.80 (1.63); tibia/femur 0.83–0.94 (0.94); tibia length/width 3.80–3.95 (3.95).

Venter — $(670-771 (770) \text{ long}; 460-520 (496) \text{ wide}) \text{ colorless. Gnathosomal bay (127.5-170 (170) long; 80-90 (90) wide). Cxgl-4 apical.$ **Medial suture**(85-105 (100) long).**Genital plates**(177.5-202 (201.25) long; 135-147.5 (147.5) wide). Additional measurements: Cx-1 (270-315 (305) long (total); 140-157.5 (157.5) long (medial)); Cx-3 (325-370 (360) wide); anterior venter (237.5-270 (270) long). Ventral proportions: gnathosomal bay length/width 1.46-1.94 (1.89); anterior venter/genital field length 1.28-1.41 (1.34); anterior venter length/genital field width 1.70-1.93 (1.83); anterior venter/medial suture 2.43-2.79 (2.70).

IMMATURES unknown.

Etymology. Specific epithet (*sharkeyi*) named in honor of braconid systematist, Michael Sharkey, who advised JRF during his master's degree and solidified his lifelong passion for taxonomy.

Distribution. Southwestern, New Mexico and Arizona (Figure 234).

Remarks. Our analyses were unable to confidently place *Torrenticola sharkeyi* phylogenetically. The COI analyses recovers this species at the base of the Raptor Complex, but this relationship was not recovered in the combined analysis. Because of this ambiguity, we refrain from placing this species in a species complex. Furthermore, because of the unique morphology of this species, we refrain from placing this species in an identification group.

All specimens are less than 2% different in COI sequence from each other and greater than 16% different from sister species.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (greater than 3%), and by the morphological characters outlined in the diagnosis.

Torrenticola shubini isher & Dowling, sp. n. http://zoobank.org/160D26D4-7B82-4C2E-A02D-B7CFD114839B

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (3 \bigcirc ; 2 \circlearrowright) deposited in the CNC; other paratypes (2 \bigcirc ; 2 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola shubini are similar to other members of the Rusetria "4-Plates" group (T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, and T. rufoalba) and T. skvarlai in having anterio-lateral platelets free from the dorsal plate, dorsal coloration separated into anterior and posterior portions, and indistinct hind coxal margins. Female T. shubini can be differentiated from female T. dunni by having a thinner rostrum (length/width = 2.5-2.7 in T. shubini, 2.8-3.0 in T. dunni). Male T. dunni can be differentiated from male *T. shubini* by having a longer anterior venter (215–238 in T. shubini, 277-285 in T. dunni). T. shubini can be differentiated from T. pollani by having stockier tibiae (length/width $\mathcal{Q} = 3.30-3.60$ in *T. shubini*, 3.89-4.18 in *T. pollani*; $\delta = 3.11 - 3.22$ in *T. shubini*, 3.41 - 3.75 in *T. pollani*) and a stockier rostrum (length/width = 2.24–2.92 in T. shubini, 3.27–3.82 in T. pollani). T. shubini can be differentiated from *T. glomerabilis* by having the Dgl-4 closer to the dorsal edge (dorsal width/length between Dgl-4 = 1.2–1.4 in *T. shubini*; 1.5–1.7 in *T. glomerabilis*); and stockier tibiae (length/width $\mathcal{Q} = 3.3-3.6$ in *T. shubini*, 4.1-4.5 in *T. glomerabilis*; ♂ = 3.1–3.2 in T. shubini, 3.5–4.4 in T. glomerabilis). Female T. shubini can be differentiated from female T. kittatinniana by having a stockier rostrum (length/width = 2.5–2.7 in T. shubini, 3.16 in T. kittatinniana) and a taller subcapitulum (140–145 in T. shubini, 125 in T. kittatinniana). Male T. shubini can be differentiated from male T. kittatinniana by having a shorter dorsum (400-465 in T. shubini, 500 in T. kittatinniana) and a shorter genital field (90-108 in T. shubini, 115 in T. kittatinniana). T. shubini can be differentiated from T. rufoalba by having a stockier rostrum (length/ width = 2.24-2.92 in T. shubini, 2.96-3.06 in T. rufoalba). Female T. shubini can be differentiated from female T. rufoalba by having a thinner genital field (137-145 in T. shubini, 157.5 in T. rufoalba). Male T. shubini can be differentiated from male T. rufoalba by having a longer anterior venter (215–238 in T. pollani, 195 in T. rufoalba). T. shubini can be differentiated from T. skvarlai by having a conical pedipalpal femoral tubercle, whereas *T. skvarlai* has a broad and flat pedipalpal femoral tubercle, and by

Figure 237. Torrenticola shubini sp. n. distribution.

having a longer anterior venter ($\bigcirc = 156-170$ in *T. shubini*, 140–153 in *T. skvarlai*; $\bigcirc = 215-238$ in *T. shubini*, 177–205 in *T. skvarlai*).

Description. FEMALE (Figure 238) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–640 (590) long; 415–455 (430) wide) ovoid with faint bluishpurple coloration separated into anterior and posterior portions, and with faint orange medially. Anterio-medial platelets (115–125 (122.5) long; 40–47.5 (46.25) wide). Anterio-lateral platelets (160–170 (165) long; 55–60 (56.25) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 310–335 (325)). Dorsal plate proportions: dorsum length/width 1.33–1.45 (1.37); dorsal width/distance between Dgl-4 1.32–1.42 (1.32); anteriomedial platelet length/width 2.63–2.88 (2.65); anterio-lateral platelet length/width 2.75–2.96 (2.93); anterio-lateral/anterio-medial length 1.28–1.43 (1.35).

Gnathosoma — **Subcapitulum** (300–320 (310) long (ventral); 223–255 (232) long (dorsal); 140–145 (140) tall) colorless. Rostrum (117.5–122.5 (120) long; 45–48.75 (45) wide). Chelicerae (288–320 (316) long) with curved fangs (54–63 (57) long). Subcapitular proportions: ventral length/height 2.14–2.21 (2.21); rostrum length/width 2.51–2.67 (2.67). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–47.5 (47.5) long); femur (112.5–121.25 (117.5) long); genu (63.75–70 (66.25) long); tibia (82.5–90 (83.75) long; 23.75–25 (25) wide); tarsus (17.5–17.5 (17.5) long). Palpomere proportions:

field length 0.94–1.05 (0.94); anterior venter length/genital field width 1.14–1.24; anterior venter/medial suture 7.50–21.00 (7.50).

MALE (Figure 239) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (400–465 (460) long; 260–305 (300) wide) ovoid with faint bluishpurple coloration separated into anterior and posterior portions, and with faint orange medially. Anterio-medial platelets (82.5–100 (92.5) long; 30–40 (35) wide). Anteriolateral platelets (115–135 (127.5) long; 35–47.5 (42.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 210–250 (250)). Dorsal plate proportions: dorsum length/width 1.52–1.57 (1.53); dorsal width/distance between Dgl-4 1.20–1.27 (1.20); anterio-medial platelet length/width 2.31–2.92 (2.64); anterio-lateral platelet length/width 2.84–3.29 (3.00); anterio-lateral/anterio-medial length 1.29–1.41 (1.38).

Gnathosoma — **Subcapitulum** (210–245 (240) long (ventral); 162.5–180 (171) long (dorsal); 78.75–87.5 (85) tall) colorless. Rostrum (87.5–95 (92.5) long; 30–42.5 (32.5) wide). Chelicerae (210–234 (229) long) with curved fangs (38–42.5 (40) long). Subcapitular proportions: ventral length/height 2.67–2.82 (2.82); rostrum length/ width 2.24–2.92 (2.85). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (32.5–37.5 (37.5) long); femur (82.5–91.25 (87.5) long); genu (50–55 (52.5) long); tibia (62.5–72.5 (70) long; 20–22.5 (22.5) wide); tarsus (15–16.25 (15) long). Palpomere proportions: femur/genu 1.62–1.75 (1.67); tibia/femur 0.76–0.83 (0.80); tibia length/width 3.11–3.22 (3.11).

Venter — (490–571 (571) long; 310–390 (342) wide) colorless. Gnathosomal bay (92.5–115 (115) long; 55–65 (65) wide). Cxgl-4 subapical. **Medial suture** (95–105 (95) long). **Genital plates** (90–107.5 (107.5) long; 75–80 (80) wide). Additional measurements: Cx-1 (200–235 (235) long (total); 96–121 (98) long (medial)); Cx-3 (235–293 (260) wide); anterior venter (215–237.5 (232.5) long). Ventral proportions: gnathosomal bay length/width 1.54–1.82 (1.77); anterior venter/genital field length 2.16–2.39 (2.16); anterior venter length/genital field width 2.84–3.07 (2.91); anterior venter/medial suture 2.05–2.45 (2.45).

IMMATURES unknown.

Etymology. Specific epithet (*shubini*) named in honor of author and palaeontologist Neil Shubin for his efforts to popularize stories of human evolution with his book (2009) and TV series (2014), *Your Inner Fish*. As with many of the species that Shubin studies (e.g., *Tiktaalik roseae* Daeschler, Shubin & Jenkins, 2006), *Torrenticola shubini* may represent a key evolutionary transition in the Rusetria Complex, between species that do and do not have their lateral platelets fused to the dorsal shield.

Distribution. Appalachians (Figure 237).

Remarks. *Torrenticola shubini* groups with other members of the Rusetria Complex with high support and specimens of this species are less than 2% different in COI sequence from each other. In all analyses, *T. shubini* groups with two other species with high support: *T. dunni* and *T. pollani. Torrenticola shubini* specimens are 5–12% different in COI sequence from these other species. The range of *T. shubini* overlaps with *T. dunni* in the southern Appalachians, but the ranges of these species do not overlap with *T. pollani.*

Based upon overall similarity, dorso-lateral platelet fusion, and distribution, we were able to place this species within the Eastern 4-Plate Identification Group

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola sierrensis (Marshall, 1943)

Atractides sierrensis Marshall, 1943: 307. *Atractides mercedensis* Marshall, 1943: 310. *Torrenticola sierrensis* Mitchell, 1954: 40.

Type deposition. Types $(1 \ Q; 1 \ d)$ deposited in the CNC.

Diagnosis. Torrenticola sierrensis are similar to other members of the Tricolor Complex (*T. bittikoferae*, *T. hoosieri*, *T. larvata*, *T. pearsoni*, *T. olliei*, *T. tricolor*, *T. trimaculata*, *T. unimaculata*, *T. cardia*, *T. kringi*, *T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. sierrensis* can be differentiated from most Tricolor Complex by being distributed in the west and having a wider genital field (Q = 180-213 in *T. sierrensis*, 145–180 in others; $\Im = 135-175$ in *T. sierrensis*, 92–120 in others), except for *T. olliei* (Q = 190-203, $\Im = 130-138$). *T. sierrensis* can be differentiated from *T. olliei* by having a more elongate rostrum (length/width = 1.95-2.14 in *T. sierrensis*, 1.56–1.81 in *T. olliei*).

Re-description. FEMALE (Figure 241) (n = 9) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (700–880 (865) long; 550–740 (710) wide) circular with orange or reddish purple coloration separated into anterior and posterior portions with faint orange medially (occasionally colorless). Anterio-medial platelets (162.5–197.5 (187.5) long; 65–82.5 (81.25) wide). Anterio-lateral platelets (192.5–250 (225) long; 82.5–

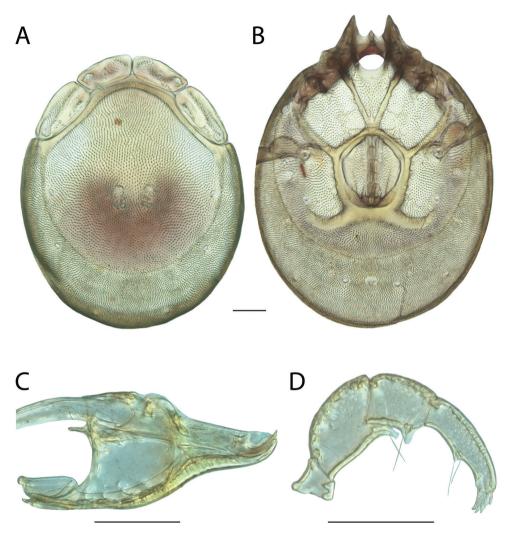

Figure 241. *Torrenticola sierrensis* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

100 (92.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 435–520 (500)). Dorsal plate proportions: dorsum length/width 1.19–1.27 (1.22); dorsal width/distance between Dgl-4 1.22–1.43 (1.42); anterio-medial platelet length/width 2.10–2.50 (2.31); anterio-lateral platelet length/width 2.33–2.50 (2.43); anterio-lateral/anterio-medial length 1.18–1.27 (1.20).

Gnathosoma — **Subcapitulum** 320–365 (365) long (ventral); 227–265 (260) long (dorsal); 140–165 (152.5) tall) colorless. Rostrum (120–140 (140) long; 60–70 (70) wide) short and conical. Chelicerae (320–355 long) with curved fangs (61–77.5 long). Subcapitular proportions: ventral length/height 2.19–2.39 (2.39); rostrum

length/width 1.96–2.08 (2.00). **Pedipalps** with tuberculate ventral extensions with dentate tips on femora and genua. Palpomeres: trochanter (45–55 (55) long); femur (115–135 (135) long); genu (80–92.5 (92.5) long); tibia (107.5–117.5 (117.5) long; 32.5-35 (35) wide); tarsus (21.25–35 32.5) long). Palpomere proportions: femur/genu 1.35–1.55 (1.46); tibia/femur 0.86–0.95 (0.87); tibia length/width 3.07–3.48 (3.36).

Venter — (775–1040 (1015) long; 619–820 (770) wide) colorless. Gnathosomal bay (155–205 (195) long; 95–112.5 (112.5) wide). Cxgl-4 subapical. **Medial suture** (17.5–37.5 (22.5) long). **Genital plates** (210–235 (222.5) long; 180–212.5 (212.5) wide). Additional measurements: Cx-1 (192.5–370 (370) long (total); 136– 185 (172.5) long (medial)); Cx-3 (250–475 (475) wide); anterior venter (192.5–237.5 (212.5) long). Ventral proportions: gnathosomal bay length/width 1.50–1.91 (1.73); anterior venter/genital field length 0.90–1.06 (0.96); anterior venter length/genital field width 1.00–1.13 (1.00); anterior venter/medial suture 6.33–12.14 (9.44).

MALE (Figure 242) (n = 7) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (590–735 (715) long; 460–590 (580) wide) circular with orange or reddish purple coloration separated into anterior and posterior portions with faint orange medially (occasionally colorless). Anterio-medial platelets (137.5–172.5 (172.5) long; 60–75 (75) wide). Anterio-lateral platelets (185–222.5 (215) long; 72.5–95 (92.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 355–460 (460)). Dorsal plate proportions: dorsum length/width 1.17–1.28 (1.23); dorsal width/distance between Dgl-4 1.26–1.33 (1.26); anterio-medial platelet length/width 2.24–2.48 (2.30); anterio-lateral platelet length/width 2.12–2.55 (2.32); anterio-lateral/anterio-medial length 1.22–1.38 (1.25).

Gnathosoma — **Subcapitulum** (270–330 (325) long (ventral); 200–235 (235) long (dorsal); 118.75–140 (135) tall) colorless. Rostrum (100–122.5 (122.5) long; 50–60 (60) wide) short and conical. Chelicerae (262–317.5 (315) long) with curved fangs (50–67.5 (60) long). Subcapitular proportions: ventral length/height 2.23–2.46 (2.41); rostrum length/width 1.95–2.14 (2.04). Pedipalps with tuberculate ventral extensions with dentate tips on femora and genua. Palpomeres: trochanter (40–50 (50) long); femur (92.5–120 (120) long); genu (65–80 (78.75) long); tibia (82.5–107.5 (102.5) long; 27.5–32.5 (32.5) wide); tarsus (25–32.5 (32.5) long). Palpomere proportions: femur/genu 1.42–1.52 (1.52); tibia/femur 0.85–0.95 (0.85); tibia length/width 3.00–3.31 (3.15).

Venter — (690–895 (875) long; 538–667 (665) wide) colorless. Gnathosomal bay (112.5–180 (175) long; 80–100 (92.5) wide). Cxgl-4 subapical. **Medial suture** (72.5–92.5 (90) long). **Genital plates** (172.5–220 (217.5) long; 135–175 (175) wide). Additional measurements: Cx-1 (269–360 (360) long (total); 137–182.5 (182.5) long (medial)); Cx-3 (364–455 (455) wide); anterior venter (255–295 (290) long). Ventral proportions: gnathosomal bay length/width 1.41–1.89 (1.89); anterior venter/genital field length 1.32–1.51 (1.33); anterior venter length/genital field width 1.66–1.89 (1.66); anterior venter/medial suture 3.03–3.59 (3.22).

IMMATURES unknown.

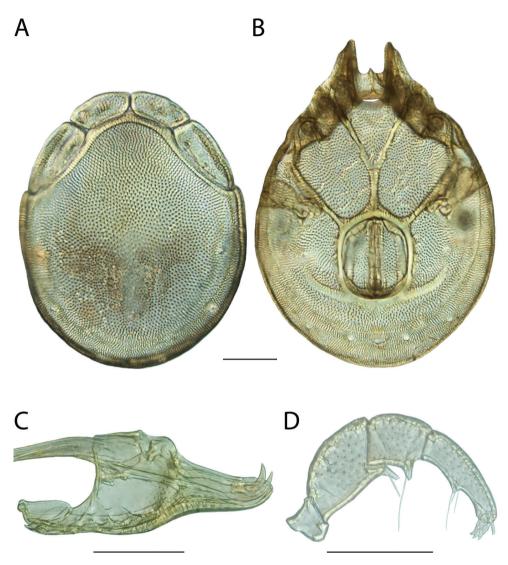

Figure 242. *Torrenticola sierrensis* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Etymology. Although Marshall (1943) did not specify an etymology for the specific epithet (*sierrensis*), surely it refers to the type locality of this species within the Sierra Nevada in California.

Distribution. Western (Figure 240), but likely not found in the southwest. *T. sierrensis* was previously known only from a few localities in California; we extend the range in western North America, but not in the southwest.

Remarks. Torrenticola sierrensis group with other members of the Tricolor Complex with high support in all analyses and group with *T. olliei* to form the western

portion of this complex. Specimens within this complex are 0-4.5% different in COI sequence from each other and greater than 6% different from *T. olliei*. This is higher sequence variability in COI than in most species hypotheses presented herein. However, given the topology in the COI tree (Figure 10) and morphological similarity, it seems apparent that the variability represents a continuum across a large distribution, rather than isolated species. This species hypothesis is supported by phylogenetic affinity and by the morphological characters outlined in the diagnosis.

Upon examining the types of *T. sierrensis* and *T. mercedensis* (Marshall, 1943), all characters for both species overlap with members of only one clade in our analyses. Therefore, it is apparent that these represent the same species hypothesis and must be synonymized. As First Revisers (ICZN Article 24.2), we select "*sierrensis*" as the senior synonym over "*mercedensis*" due to its broader range implication ("*mercedensis*" refers to the Merced River), even though *T. sierrensis* is distributed more widely than just the Sierra Nevada ranges.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and other paratypes (12 \bigcirc ; 18 \circlearrowright) deposited in the CNC; other paratypes (5 \bigcirc ; 5 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola skvarlai are similar to species with similar dorsal patterning, such as the Rusetria "4-Plate" group (*T. dunni, T. glomerabilis, T. kittatinniana, T. pollani, T. rufoalba*, and *T. shubini*), Elongata Group (*T. elongata, T. gorti*, and *T. reduncarostra*), Neoanomala Group (*T. interiorensis* and *T. neoanomala*), *T. bondi, T.* *racupalpa, T. irapalpa, T. erectirostra*, and *T. arktonyx*. They can be differentiated from all of these except Rusetria 4-Plates by having indistinct hind coxal margins. *T. skvarlai* can be differentiated from all Rusetria 4-Plates by having broadly tuberculate, dentate pedipalp femoral extensions (all Rusetria Complex have conical tuberculate pedipalp femoral extensions, usually without dentation) and by having a shorter anterior venter (Q = 140-152.5 in *T. skvarlai*, 155–213 in Rusetria 4-Plates; $\mathcal{J} = 177-205$ in *T. skvarlai*, 215–285 in Rusetria 4-Plates).

Description. FEMALE (Figure 244) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (495–560 (495) long; 370–420 (370) wide) ovoid with reddish-purple or bluish-purple coloration separated into anterior and posterior portions, occasionally with orange medially. Anterio-medial platelets (107.5–117.5 (107.5) long; 42.5–47.5 (42.5) wide). Anterio-lateral platelets (155–167.5 (155) long; 52.5–62.5 (52.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 245–285 (255)). Dorsal plate proportions: dorsum length/ width 1.33–1.39 (1.34); dorsal width/distance between Dgl-4 1.45–1.58 (1.45); anterio-medial platelet length/width 2.37–2.53 (2.53); anterio-lateral platelet length/ width 2.68–2.95 (2.95); anterio-lateral/anterio-medial length 1.36–1.44 (1.44).

Gnathosoma — **Subcapitulum** (290–315 (290) long (ventral); 218–240 (219) long (dorsal); 120–135 (120) tall) colorless. Rostrum (115–130 (115) long; 40–47.5 (40) wide). Chelicerae (286.75–321 (299) long) with curved fangs (49–65 (54) long). Subcapitular proportions: ventral length/height 2.33–2.48 (2.42); rostrum length/width 2.74–2.94 (2.88). **Pedipalps** with broadly tuberculate, dentate ventral extensions on femora and tuberculate ventral extensions on genua. Palpomeres: trochanter (37.5–45 (40) long); femur (105–119 (105) long); genu (62.5–67.5 (62.5) long); tibia (82.5–90 (82.5) long; 22.5–25 (22.5) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.67–1.76 (1.68); tibia/femur 0.76–0.79 (0.79); tibia length/width 3.50–3.78 (3.67).

Venter — (600–690 (600) long; 435–480 (435) wide) with faint reddish-purple or bluish-purple coloration. Gnathosomal bay (125–165 (135) long; 85–105 (85) wide). Cxgl-4 subapical. **Medial suture** (12.5–15 (12.5) long). **Genital plates** (165–172.5 (166.25) long; 150–152.5 (150) wide). Additional measurements: Cx-1 (243–285 (257) long (total); 109–120 (109) long (medial)); Cx-3 (295–345 (300) wide); anterior venter (140–152.5 (145) long). Ventral proportions: gnathosomal bay length/width 1.47–1.71 (1.59); anterior venter/genital field length 0.84–0.92 (0.87); anterior venter length/genital field width 0.93–1.02 (0.97); anterior venter/medial suture 10.17–12.00 (11.60).

MALE (Figure 245) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (425–510 (450) long; 310–360 (325) wide) ovoid with reddish-purple or bluish-purple coloration separated into anterior and posterior portions, occasionally with orange medially. Anterio-medial platelets (95–102.5 (100) long; 38.75–47.5 (40) wide). Anterio-lateral platelets (142.5–177.5 (147.5) long; 45–57.5 (47.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (dis-

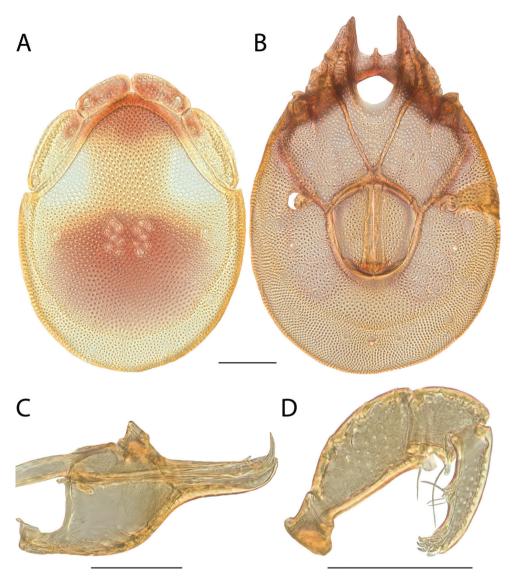

Figure 244. *Torrenticola skvarlai* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

tance between Dgl-4 220–240 (240)). Dorsal plate proportions: dorsum length/width 1.32–1.42 (1.38); dorsal width/distance between Dgl-4 1.35–1.50 (1.35); anteriomedial platelet length/width 2.16–2.50 (2.50); anterio-lateral platelet length/width 3.09–3.28 (3.11); anterio-lateral/anterio-medial length 1.48–1.73 (1.48).

Gnathosoma — **Subcapitulum** (245–290 (255) long (ventral); 177.5–220 (193) long (dorsal); 92.5–105 (97.5) tall) colorless. Rostrum (97.5–125 (102.5) long; 32.5–45 (35) wide). Chelicerae (235–280 (245) long) with curved fangs (47.5–55

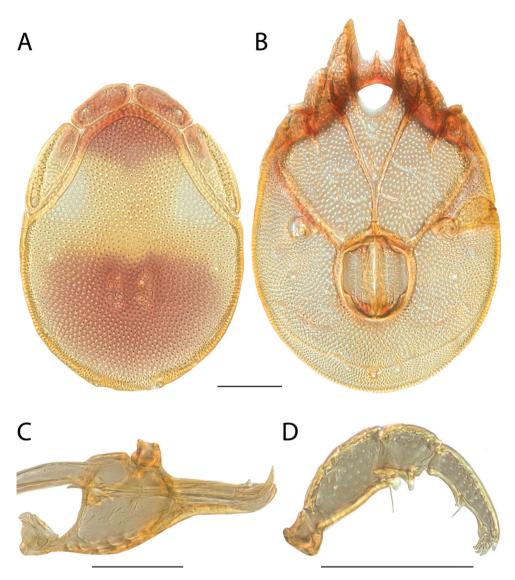

Figure 245. *Torrenticola skvarlai* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

(54) long). Subcapitular proportions: ventral length/height 2.62–2.76 (2.62); rostrum length/width 2.78–3.00 (2.93). **Pedipalps** with broadly tuberculate, dentate ventral extensions on femora and tuberculate ventral extensions on genua. Palpomeres: trochanter (30–40 (36.25) long); femur (87.5–105 (87.5) long); genu (50–60 (52.5) long); tibia (75–82.5 (78.75) long; 20–22.5 (21.25) wide); tarsus (15–18.75 (17.5) long). Palpomere proportions: femur/genu 1.67–1.80 (1.67); tibia/femur 0.79–0.90 (0.90); tibia length/width 3.65–3.88 (3.71). **Venter** — (530-620 (550) long; 358-415 (359) wide) with faint reddish-purple or bluish-purple coloration. Gnathosomal bay (130-145 (130) long; 62.5-75 (73.75)) wide). Cxgl-4 subapical. **Medial suture** (55-75 (75) long). **Genital plates** (120-135 (120) long; 100-110 (100) wide). Additional measurements: Cx-1 (225-280 (242) long (total); 100-135 (102) long (medial)); Cx-3 (270-320 (272) wide); anterior venter (177.5-205 (192.5) long). Ventral proportions: gnathosomal bay length/width 1.76-2.16 (1.76); anterior venter/genital field length 1.48-1.63 (1.60); anterior venter length/ genital field width 1.78-1.95 (1.93); anterior venter/medial suture 2.57-3.23 (2.57).

IMMATURES unknown.

Etymology. Specific epithet (*skvarlai*) named in honor of Michael Skvarla, who collected specimens of the species and is a dear friend and colleague of JRF.

Distribution. Appalachians (Figure 243).

Remarks. *Torrenticola skvarlai* groups with other members of the Raptor Complex with high support and specimens are less than 2% different in COI sequence from each other and greater than 9% from sister species. Placement of this species varied with analysis and was never well-supported. Furthermore, this species is not readily identifiable without keying, which does not warrant placement within an identification group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola solisorta Fisher & Dowling, sp. n. http://zoobank.org/FDDDB599-3669-430E-B96E-09567B324EA4

Material examined. HOLOTYPE (\mathcal{Q}): from USA, Arkansas, Polk County, East Saline Creek, beside Forest Road 38, north of Shady Lake Recreation Area, 30 Jul 2011, by IM Smith, IMS 110041, DNA 1300.

PARATYPES (4 \bigcirc ; 6 \circlearrowright): **Arkansas, USA**: 2 \circlearrowright from Montgomery County, Gaston, South Fork Ouachita River, 29 Jul 2011, by IM Smith, IMS110040 • 1 \circlearrowright (AL-LOTYPE) from Montgomery County, Ouachita National Forest, South Fork Ouachita River, 29 Jul 2011, by AJ Radwell, & B Crump, AJR110302 • 4 \bigcirc and 3 \circlearrowright from Polk County, East Saline Creek, beside Forest Road 38, north of Shady Lake Recreation Area, 30 Jul 2011, by IM Smith, IMS 110041.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and most paratypes $(2 \bigcirc; 4 \circlearrowright)$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \circlearrowright)$ deposited in ACUA.

Diagnosis. Torrenticola solisorta are similar to other members of the Nigroalba Group (*T. flangipalpa*, *T. nigroalba*, and *T. dentirostra*) in being small, slightly elongate, having purple dorsal coloration restricted posteriorly, and having distinct yet poorly-defined hind coxal margins. *T. solisorta* can be differentiated from *T. flangipalpa* by having tuberculate pedipalp femoral extension (flange-like and anteriorly-directed in *T. flangipalpa*); a shorter anterior venter (192–225 in *T. solisorta*, 235–265 in *T.*

Figure 246. Torrenticola solisorta sp. n. distribution.

flangipalpa); and more elongate pedipalp tibia (length/ width $\mathcal{Q} = 5.67-5.82$ in T. solisorta, 4.79-5.00 in T. flangipalpa; 3 = 5.08-5.17 in T. solisorta, 4.40-4.86 in T. flangipalpa). T. solisorta can be differentiated from T. dentirostra by having a smooth rostrum (*T. dentirostra* has a dentate bump midway on the dorsal edge of the rostrum) and more elongate pedipalpal tibiae (length/width Q = 5.6-5.9 in *T. solisorta*, 4.5-5.0 in T. dentirostra; \bigcirc = 5.0–5.2 in T. solisorta, 4.5–4.7 in T. dentirostra). T. solisorta can be differentiated from *T. nigroalba* by having orangish coloration immediately anterior to the purple dorsal coloration. Additionally, female T. solisorta can be differentiated from female T. nigroalba by having a slightly shorter dorsum (475-500 in T. solisorta, 500-530 in *T. nigroalba*); a thicker gnathosomal bay (length/width = 1.3-1.5 in *T.* solisorta, 1.25–1.55 in T. nigroalba); and a slightly thinner subcapitulum (3.14–3.30 in T. solisorta, 3.00-3.14 in T. nigroalba). Male T. solisorta also can be differentiated from T. nigroalba by anterior venter/medial suture (2.87-3.26 in T. solisorta, 2.54-2.77 in T. nigroalba) and having a wider dorsum (305-320 in T. solisorta, 290-300 in T. nigroalba). Other Torrenticola with purple dorsal coloration restricted posteriorly can be confused with T. solisorta, such as T. tahoei and T. oregonensis. Both of these species are larger (dorsum length Q = 475-500 in *T. solisorta*, 600-840 in others; $\mathcal{J} = 425-460$ in T. solisorta, 560-820 in others) and distributed in the west (T. solisorta is known only from the Ouachita Mountains in Arkansas).

Description. FEMALE (Figure 247) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

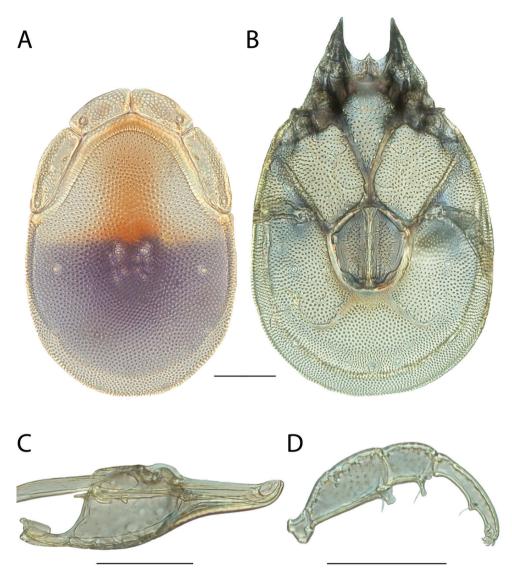

Figure 247. *Torrenticola solisorta* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Dorsum — (475–500 (500) long; 325–360 (350) wide) ovoid with bluish-purple to purple coloration restricted posteriorly with orange immediately anterior and fading anteriorly. Anterio-medial platelets (102.5–112.5 (112.5) long; 42.5–46.25 (45) wide). Anterio-lateral platelets (138.75–150 (147.5) long; 47.5–50 (47.5) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 220–240 (240)). Dorsal plate proportions: dorsum length/width 1.38–1.46 (1.43); dorsal width/distance between Dgl-4 1.45–1.50 (1.46); anteriomedial platelet length/width 2.22–2.53 (2.50); anterio-lateral platelet length/width 2.78–3.16 (3.11); anterio-lateral/anterio-medial length 1.31–1.43 (1.31).

Gnathosoma — **Subcapitulum** (280–300 (300) long (ventral); 199–217 (217) long (dorsal); 85–92.5 (92.5) tall) elongate and colorless. Rostrum (105–110 (110) long; 35–37.5 (36.25) wide). Chelicerae (256–281 (278) long) with curved fangs (34–44 (43) long). Subcapitular proportions: ventral length/height 3.14–3.29 (3.24); rostrum length/width 2.87–3.03 (3.03). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua ending broadly and dentate. Palpomeres: trochanter (27.5–30 (30) long); femur (86.25–93.75 (93.75) long); genu (52.5–55 (55) long); tibia (80–85 (85) long; 13.75–15 (15) wide); tarsus (12.5–15 (12.5) long). Palpomere proportions: femur/genu 1.64–1.70 (1.70); tibia/femur 0.91–0.99 (0.91); tibia length/width 5.67–5.82 (5.67).

Venter — (580–640 (630) long; 356–439 (380) wide) with bluish-purple or purple coloration. Gnathosomal bay (97.5–110 (110) long; 70–77.5 (77.5) wide). Cxgl-4 far from apex. **Medial suture** (47.5–50 (47.5) long). **Genital plates** (132.5–140 (140) long; 117.5–122.5 (122.5) wide). Additional measurements: Cx-1 (228–249 (249) long (total); 88–121 (121) long (medial)); Cx-3 (236.5–259.75 (252) wide); anterior venter (192.5–207.5 (205) long). Ventral proportions: gnathosomal bay length/width 1.30–1.50 (1.42); anterior venter/genital field length 1.45–1.54 (1.46); anterior venter length/ genital field width 1.60–1.77 (1.67); anterior venter/medial suture 3.85–4.37 (4.32).

MALE (Figure 248) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (425–460 (435) long; 305–320 (305) wide) ovoid with bluish-purple to purple coloration restricted posteriorly with orange immediately anterior and fading anteriorly. Anterio-medial platelets (97.5–105 (100) long; 40–45 (42.5) wide). Anterio-lateral platelets (130–145 (145) long; 45–50 (45) wide) free from dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 205–220 (215)). Dorsal plate proportions: dorsum length/width 1.37–1.48 (1.43); dorsal width/distance between Dgl-4 1.42–1.51 (1.42); anterio-medial platelet length/width 2.33–2.44 (2.35); anterio-lateral platelet length/width 2.85–3.22 (3.22); anterio-lateral/anterio-medial length 1.32–1.45 (1.45).

Gnathosoma — **Subcapitulum** (252.5–265 (255) long (ventral); 181–196 (190) long (dorsal); 80–87.5 (80) tall) elongate and colorless. Rostrum (92.5–100 (100) long; 32.5–35 (35) wide). Chelicerae (240–246 (240) long) with curved fangs (33–45 (45) long). Subcapitular proportions: ventral length/height 2.97–3.19 (3.19); rostrum length/width 2.81–2.92 (2.86). **Pedipalps** elongate (especially tibiae) with tuberculate ventral extensions on femora and genua ending broadly and dentate. Palpomeres: trochanter (27.5–30 (27.5) long); femur (80–82.5 (80) long); genu (48.75–51.25 (48.75) long); tibia (77.5–82.5 (77.5) long; 15–16.25 (15) wide); tarsus (12.5–15 (12.5) long). Palpomere proportions: femur/genu 1.59–1.65 (1.64); tibia/femur 0.94–1.00 (0.97); tibia length/width 5.08–5.17 (5.17).

Venter — (520–570 (545) long; 335–382 (335) wide) with bluish-purple or purple coloration. Gnathosomal bay (85–107.5 (102.5) long; 60–72.5 (67.5) wide).

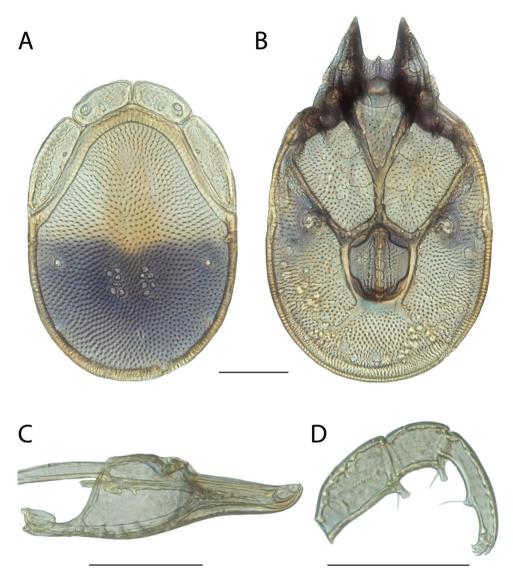

Figure 248. *Torrenticola solisorta* sp. n. male: **A** dorsal plates, note the faint orange coloration, which is a rare character state (most specimens are much brighter), not a male character **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Cxgl-4 far from apex. **Medial suture** (65-77.5 (75) long). **Genital plates** (105-115 (105) long; 90-95 (92.5) wide). Additional measurements: Cx-1 (208–231 (230) long (total); 91–130 (130) long (medial)); Cx-3 (240–281 (240) wide); anterior venter (210–225 (215) long). Ventral proportions: gnathosomal bay length/width 1.17–1.52 (1.52); anterior venter/genital field length 1.87–2.10 (2.05); anterior venter length/ genital field width 2.27–2.50 (2.32); anterior venter/medial suture 2.87–3.26 (2.87).

IMMATURES unknown.

Etymology. Specific epithet (*solisorta*) refers to the dorsal coloration of this species, which is the easiest way to differentiate it from its sister species (*T. nigroalba*). If one imagines the posterior purple color as the landscape and horizon, then the orangish coloration resembles the sun beginning to rise (*solis ortus*, L. sunrise).

Distribution. Ouachita Mountains (Figure 246).

Remarks. Torrenticola solisorta groups with other members of the Raptor Complex with high support in all analyses and specimens are less than 1% different in COI sequence from each other. In all analyses, *T. solisorta* groups with two other morphologically similar species: *T. flangipalpa* and *T. nigroalba*. Torrenticola solisorta is greater than 4% different in COI from its sister species (*T. nigroalba*). That clade of three species corresponds to an identification group, the Nigroalba Group, the members of which are easily differentiated by their size, coloration, long medial suture in females, and overall appearance.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Type deposition. Holotype (\bigcirc) and allotype (O) deposited in the CNC.

Diagnosis. Torrenticola tahoei are similar to the other member of Tahoei group, *T. oregonensis* by subcapitulum shape, having purple coloration restricted posteriorly and being distributed in the west and to members of the Nigroalba Group (*T. flangipalpa, T. nigroalba, T. solisorta,* and *T. dentirostra*) in having purple dorsal coloration restricted posteriorly. *T. tahoei* can be differentiated from the Nigroalba Group by being larger (dorsum length Q = 600-720 in *T. tahoei,* 475–565 in Nigroalba Group; $\mathcal{J} = 560-650$ in *T. tahoei,* 425–510 in Nigroalba Group) and distributed in the west (Nigroalba Group are eastern). *T. tahoei* can be differentiated from *T. oregonensis* by being smaller (dorsum length Q = 600-720 in *T. tahoei,* 760–840 in *T. oregonensis*, $\mathcal{J} = 560-650$ in *T. tahoei,* 690–820 in *T. oregonensis*; dorsum width Q = 430-515 in *T. tahoei,* 560–640 in *T. oregonensis;* $\mathcal{J} = 400-460$ in *T. tahoei,* 520–605 in *T. oregonensis*) and a more elongate subcapitulum (ventral length/width = 3.25–4.11 in *T. tahoei,* 2.63–2.74 in *T. oregonensis*).

Re-description. FEMALE (Figure 250) (n = 7) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (600–720 (640) long; 430–515 (515) wide) ovoid with purple coloration restricted posteriorly. Anterio-medial platelets (115–140 (132.5) long; 62.5–77.5 (72.5) wide). Anterio-lateral platelets (177.5–202.5 (192.5) long; 65–85 (75) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 335–400 (380)). Dorsal plate proportions: dorsum length/width 1.24–1.44 (1.24); dorsal width/distance between Dgl-4 1.25–1.43 (1.36); anterio-medial platelet length/width 1.68–1.96 (1.83); anterio-lateral platelet length/width 2.31–2.76 (2.57); anterio-lateral/anterio-medial length 1.40–1.57 (1.45).

Gnathosoma — **Subcapitulum** (345–390 (390) long (ventral); 266–315 (315) long (dorsal); 95–110 (95) tall) elongate and colorless. Rostrum (142.5–157.5 (157.5) long; 40–47.5 (45) wide) elongate. Chelicerae (358–395 (395) long) with curved fangs (50–56 (52.5) long). Subcapitular proportions: ventral length/height 3.41–4.11 (4.11); rostrum length/width 3.11–3.81 (3.50). Pedipalps elongate (especially tibiae) with broad, flat, dentate, and anteriorly-directed ventral extensions on femora and broadly tuberculate, dentate ventral extensions on genua. Palpomeres: trochanter (32.5–40 long); femur (102.5–117.5 long); genu (72.5–85 long); tibia (87.5–97.5 long; 21.25–25 wide); tarsus (15–17.5 long). Palpomere proportions: femur/genu 1.38–1.52; tibia/femur 0.82–0.86; tibia length/width 3.89–4.22.

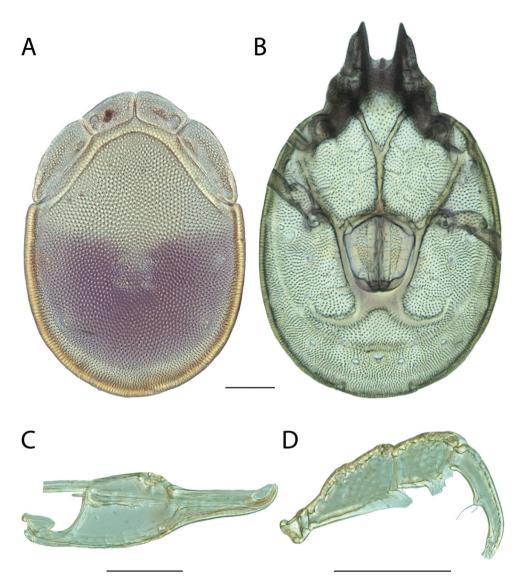

Figure 250. *Torrenticola tahoei* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Venter — (770–850 (810) long; 466–565 (565) wide) mostly colorless with areas of purple coloration. Gnathosomal bay (95–112.5 (100) long; 65–80 (70) wide). Cxgl-4 far from apex. **Medial suture** (95–130 (122.5) long). **Genital plates** (160–172.5 (166.25) long; 145–160 (160) wide). Additional measurements: Cx-1 (266–301 (290) long (total); 159–195 (190) long (medial)); Cx-3 (297–340 (335) wide); anterior venter (285–322.5 (312.5) long) elongate. Ventral proportions: gnathosomal bay length/

width 1.19–1.59 (1.43); anterior venter/genital field length 1.70–1.88 (1.88); anterior venter length/genital field width 1.84–2.08 (1.95); anterior venter/medial suture 2.37–3.11 (2.55).

MALE (Figure 251) (n = 5) with characters of the genus with following specifications.

Dorsum — (560–650 long; 400–460 wide) ovoid with purple coloration restricted posteriorly. Anterio-medial platelets (112.5–125 long; 57.5–67.5 wide). Anteriolateral platelets (163.75–200 long; 65–80 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 300–370). Dorsal plate proportions: dorsum length/width 1.30–1.41; dorsal width/ distance between Dgl-4 1.24–1.33; anterio-medial platelet length/width 1.70–1.96; anterio-lateral platelet length/width 2.38–2.71; anterio-lateral/anterio-medial length 1.44–1.65.

Gnathosoma — **Subcapitulum** (325–347.5 long (ventral); 244–268 long (dorsal); 92.5–106.25 tall) elongate and colorless. Rostrum (130–140 long; 40–45 wide) elongate. Chelicerae (320–353 long) with curved fangs (41–56 long). Subcapitular proportions: ventral length/height 3.25–3.57; rostrum length/width 3.06–3.31. **Pedipalps** elongate (especially tibia) with broad, flat, dentate, and anteriorly-directed ventral extensions on femora and broadly tuberculate, dentate ventral extensions on genua. Palpomeres: trochanter (35–37.5 long); femur (100–107.5 long); genu (67.5–75 long); tibia (82.5–92.5 long; 20–23.75 wide); tarsus (12.5–17.5 long). Palpomere proportions: femur/genu 1.43–1.48; tibia/femur 0.80–0.88; tibia length/ width 3.67–4.13.

Venter — (720–790 long; 450–517 wide) mostly colorless with areas of purple coloration. Gnathosomal bay (95–105 long; 65–77.5 wide). Cxgl-4 far from apex. **Medial suture** (120–147.5 long). **Genital plates** (132.5–142.5 long; 110–122.5 wide). Additional measurements: Cx-1 (232–264 long (total); 138–183 long (medial)); Cx-3 (285–315 wide); anterior venter (305–325 long) elongate. Ventral proportions: gnathosomal bay length/width 1.27–1.54; anterior venter/genital field length 2.21–2.34; anterior venter length/genital field width 2.57–2.82; anterior venter/medial suture 2.18–2.54.

IMMATURES unknown.

Etymology. Marshall (1943) did not specify an etymology for this specific epithet (*tahoei*). It surely refers to the collection locality of the paratype, Taylor's Creek near Lake Tahoe, California, although the holotype was collected from Waddell Creek near the coast.

Distribution. Western, but not known from the southwest (Figure 249). *T. tahoei* was originally reported only from a few localities in California; we expand its known range into Oregon and Washington, and the Rocky Mountains.

Remarks. *Torrenticola tahoei* groups with members of the Miniforma Complex with high support in all analyses. There is considerable genetic variability within this species (0–3.8%), particularly between specimens from California and those from elsewhere. However, we find no morphological characters to support California speci-

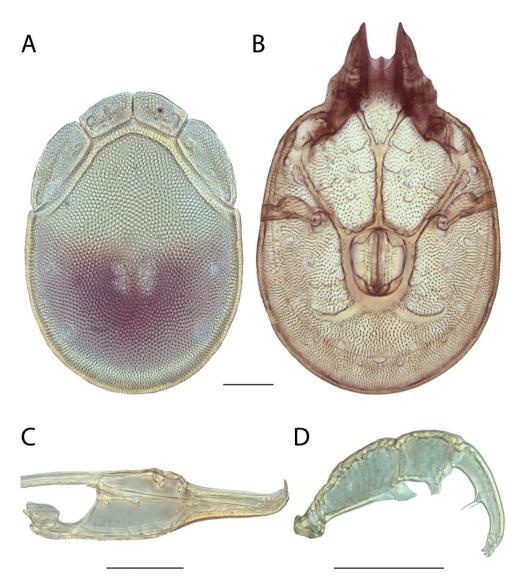

Figure 251. *Torrenticola tahoei* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

mens being recognized as a separate species, so we consider them all one widely distributed species.

This species is so distinct and recognizable from all other species that we do not place it within an identification group. It is greater than 11.6% different in COI sequence from other members of the Miniforma group.

This species hypothesis is supported by high divergence between species (3–15%) and by the morphological characters outlined in the diagnosis.

Torrenticola tricolor Habeeb, 1957

Type deposition. Holotype (\bigcirc) and allotype (\circlearrowleft) deposited in the CNC.

Diagnosis. Torrenticola tricolor are similar to other members of the Tricolor Complex (*T. bittikoferae, T. hoosieri, T. larvata, T. pearsoni, T. olliei, T. sierrensis, T. trimaculata, T. unimaculata, T. cardia, T. kringi, T. dimorpha*, and *T. mohawk*) in having a short, conical rostrum. *T. tricolor* can be differentiated from all *Torrenticola*, including other members of the Tricolor Complex, by having a distinct dorsal pattern. Although the spots always have this basic construction, there is great variability between specimens.

Figure 252. Torrenticola tricolor distribution.

T. tricolor are most similar to other members of the Tricolor Complex that have bold patterning (T. larvata, T. unimaculata, T. trimaculata, cardia, kringi, and T. mohawk). T. tricolor can be further differentiated from T. larvata by being rounder (dorsum length/width = 1.2–1.38 in T. tricolor, 1.41–1.57 in T. larvata) and stockier pedipalp tibiae (length/width $\mathcal{Q} = 3.0-3.11$ in *T. tricolor*, 3.25–3.5 in *T. larvata*; $\mathcal{J} = 2.7-2.8$ in T. tricolor, 3.1–3.2 in T. larvata). T. tricolor can be further differentiated from T. tri*maculata* by having longer genital field (Q = 187.5-210 in *T. tricolor*, 157.5-185 in *T. trimaculata*; $\mathcal{J} = 145-170$ in *T. tricolor*, 120–140 in *T. trimaculata*) and a slightly more elongate rostrum (length/width Q = 2.14-2.39 in *T. tricolor*, 1.91-2.1 in *T. trimaculata*; \bigcirc = 2.37–2.5 in *T. tricolor*, 2.05–2.22 in *T. trimaculata*). *T. tricolor* can be further differentiated from *T. unimaculata* by having stockier pedipalp tibiae ($\mathcal{Q} = 3.0-3.11$ in *T. tricolor*, 3.2–3.4 in *T. unimaculata*; $\mathcal{J} = 2.69-2.8$ in *T. tricolor*, 2.9–3.11 in *T.* unimaculata) and shorter medial suture in females (15-22.5 in T. tricolor, 40-47.5 in T. unimaculata). T. tricolor can be further differentiated from T. cardia by having a rounder dorsum (length/width = 1.2-1.38 in T. tricolor, 1.39-1.54 in T. cardia) and longer pedipalpal genua (75-83 in T. tricolor, 60-70 in T. cardia). T. tricolor can be further differentiated from *T. kringi* by having a stockier rostrum (length/width = 2.14-2.50 in T. tricolor, 2.67-3.13 in T. kringi). T. tricolor can be differentiated from *T. mohawk* by having a more elongate rostrum (length/width $\mathcal{Q} = 2.14-2.39$ in *T. tricolor*, 1.80–2.00 in *T. mohawk*; $\mathcal{J} = 2.37-2.50$ in *T. tricolor*, 2.00–2.13 in *T. mohawk*).

Re-description. MALE (Figure 253) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (580–660 (640) long; 435–520 (520) wide) circular to ellipsoid with reddish-purple or bluish-purple to navy blue coloration in two large posterior spots and a smaller anterior spot all merged together, often with orange between the posterior spots. Anterio-medial platelets (120–137.5 (137.5) long; 62.5–70 (70) wide). Anterio-lateral platelets (175–207.5 (192.5) long; 72.5–95 (95) wide) free from dorsal plate. Dgl-4 usually closer to the edge of the dorsum than to the muscle scars, occasionally halfway between the dorsum edge and muscle scars (distance between Dgl-4 295–375 (325)). Dorsal plate proportions: dorsum length/width 1.23–1.38 (1.23); dorsal width/distance between Dgl-4 1.33–1.60 (1.60); anterio-medial platelet length/ width 1.92–2.00 (1.96); anterio-lateral platelet length/width 2.03–2.55 (2.03); anterio-lateral/anterio-medial length 1.40–1.58 (1.40).

Gnathosoma — **Subcapitulum** (247.5–295 (247.5) long (ventral); 197.5–226 (197.5) long (dorsal); 105–122.5 (112.5) tall) colorless. Rostrum (107.5–125 (107.5) long; 45–52.5 (45) wide) short and conical. Chelicerae (254–290 (260) long) with curved fangs (42–56 (52.5) long). Subcapitular proportions: ventral length/height 2.20–2.62 (2.20); rostrum length/width 2.37–2.50 (2.39). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–45 (37.5) long); femur (95–110 (95) long); genu (70–80 (75) long); tibia (76.25–90 (76.25) long; 28.75–32.5 (28.75) wide); tarsus (22.5–27.5 (22.5) long). Palpomere proportions: femur/genu 1.27–1.45 (1.27); tibia/femur 0.80–0.86 (0.80); tibia length/width 2.65–2.80 (2.65).

Venter — (720–804 (790) long; 448–660 (660) wide) colorless. Gnathosomal bay (110–145 (126.25) long; 75–97.5 (85) wide). Cxgl-4 subapical. **Medial suture** (105–137.5 (105) long). **Genital plates** (145–170 (157.5) long; 107.5–115 (107.5) wide). Additional measurements: Cx-1 (271–290.5 (280) long (total); 139–163 (150) long (medial)); Cx-3 (316–401 (382.5) wide); anterior venter (255–297.5 (262.5) long). Ventral proportions: gnathosomal bay length/width 1.33–1.61 (1.49); anterior venter/genital field length 1.67–1.92 (1.67); anterior venter length/genital field width 2.37–2.77 (2.44); anterior venter/medial suture 2.16–2.50 (2.50).

FEMALE (Figure 254) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (600–755 (610) long; 470–575 (510) wide) circular to ellipsoid with reddish-purple or bluish-purple to navy blue coloration in two large posterior spots and a smaller anterior spot all merged together, often with orange between the posterior spots. Anterio-medial platelets (135–148.75 (137.5) long; 66.25–75 (70) wide). Anterio-lateral platelets (195–207.5 (195) long; 82.5–100 (100) wide) free from dorsal plate. Dgl-4 usually closer to the edge of the dorsum than to the muscle scars, occasionally halfway between the dorsum edge and muscle scars (distance between Dgl-4 320–410 (320)). Dorsal plate proportions: dorsum length/width 1.20–1.35 (1.20); dorsal width/distance between Dgl-4 1.36–1.59 (1.59); anterio-medial platelet length/width 1.93–2.20 (1.96); anterio-lateral platelet length/width 1.95–2.52 (1.95); anterio-lateral/anterio-medial length 1.33–1.46 (1.42).

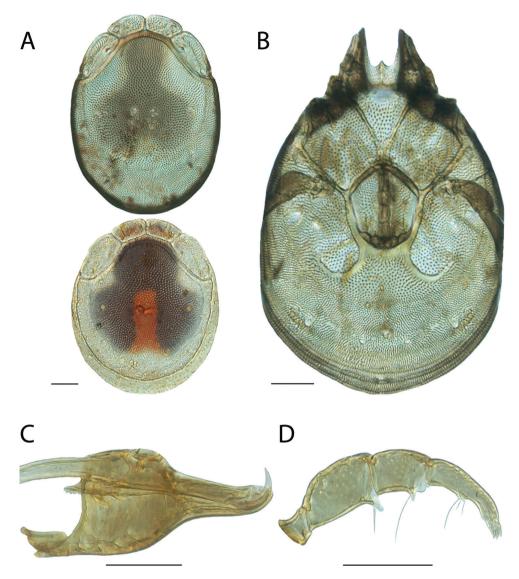

Figure 253. *Torrenticola tricolor* female: **A** dorsal plates, note color variation **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

Gnathosoma — **Subcapitulum** (285–330 (285) long (ventral); 210–251 (210) long (dorsal); 132.5–142.5 (132.5) tall) colorless. Rostrum (112.5–137.5 (112.5) long; 52.5–57.5 (52.5) wide) short and conical. Chelicerae (300–332 (300) long) with curved fangs (49–63 (52.5) long). Subcapitular proportions: ventral length/height 2.15–2.42 (2.15); rostrum length/width 2.14–2.39 (2.14). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–47.5 (42.5) long); femur (107.5–120 (107.5) long); genu (75–82.5 (75) long); tibia (90–105 (90)

long; 30–33.75 (30) wide); tarsus (22.5–27.5 (22.5) long). Palpomere proportions: femur/genu 1.41–1.48 (1.43); tibia/femur 0.84–0.89 (0.84); tibia length/width 3.00–3.11 (3.00).

Venter — (690–890 (740) long; 561–665 (665) wide) colorless. Gnathosomal bay (145–165 (145) long; 91.25–102.5 (91.25) wide). Cxgl-4 subapical. **Medial suture** (15–22.5 (20) long). **Genital plates** (187.5–210 (187.5) long; 155–171.25 (167.5) wide). Additional measurements: Cx-1 (265–311 (265) long (total); 125–151.75 (125) long (medial)); Cx-3 (375–433 (375) wide); anterior venter (152.5–192.5 (152.5)

long). Ventral proportions: gnathosomal bay length/width 1.53–1.70 (1.59); anterior venter/genital field length 0.81–0.95 (0.81); anterior venter length/genital field width 0.91–1.18 (0.91); anterior venter/medial suture 7.63–11.83 (7.63).

IMMATURES unknown.

Etymology. Although Habeeb (1957) did not specify an etymology for the specific epithet (*tricolor*), it surely refers to his comment on the dorsal coloration, "color black with some red and white" (*tres*, L. three; *color*, L. color).

Distribution. Northeastern and southward throughout the Appalachians (Figure 252). *T. tricolor* was previously known only from northern New Jersey.

Remarks. Torrenticola tricolor group with other members of the Tricolor Complex with high support and specimens of this species are less than 2.4% different in COI sequence from each other. This within-species sequence variability is higher than in many species hypotheses presented herein. However, given the topology in the COI tree (Figure 14) and morphological similarity, it seems apparent that the variability represents a continuum across a large distribution, rather than isolated species. In all analyses, *T. tricolor* group with two other species which also have dorsal spots: *T. trimaculata* and *T. unimaculata*. This clade represents some of the most distinctive of all *Torrenticola*. This species is greater than 7% different in COI from sister species.

This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Diagnosis. Torrenticola trimaculata are similar to other members of the Tricolor Complex (T. bittikoferae, T. hoosieri, T. larvata, T. pearsoni, T. olliei, T. sierrensis, T. tricolor, T. unimaculata, T. cardia, T. kringi, T. dimorpha, and T. mohawk) in having a short, conical rostrum. T. trimaculata can be differentiated from all Torrenticola, including other members of the Tricolor Complex, by having a distinct dorsal pattern. Individuals are reported in two distinct morphs primarily based upon ventral coloration. T. trimaculata are most similar to other members of the Tricolor Complex that have bold patterning (T. larvata, T. unimaculata, T. tricolor, T. cardia, T. kringi, and T. mohawk). T. trimaculata can be further differentiated from T. larvata by being rounder (dorsum length/width = 1.2-1.37 in T. trimaculata, 1.41-1.57 in T. larvata); Dgl-4 closer to the muscle scars (dorsal width/distance between Dgl-4 = 1.49–1.69 in T. trimaculata, 1.18–1.35 in T. larvata); and a stockier rostrum (length/width = 1.91–2.22 in T. trimaculata, 2.32–2.53 in T. larvata). T. trimaculata can be further differentiated from T tricolor by having shorter genital field ($\mathcal{Q} = 157.5 - 185$ in T. trimaculata, 187.5–210 in *T. tricolor*; $\mathcal{J} = 120-140$ in *T. trimaculata*, 145–170 in *T. tricolor*) and a stockier rostrum (length/width Q = 1.91-2.1 in *T. trimaculata*, 2.14–2.39 in *T. tricolor*; $\mathcal{J} = 2.05 - 2.22$ in *T. trimaculata*, 2.37 - 2.5 in *T. tricolor*). *T. trimaculata* can be further differentiated from T. unimaculata by Dgl-4 closer to the muscles scars (dorsal width/ distance between Dgl-4 = 1.49–1.69 in T. trimaculata, 1.23–1.41 in T. unimaculata) and females with shorter medial suture (Q = 17.5-27.5 in *T. trimaculata*, 40-47.5 in T. unimaculata). T. trimaculata can be further differentiated from T. cardia by having Dgl-4 further from the edge of the dorsum (dorsum width/distance between Dgl-4 = 1.5–1.7 in T. trimaculata, 1.15–1.4 in T. cardia) and having a stockier rostrum (length/ width Q = 1.191-2.10 in *T. trimaculata*, 2.24-2.50 in *T. cardia*; a = 2.05-2.22 in T. trimaculata, 2.27-2.47 in T. cardia). T. trimaculata can be differentiated from T. kringi by having a stockier rostrum (length/width = 1.9-2.3 in T. trimaculata, 2.6-3.2 in T. kringi). T. trimaculata can be differentiated from T. mohawk by having a shorter anterior venter (\mathcal{Q} = 157–180 in *T. trimaculata*, 187–200 in *T. mohawk*, \mathcal{J} = 230–260

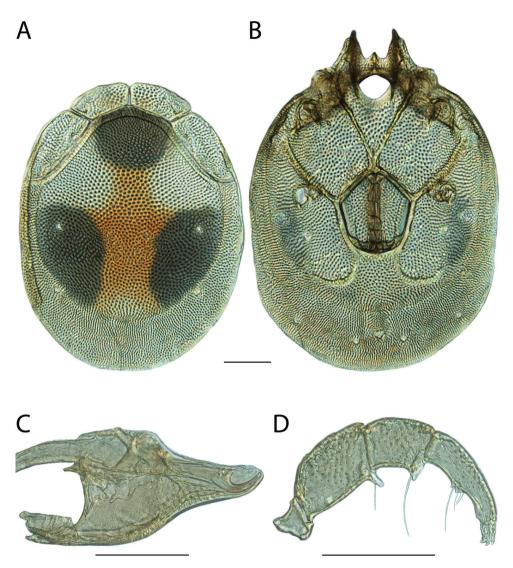

Figure 256. *Torrenticola trimaculata* female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

in *T. trimaculata*, 290–308 in *T. mohawk*). Additionally, female *T. trimaculata* can be differentiated from female *T. mohawk* by having longer pedipalpal tibiae (Q = 90-97 in *T. trimaculata*, 77–88 in *T. mohawk*).

Re-description (amended from Fisher et al. 2015). FEMALE (Figure 256) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (570–725 (725) long; 455–550 (550) wide) circular to ellipsoid with bluish-purple to navy blue coloration in three distinct spots, one anteriorly and two

posteriorly, and orange medially. Anterio-medial platelets (125–145 (145) long; 60–72.5 (67.5) wide). Anterio-lateral platelets (162.5–180 (180) long; 80–85 (82.5) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and the dorsum edge (distance between Dgl-4 295–335 (325)). Dorsal plate proportions: dorsum length/width 1.20–1.32 (1.32); dorsal width/distance between Dgl-4 1.49–1.69 1.69); anterio-medial platelet length/width 1.93–2.19 (2.15); anterio-lateral platelet length/ anterio-medial length 1.23–1.30 (1.24).

Gnathosoma — **Subcapitulum** (250–280 (280) long (ventral); 202–252 (210) long (dorsal); 115–135 (130) tall) colorless or with bluish-purple to navy blue coloration. Rostrum (97.5–110 (107.5) long; 47.5–55 (52.5) wide) short and conical. Chelicerae (261–326 (270) long) with curved fangs (48–62 (55) long). Subcapitular proportions: ventral length/height 2.04–2.17 (2.15); rostrum length/width 1.91–2.10 (2.05). Pedipalps with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–42.5 (42.5) long); femur (97.5–107.5 (103.75) long); genu (65–77.5 (70) long); tibia (90–96.25 (92.5) long; 27.5–30 (27.5) wide); tarsus (22.5–25 (22.5) long). Palpomere proportions: femur/genu 1.39–1.50 (1.48); tibia/femur 0.88–0.92 (0.89); tibia length/width 3.17–3.36 (3.36).

Venter — (615–840 (840) long; 533–700 (700) wide) colorless or with variable amount of bluish-purple to navy blue coloration. Gnathosomal bay (130–145 (130) long; 80–90 (80) wide). Cxgl-4 subapical. **Medial suture** (17.5–27.5 (20) long). **Genital plates** (157.5–185 (180) long; 152.5–185 (180) wide). Additional measurements: Cx-1 (258–306.75 (260) long (total); 109–154 (145) long (medial)); Cx-3 (328–390 (390) wide); anterior venter (157.5–180 (180) long). Ventral proportions: gnathosomal bay length/width 1.49–1.75 (1.63); anterior venter/genital field length 0.90–1.03 (1.00); anterior venter length/genital field width 1.00–1.14 (1.14); anterior venter/medial suture 6.09–9.29 (9.00).

MALE (Figure 257) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (530–595 (595) long; 390–440 (435) wide) circular to ellipsoid with bluish-purple to navy blue coloration in three distinct spots, one anteriorly and two posteriorly, and orange medially. Anterio-medial platelets (107.5–130 (120) long; 55–67.5 (62.5) wide). Anterio-lateral platelets (70–87.5 (75) long; 70–87.5 (75) wide) free from dorsal plate. Dgl-4 approaching midway between muscle scars and the dorsum edge (distance between Dgl-4 250–285 (270)). Dorsal plate proportions: dorsum length/width 1.30–1.37 (1.37); dorsal width/distance between Dgl-4 1.51–1.61 (1.61); anterio-medial platelet length/width 1.92–2.00 (1.92); anterio-lateral platelet length/width 1.91–2.23 (2.23); anterio-lateral/anterio-medial length 1.29–1.46 (1.40).

Gnathosoma — **Subcapitulum** (207.5–242.5 (230) long (ventral); 175–215 (194.75) long (dorsal); 92.5–112.5 (102.5) tall) colorless or with bluish-purple to navy blue coloration. Rostrum (87.5–100 (93.75) long; 40–47.5 (42.5) wide) short and conical. Chelicerae (232–286 (251) long) with curved fangs (40–53 (49) long). Subcapitular proportions: ventral length/height 2.16–2.43 (2.24); rostrum length/width 2.05–2.22 (2.21). Pedipalps with tuberculate ventral extensions on femora and genua.

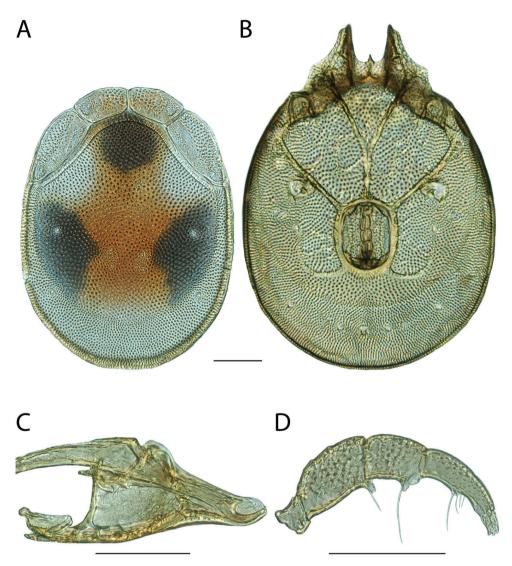

Figure 257. *Torrenticola trimaculata* male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Palpomeres: trochanter (32.5–40 (32.5) long); femur (85–95 (93.75) long); genu (60–70 (65) long); tibia (75–82.5 (75) long; 25–27.5 (27.5) wide); tarsus (20–25 (22.5) long). Palpomere proportions: femur/genu 1.34–1.44 (1.44); tibia/femur 0.80–0.88 (0.80); tibia length/width 2.73–3.00 (2.73).

Venter — (588–719 (715) long; 431–571 (568) wide) colorless or with variable amount of bluish-purple to navy blue coloration. Gnathosomal bay (82.5–112.5 (102.5) long; 62.5–77.5 (77.5) wide). Cxgl-4 subapical. **Medial suture** (87.5–105 (105) long). **Genital plates** (120–140 (127.5) long; 92.5–105 (95) wide). Addition-

al measurements: Cx-1 (216–297 (261) long (total); 130–168 (152) long (medial)); Cx-3 (287–372 (349) wide); anterior venter (230–260 (255) long). Ventral proportions: gnathosomal bay length/width 1.32–1.55 (1.32); anterior venter/genital field length 1.79–2.04 (2.00); anterior venter length/genital field width 92.5–105 (95); anterior venter/medial suture 2.43–2.63 (2.43).

IMMATURES unknown.

Etymology. Fisher et al. (2015) named the specific epithet (*trimaculata*) in reference to the dorsal coloration of three dark spots (*tres*, L. three; *macula*, L. spot).

Distribution. Eastern North America (Figure 255).

Remarks. Torrenticola trimaculata group with other members of the Tricolor Complex with high support in all analyses. All specimens of this species are less than 2% different in COI sequence from each other and are greater than 7% from sister species. In all analyses, *T. trimaculata* groups with two other species which also have dorsal spots: *T. tricolor* and *T. unimaculata*. This clade represents some of the most distinctive of all *Torrenticola*.

This species hypothesis is supported by low COI divergence within the species (0-2%), high divergence between species (3-15%), and the morphological characters outlined in the diagnosis.

Fisher et al. (2015) reported two color morphs based primarily upon presence of ventral coloration. Morph I, with a dark venter, was only known from the Interior Highlands and all eastern specimens were reported as Morph II, with a colorless venter. However, we examined additional specimens from across eastern North America and found colored individuals mixed within samples of uncolored individuals. We remain unsure what controls color in *Torrenticola*, but with several other species exhibiting great color variation (e.g., *T. tricolor, T. gorti*), we do not consider it useful to continue with the "morph" concept in this species.

Type deposition. Holotype (\bigcirc) , allotype (\bigcirc) , and most paratypes $(4 \bigcirc; 2 \bigcirc)$ deposited in the CNC; other paratypes $(2 \heartsuit; 2 \bigcirc)$ deposited in ACUA.

Diagnosis. Torrenticola tysoni are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malarkeyorum, T. pendula, T. sellersorum, T. ululata, T. whitneyae, T. microbiscutella,* and *T. feminellai*) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except *T. ululata* and *T. indistincta*), and being distributed in the east. It is one of only four Eastern 2-Plates that have dark, bold, bluish-purple coloration (also *T. biscutella, T. sellersorum*, and *T. pendula*). *T. tysoni* can be further differentiated from other Eastern 2-Plates by having a more elongate rostrum (length/width = Q = 3.06-3.31 in *T. tysoni*, 2.33–3.0 in others; $\mathcal{J} = 3.14-3.50$ in *T. tysoni*, 2.50–3.05 in others), except *T. feminellai* (3.05–3.38) and female *T. pendula* (3.0–3.06). *T. tysoni* can be differentiated from *T. feminellai* and *T. pendula* by dorsal coloration and pattern.

Description. FEMALE (Figure 259) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (610–670 (670) long; 450–475 (475) wide) ovoid with bold bluishpurple coloration separated into anterior and posterior portions, and with faint orange medially. Anterio-medial platelets (125–137.5 (135) long; 42.5–52.5 (52.5) wide).

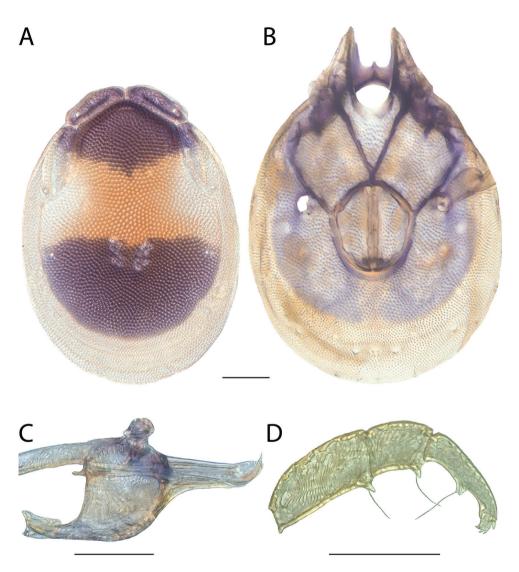

Figure 259. *Torrenticola tysoni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

Anterio-lateral platelets (162.5–175 (172.5) long; 55–67.5 (67.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–330 (330)). Dorsal plate proportions: dorsum length/width 1.35–1.41 (1.41); dorsal width/distance between Dgl-4 1.38–1.44 (1.44); anteriomedial platelet length/width 2.50–3.18 (2.57); anterio-lateral platelet length/width 2.56–3.18 (2.56); anterio-lateral/anterio-medial length 1.18–1.40 (1.28).

Gnathosoma — **Subcapitulum** (310–327.5 (327.5) long (ventral); 230–245 (245) long (dorsal); 130–135 (135) tall) mostly colorless. Rostrum (125–132.5 (130)

long; 40–42.5 (42.5) wide). Chelicerae (315–380 (350) long) with curved fangs (57.5–60 (60) long). Subcapitular proportions: ventral length/height 2.30–2.46 (2.43); rostrum length/width 3.06–3.31 (3.06). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (37.5–47.5 (45) long); femur (112.5–120 (120) long); genu (62.5–70 (70) long); tibia (80–90 (87.5) long; 22.5–25 (25) wide); tarsus (17.5–22.5 (20) long). Palpomere proportions: femur/genu 1.61–1.80 (1.71); tibia/femur 0.70–0.80 (0.73); tibia length/width 3.50–3.67 (3.50).

Venter — (715–790 (790) long; 505–560 (540) wide) with bold bluish-purple coloration. Gnathosomal bay (162.5–172.5 (172.5) long; 72.5–100 (85) wide). Cxgl-4 subapical. **Medial suture** (13.75–22.5 (22.5) long). **Genital plates** (175–185 (180) long; 152.5–155 (155) wide). Additional measurements: Cx-1 (280–315 (310) long (total); 115–145 (140) long (medial)); Cx-3 (310–350 (335) wide); anterior venter (150–172.5 (172.5) long). Ventral proportions: gnathosomal bay length/width 1.65–2.24 (2.03); anterior venter/genital field length 0.81–0.99 (0.96); anterior venter length/ genital field width 0.97–1.11 (1.11); anterior venter/medial suture 7.67–11.27 (7.67).

MALE (Figure 260) (n = 5) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (430–485 (460) long; 310–340 (320) wide) ovoid with bold bluishpurple coloration separated into anterior and posterior portions, and with faint orange medially. Anterio-medial platelets (97.5–127.5 (127.5) long; 35–40 (40) wide). Anterio-lateral platelets (127.5–137.5 (127.5) long; 42.5–50 (47.5) wide) fused to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 235–245 (240)). Dorsal plate proportions: dorsum length/width 1.39–1.48 (1.44); dorsal width/distance between Dgl-4 1.32–1.39 (1.33); anteriomedial platelet length/width 2.60–3.19 (3.19); anterio-lateral platelet length/width 2.65–3.00 (2.68); anterio-lateral/anterio-medial length 1.00–1.31 (1.00).

Gnathosoma — **Subcapitulum** (250–265 (250) long (ventral); 192.5–200 (195) long (dorsal); 77.5–95 (90) tall) mostly colorless. Rostrum (100–110 (100) long; 30–35 (30) wide). Chelicerae (237.5–260 (250) long) with curved fangs (45–47.5 (45) long). Subcapitular proportions: ventral length/height 2.76–3.23 (2.78); rostrum length/width 3.14–3.50 (3.33). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (33.75–48.75 (37.5) long); femur (87.5–97.5 (92.5) long); genu (52.5–62.5 (57.5) long); tibia (67.5–75 (75) long; 20–21.25 (21.25) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.56–1.68 (1.61); tibia/femur 0.72–0.81 (0.81); tibia length/width 3.18–3.63 (3.53).

Venter— (540–585 (560) long; 350–410 (360) wide) with bold bluish-purple coloration. Gnathosomal bay (110–122.5 (112.5) long; 62.5–67.5 (62.5) wide). Cxgl-4 subapical. **Medial suture** (85–115 (85) long). **Genital plates** (110–117.5 (110) long; 87.5–92.5 (92.5) wide). Additional measurements: Cx-1 (240–250 (240) long (total); 115–127.5 (122.5) long (medial)); Cx-3 (250–290 (265) wide); anterior venter (227.5–250 (232.5) long). Ventral proportions: gnathosomal bay length/width 1.69–1.85 (1.80); anterior venter/genital field length 1.98–2.13 (2.11); anterior venter length/ genital field width 2.51–2.86 (2.51); anterior venter/medial suture 2.17–2.74 (2.74).

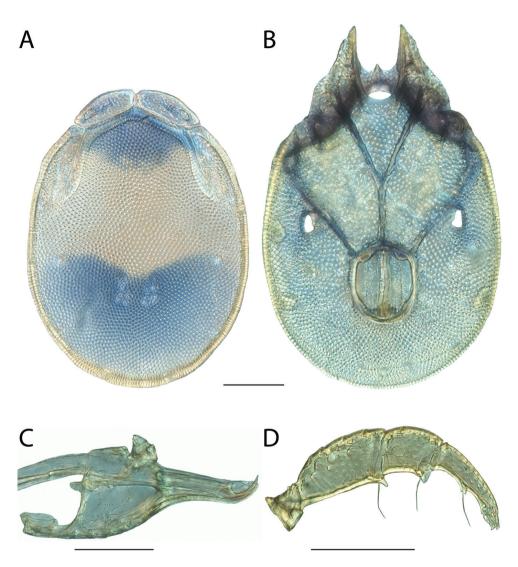

Figure 260. *Torrenticola tysoni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

IMMATURES unknown.

Etymology. Specific epithet (*tysoni*) named in honor of Neil Degrasse Tyson for his efforts in popularizing cosmology and science in general with *Cosmos: A Spacetime Odyssey* (2014), which was a worthy update to Carl Sagan's *Cosmos: A Personal Voyage* (1980).

Distribution. Known only from several localities along Natchez Trace Parkway (Figure 258).

Remarks. *Torrenticola tysoni* groups with other members of the Rusetria Complex with high support. Specimens of this species from Tennessee and Alabama are less than

1% different in COI sequence from each other and the specimen from Arkansas is less than 2% different from those. This species is greater than 10% different from sister species.

In all analyses, *T. tysoni* groups with two other species (*T. sellersorum* and *T. pendula*) as a paraphyletic grade at the base of the Eastern 2-Plate Identification Group. Based upon overall similarity, lateral platelets fused with the dorsal shield, and distribution, we were able to place this species within the Eastern 2-Plate Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola ululata Fisher & Dowling, sp. n.

http://zoobank.org/36729057-C4D7-4662-BF9B-B2854286F6CE

Material examined. HOLOTYPE (♀): from USA, Mississippi, Attala County, Hurricane Creek (33°4'N, 89°32'W), 13 Oct 1999, by IM Smith, IMS990071.

PARATYPES (2 \bigcirc ; 4 \circlearrowright): **Alabama, USA**: 1 \bigcirc from Lauderdale County, off Natchez Trace parkway, 7 km south of Tennessee state line (34°56'32"N, 87°49'43"W), 24 Sep 2009, by IM Smith, IMS090122 • 2 \circlearrowright from Lauderdale County, off Natchez Trace parkway, 7 km south of Tennessee state line (34°56'32"N, 87°49'43"W), 27 Sep 2010, by IM Smith, IMS100163 • **Mississippi, USA**: 1 \circlearrowright (ALLOTYPE) from Attala County, Hurricane Creek (33°4'58"N, 89°31'31"W), 30 Sep 2010, by IM Smith, IMS100168 • 1 \circlearrowright and 1 \circlearrowright from Attala County, Hurricane Creek (33°4'58"N, 89°31'31"W), 30 Sep 2010, by IM Smith, IMS100168 • 1 \circlearrowright and 1 \circlearrowright from Attala County, Hurricane Creek (33°4'58"N, 89°31'31"W), 30 Sep 2010, by IM Smith, IMS100168 • 1 \circlearrowright and 1 \circlearrowright from Attala County, Hurricane Creek (33°4'58"N, 89°31'31"W), 30 Sep 2010, by IM Smith, IMS100168 • 1 \circlearrowright and 1 \circlearrowright from Attala County, Hurricane Creek (33°4'58"N, 89°31'31"W), 30 Sep 2010, by IM Smith, IMS100168.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes (1 \bigcirc ; 2 \circlearrowright) deposited in the CNC; other paratypes (1 \bigcirc ; 1 \circlearrowright) deposited in ACUA.

Diagnosis. Torrenticola ululata are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malarkeyorum, T. pendula, T. sellersorum, T. tysoni, T. whitneyae, T. microbiscutella, and T. feminellai*) in having anterio-lateral platelets fused to the dorsal plate, and being distributed in the east. *T. ululata* can be differentiated from most *Torrenticola*, including other Eastern 2-Plates, by having a distinct dorsal pattern with a single dark spot posteriorly and an orange spot posterior to the dark spot. The only other species with this pattern is *T. unimaculata* and *T. kringi*, which both have anterio-lateral platelets free from the dorsal plate.

Description. FEMALE (Figure 262) (n = 3) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–580 (570) long; 400–450 (450) wide) circular or occasionally ovoid with coloration restricted to a single dark spot anteriorly, often with an orange spot posterior to the dark spot. Anterio-medial platelets (130–137.5 (130) long; 50–55 (55) wide). Anterio-lateral platelets (150–180 (150) long; 72.5–77.5 (72.5) wide) fused to dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 265–295 (265)). Dorsal plate proportions: dorsum length/

Figure 261. Torrenticola ululata sp. n. distribution.

width 1.27–1.41 (1.27); dorsal width/distance between Dgl-4 1.36–1.70 (1.70); anterio-medial platelet length/width 2.36–2.70 (2.36); anterio-lateral platelet length/width 2.07–2.32 (2.07); anterio-lateral/anterio-medial length 1.15–1.31 (1.15).

Gnathosoma — **Subcapitulum** (290–305 (290) long (ventral); 216–235 (216) long (dorsal); 130–140 (130) tall) colorless. Rostrum (125–125 (125) long; 42.5–45 (42.5) wide). Chelicerae (289–317 (289) long) with curved fangs (59–64 (64) long). Subcapitular proportions: ventral length/height 2.18–2.23 (2.23); rostrum length/ width 2.78–2.94 (2.94). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (42.5–45 (45) long); femur (117.5–122.5 (117.5) long); genu (67.5–75 (67.5) long); tibia (97.5–105 (97.5) long; 21.25–25 (21.25) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.63–1.74 (1.74); tibia/femur 0.83–0.86 (0.83); tibia length/width 4.20–4.59 (4.59).

Venter — (595–670 (670) long; 517–540 (518) wide) colorless. Gnathosomal bay (152.5–160 (152.5) long; 85–102.5 (85) wide). Cxgl-4 subapical. **Medial suture** (15–15 (15) long). **Genital plates** (155–170 (155) long; 147.5–157.5 (147.5) wide). Additional measurements: Cx-1 (276–282 (281) long (total); 115–126 (120) long (medial)); Cx-3 (357–382 (358) wide); anterior venter 155–160 (160) long). Ventral proportions: gnathosomal bay length/width 1.56–1.79 (1.79); anterior venter/genital field length 0.93–1.03 (1.03); anterior venter length/genital field width 0.98–1.08 (1.08); anterior venter/medial suture 10.33–10.67 (10.67).

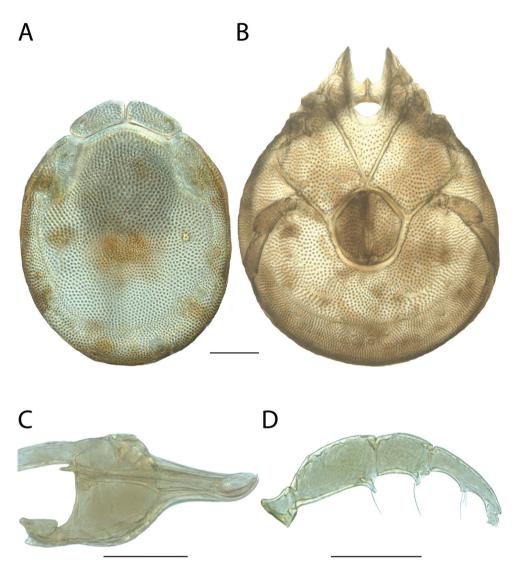

Figure 262. *Torrenticola ululata* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

MALE (Figure 263) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (460–510 (500) long; 355–380 (380) wide) circular or occasionally ovoid with coloration restricted to a single dark spot anteriorly, often with an orange spot posterior to the dark spot. Anterio-medial platelets (107.5–117.5 (110) long; 42.5–50 (42.5) wide). Anterio-lateral platelets (145–155 (155) long; 55–60 (60) wide) fused to dorsal plate. Dgl-4 approaching midway between muscle scars and dorsum edge (distance between Dgl-4 235–250 (250)). Dorsal plate proportions: dorsum length/width

1.30–1.38 (1.32); dorsal width/distance between Dgl-4 1.45–1.57 (1.52); anterio-medial platelet length/width 2.26–2.59 (2.59); anterio-lateral platelet length/width 2.52–2.77 (2.58); anterio-lateral/anterio-medial length 1.32–1.41 (1.41).

Gnathosoma — **Subcapitulum** (227.5–255 (247.5) long (ventral); 165–190 (176) long (dorsal); 90–100 (100) tall) colorless. Rostrum (90–102.5 (100) long; 32.5–38.75 (37.5) wide). Chelicerae (225–254 (225) long) with curved fangs (34–49 (46) long). Subcapitular proportions: ventral length/height 2.48–2.55 (2.48); rostrum length/width 2.61–2.77 (2.67). **Pedipalps** with tuberculate ventral extensions on

femora and genua. Palpomeres: trochanter (37.5–40 long); femur (92.5–100 (100) long); genu (57.5–65 (60) long); tibia (77.5–92.5 (85) long; 20–22.5 (20) wide); tarsus (15–17.5 (15) long). Palpomere proportions: femur/genu 1.54–1.67 (1.67); tibia/ femur 0.84–0.93 (0.85); tibia length/width 3.88–4.25 (4.25).

Venter — (580–620 (580) long; 425–487 (426) wide) colorless. Gnathosomal bay (110–125 (110) long; 67.5–75 (67.5) wide). Cxgl-4 subapical. **Medial suture** (80–100 (100) long). **Genital plates** (117.5–122.5 (120) long; 102.5–110 (107.5) wide). Additional measurements: Cx-1 (246–257 (257) long (total); 124–129 (125) long (medial)); Cx-3 (283–326 (290) wide); anterior venter (220–257.5 (252.5) long). Ventral proportions: gnathosomal bay length/width 1.63–1.67 (1.63); anterior venter/ genital field length 1.87–2.17 (2.10); anterior venter length/genital field width 2.05–2.49 (2.35); anterior venter/medial suture 2.53–3.19 (2.53).

IMMATURES unknown.

Etymology. Specific epithet (*ululata*) refers to the dorsal coloration resembling a wailing mouth, where the dark anterior spot is the oral cavity and the posterior red spot is the tongue (*ululatus*, L. shriek, wail).

Distribution. Southeastern, Mississippi and Alabama (Figure 261).

Remarks. *Torrenticola ululata* groups with other members of the Rusetria Complex with high support. The two specimens included in our molecular analyses were less than 1% different in COI sequence from each other and 11–12% different from sister species.

Based upon overall similarity, lateral platelets fused with the dorsal shield, and distribution, we were able to place this species within the Eastern 2-Plate Identification Group.

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Juniper, 21 Jun 2012, by IM Smith, IMS120036, DNA 3011 • 1 \bigcirc and 1 \bigcirc from York County, SW Mirimachi River, beside Highway 107 between Napdogan and Juniper, 21 Jun 2012, by IM Smith, IMS120036.

Type deposition. Holotype (\bigcirc), allotype (\circlearrowright), and most paratypes ($4 \bigcirc$; $3 \circlearrowright$) deposited in the CNC; other paratypes ($3 \heartsuit$; $3 \circlearrowright$) deposited in ACUA.

Diagnosis. Torrenticola unimaculata are similar to other members of the Tricolor Complex (*T. bittikoferae, T. hoosieri, T. larvata, T. pearsoni, T. olliei, T. sierrensis, T. tricolor, T. trimaculata, T. cardia, T. kringi, T. dimorpha,* and *T. mohawk*) in having a short, conical rostrum. *T. unimaculata* can be differentiated from most *Torrenticola,* including other members of the Tricolor Complex, by having a distinct dorsal pattern of a large anterior dorsal spot. The only other species with this pattern is *T. ululata,* which, like all Rusetria 2-Plates, have anterio-lateral platelets fused to the dorsal plate and *T. kringi,* which has a more elongate rostrum (length/width = 1.9–2.2 in *T. unimaculata,* 2.6–3.2 in *T. kringi*). *T. unimaculata* are most similar to other members of the Tricolor Complex that have bold patterning (*T. larvata, T. tricolor, T. trimaculata, T. cardia, T. kringi,* and *T. mohawk*). Female *T. unimaculata* can be further differentiated from these members of the complex by having a longer medial suture (Q = 40-47.5in *T. unimaculata,* 15–35 in others), except *T. cardia* (25–50) and *T. mohawk* (30–45).

Description. FEMALE (Figure 265) (n = 6) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

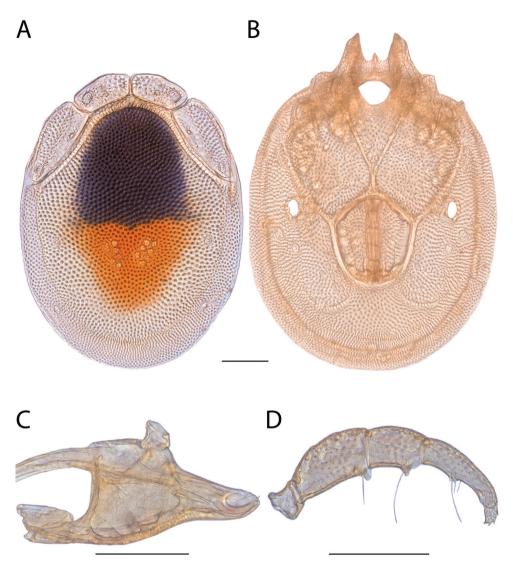

Figure 265. *Torrenticola unimaculata* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

Dorsum — (650–730 (720) long; 490–600 (600) wide) ovoid with coloration restricted to a single dark spot anteriorly (occasionally extending medially), with an orange spot posterior to the dark spot. Anterio-medial platelets (127.5–145 (140) long; 62.5–70 (67.5) wide). Anterio-lateral platelets (172.5–200 (200) long; 72.5–80 (80) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 350–425 (425)). Dorsal plate proportions: dorsum length/width 1.20–1.39 (1.20); dorsal width/distance between Dgl-4 1.34–1.41 (1.41); anterio-medial platelet length/width 1.89–2.08 (2.07); anterio-

lateral platelet length/width 2.29–2.57 (2.50); anterio-lateral/anterio-medial length 1.35–1.44 (1.43).

Gnathosoma — **Subcapitulum** (242.5–265 (265) long (ventral); 176.25–194 (190) long (dorsal); 110–125 (125) tall) colorless. Rostrum (85–100 (92.5) long; 42.5–47.5 (47.5) wide) short and conical. Chelicerae (236–252 (250) long) with curved fangs (51–61.5 (55) long). Subcapitular proportions: ventral length/height 2.12–2.26 (2.12); rostrum length/width 1.89–2.18 (1.95). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–42.5 (42.5) long); femur (91.25–100 (100) long); genu (62.5–67.5 (67.5) long); tibia (80–87.5 (87.5) long; 25–26.25 (26.25) wide); tarsus (20–25 (22.5) long). Palpomere proportions: femur/genu 1.46–1.52 (1.48); tibia/femur 0.81–0.93 (0.88); tibia length/width 3.20–3.40 (3.33).

Venter — (700–860 (860) long; 539–630 (630) wide) colorless. Gnathosomal bay (110–140 (140) long; 75–87.5 (80) wide). Cxgl-4 subapical. **Medial suture** (40–47.5 (40) long). **Genital plates** (180–210 (210) long; 152.5–170 (170) wide). Additional measurements: Cx-1 (243–290 (290) long (total); 128–162 (145) long (medial)); Cx-3 (358–426 (390) wide); anterior venter (182.5–205 (195) long). Ventral proportions: gnathosomal bay length/width 1.40–1.75 (1.75); anterior venter/genital field length 0.93–1.14 (0.93); anterior venter length/genital field width 1.15–1.30 (1.15); anterior venter/medial suture 4.06–4.88 (4.88).

MALE (Figure 266) (n = 6) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum— (525–690 (690) long; 400–520 (520) wide) ovoid with coloration restricted to a single dark spot anteriorly (occasionally extending medially), with an orange spot posterior to the dark spot. Anterio-medial platelets (112.5–137.5 (137.5) long; 57.5–72.5 (72.5) wide). Anterio-lateral platelets (160–205 (205) long; 65–82.5 (82.5) wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 320–405 (405)). Dorsal plate proportions: dorsum length/width 1.30–1.43 (1.33); dorsal width/distance between Dgl-4 1.23–1.28 (1.28); anterio-medial platelet length/width 1.90–2.09 (1.90); anterio-lateral platelet length/width 2.28–2.54 (2.48); anterio-lateral/anterio-medial length 1.35–1.43 (1.33).

Gnathosoma — **Subcapitulum** (212.5–255 (255) long (ventral); 155–185 (185) long (dorsal); 90–110 (110) tall) colorless. Rostrum (80–95 (95) long; 37.5–48.75 (48.75) wide) short and conical. Chelicerae (195–235 (235) long) with curved fangs (42–55 (55) long). Subcapitular proportions: ventral length/height 2.32–2.42 (2.32); rostrum length/width 1.95–2.2 (1.95). Pedipalps with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (32.5–40 (40) long); femur (80–97.5 (97.5) long); genu (55–67.5 (67.5) long); tibia (70–80 (80) long; 22.5–27.5 (27.5) wide); tarsus (20–22.5 (22.5) long). Palpomere proportions: femur/genu 1.39–1.48 (1.44); tibia/femur 0.82–0.91 (0.82); tibia length/width 2.90–3.11 (2.91).

Venter — (640–800 (800) long; 448–570 (570) wide) colorless. Gnathosomal bay (97.5–132.5 (132.5) long; 62.5–77.5 (72.5) wide). Cxgl-4 subapical. Medial suture (107.5–125 (125) long). Genital plates (130–161.25 (161.25) long; 92.5–112.5

(112.5) wide). Additional measurements: Cx-1 (218–338 (290) long (total); 109–165 (165) long (medial)); Cx-3 (218–338 (290) wide); anterior venter (265–300 (300) long). Ventral proportions: gnathosomal bay length/width 1.44–1.83 (1.83); anterior venter/genital field length 1.86–2.13 (1.86); anterior venter length/genital field width 2.67–2.92 (2.67); anterior venter/medial suture 2.30–2.49 (2.40).

IMMATURES unknown.

Etymology. Specific epithet (*unimaculata*) named for the single dark dorsal spot of this species (*unus*, L. one; *macula*, L. spot).

Distribution. Known only from Arkansas and New Brunswick (Figure 264).

Remarks. *Torrenticola unimaculata* groups with other members of the Tricolor Complex with high support and specimens of this species are less than 2% different in COI sequence from each other. In all analyses, *T. unimaculata* groups with two other species which also have dorsal spots: *T. trimaculata* and *T. tricolor*. This clade represents some of the most distinctive of all *Torrenticola*. This species is greater than 7% different in COI from sister species.

This species hypothesis is supported by high divergence between species (3–15%), and by the morphological characters outlined in the diagnosis.

Type deposition. Types $(2 \ \bigcirc; 2 \ \bigcirc)$ deposited in the CNC.

Diagnosis. *Torrenticola ventura* is unlike all other western species by having the following combination of characters: anterio-lateral platelets free (fused to dorsal plate

in Rusetria Complex); dorsal coloration separated into anterior and posterior portions (restricted posteriorly in *T. tahoei*, *T. oregonensis*, *T. raptoroides*, and *T. sharkeyi*, without pattern in *T. regalis*, colorless in *T. occidentalis*, Rala Group, *T. wiedenmanni*); ellipsoid body (circular in *T. sierrensis* and *T. raptoroides*, rectangular in *T. ellipsoidalis*); unmodified rostrum (short and conical in *T. olliei*, *T. sierrensis*, *T. ellipsoidalis* and *T. leviathan*); tuberculate ventral extensions on pedipalp genua (flanged in Miniforma group); and smaller body size than *T. multiforma* (dorsum length Q = 650-780 in *T. ventura*, 765–885 in *T. multiforma*; a = 540-630 in *T. ventura*, 725–850 in *T. multiforma*). *T. ventura* are most similar to members of the Neoanomala Group, which are eastern.

Re-description. FEMALE (Figure 268) (n = 7) with characters of the genus with following specifications.

Dorsum — (650–780 long; 470–550 wide) ovoid with bluish-purple coloration (often faint) separated into anterior and posterior portions with orange medially. Anterio-medial platelets (145–152.5 long; 57.5–62.5 wide). Anterio-lateral platelets (195–227.5 long; 67.5–80 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 355–400). Dorsal plate proportions: dorsum length/width 1.34–1.46; dorsal width/distance between Dgl-4 1.29–1.42; anterio-medial platelet length/width 2.32–2.65; anterio-lateral platelet length/width 2.70–3.03; anterio-lateral/anterio-medial length 1.28–1.57.

Gnathosoma — **Subcapitulum** (350–397.5 long (ventral); 267–297 long (dorsal); 147.5–167.5 tall) colorless. Rostrum (137.5–155 long; 50–60 wide). Chelicerae (375–415 long) with curved fangs (63–80 long). Subcapitular proportions: ventral length/height 2.30–2.47; rostrum length/width 2.58–2.95. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5–60 long); femur (125–143.75 long); genu (75–82.5 long); tibia (92.5–102.5 long; 25–28.75 wide); tarsus (17.5–25 long). Palpomere proportions: femur/genu 1.67–1.80; tibia/femur 0.71–0.75; tibia length/width 3.36–3.73.

Venter — (740–910 long; 550–667 wide) often with faint bluish-purple coloration. Gnathosomal bay (175–202.5 long; 87.5–122.5 wide). Cxgl-4 subapical. **Medial suture** (22.5–30 long). **Genital plates** (170–200 long; 167.5–182.5 wide). Additional measurements: Cx-1 (322–365 long (total); 137–173 long (medial)); Cx-3 (22.5–30 wide); anterior venter 197.5–220 long). Ventral proportions: gnathosomal bay length/width 1.49–2.25; anterior venter/genital field length 1.05–1.16; anterior venter length/genital field width 1.08–1.22; anterior venter/medial suture 7.18–8.78.

MALE (Figure 269) (n = 7) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–630 long; 370–430 wide) ovoid with bluish-purple coloration (often faint) separated into anterior and posterior portions with orange medially. Anterio-medial platelets (105–135 long; 47.5–55 wide). Anterio-lateral platelets (172.5–197.5 long; 60–62.5 wide) free from dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 280–315). Dorsal plate proportions: dorsum length/width 1.43–1.53; dorsal width/distance between Dgl-4

long); femur (106.25–117.5 long); genu (65–72.5 long); tibia (81.25–91.25 long; 23.75–27.5 wide); tarsus (15–21.25 long). Palpomere proportions: femur/genu 1.62–1.70; tibia/femur 0.74–0.81; tibia length/width 3.32–3.42.

Venter — (650–785 long; 436–500 wide) often with faint bluish-purple coloration. Gnathosomal bay (122.5–162.5 long; 78.75–85 wide). Cxgl-4 subapical. **Medial** suture (97.5–125 long). **Genital plates** (122.5–142.5 long; 100–112.5 wide). Additional measurements: Cx-1 (263.5–325 long (total); 155–164 long (medial)); Cx-3 (319–357.5 wide); anterior venter (265–305 long). Ventral proportions: gnathosomal bay length/width 1.53–1.97; anterior venter/genital field length 2.02–2.25; anterior venter length/genital field width 2.55–2.81; anterior venter/medial suture 2.36–2.72.

IMMATURES unknown.

Etymology. Although Habeeb (1973) did not specify an etymology for the specific epithet (*ventura*), it surely refers to the type locality—Ventura River in Ventura County, California.

Distribution. California and southwest Oregon (Figure 267). *T. ventura* was previously known only from Ventura County in southwestern California; we extend the range northward.

Remarks. Our analyses were unable to confidently place *Torrenticola ventura* phylogenetically. Both analyses place this species at the base of the Raptor Complex, but this relationship was not well-supported. Because of this ambiguity, we refrain from placing this species in a species complex. Furthermore, because of the unique morphology, we are also unable to place this species within an identification group.

All specimens are less than 1% different in COI sequence and are greater than 15% different from sister species. This species hypothesis is supported by biogeography, low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Figure 270. Torrenticola walteri sp. n. distribution.

Diagnosis. Torrenticola walteri are similar to other members of the Rusetria "Western 2-Plates" group (T. mulleni, T. nortoni, and T. welbourni) in having anterio-lateral platelets fused to the dorsal plate, having faint dorsal coloration, and being distributed in the west. Female T. walteri can be differentiated from T. welbourni (female only known) by having stockier pedipalp tibiae (3.09–3.23 in A32, 3.73 in A30); shorter pedipalp femora (112.5-125 in A32, 137.5 in A30); and a more elongate subcapitulum (ventral length/height: 2.21-2.34 in A32, 2.47 in A30). T. walteri can be differentiated from *T. mulleni* by having a slightly stockier gnathosomal bay (Q = 1.57 - 1.84in *T. walteri*, 1.89–2.16 in *T. mulleni*, ♂ = 1.55–1.73 in *T. walteri*, 1.77–1.93 in *T.* mulleni) and by being distributed in California, Oregon and British Columbia, instead of in the Rocky Mountains (Idaho, Montana, Utah and Wyoming). Additionally, male T. walteri can be differentiated from male T. mulleni by having a shorter genital field (115–117.5 in A32, 130–140 in A31), and female T. walteri can be differentiated from female T. mulleni by having a shorter medial suture (10-12.5 in T. walteri, 20-22.5 in T. mulleni). Female T. walteri can be differentiated from female T. nortoni by having slightly shorter pedipalp femora with respect to genua (1.52–1.64 in T. walteri, 1.69–1.82 in T. nortoni) and slightly stockier anterio-medial platelets (2.58–2.72 in T. walteri, 2.74-3.06 in T. nortoni). Male T. walteri can be differentiated from male T. nortoni by having longer pedipalp femora (95-100 in T. walteri, 85-92.5 in T. nortoni) and slightly more elongate pedipalp tibiae (3.05–3.10 in T. walteri, 2.73–3.0 in T. nortoni).

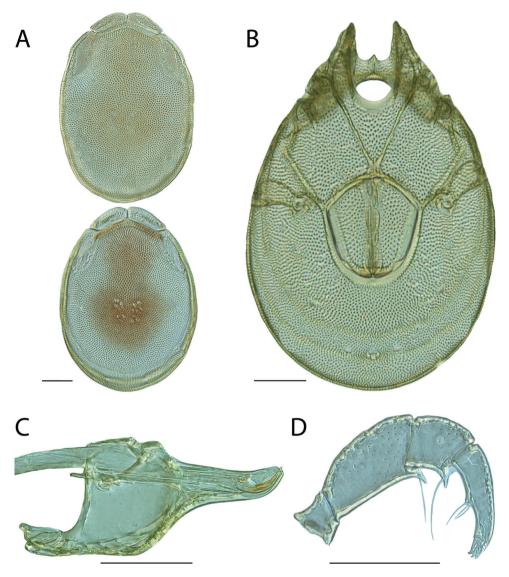

Figure 271. *Torrenticola walteri* sp. n. female: **A** dorsal plates, note color variation **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

Description. FEMALE (Figure 271) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (580–640 (590) long; 420–450 (420) wide) ovoid with orange coloration separated into anterior and posterior portions, occasionally faint. Anteriomedial platelets (120–137.5 (120) long; 45–51.25 (45) wide). Anterio-lateral platelets (157.5–190 (157.5) long; 55–65 (55) wide) fused with dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 300–325 (300)). Dorsal plate proportions: dorsum length/width 1.35–1.44 (1.40); dorsal width/distance between Dgl-4 1.37–1.45 (1.40); anterio-medial platelet length/ width 2.58–2.72 (2.67); anterio-lateral platelet length/width 2.63–3.27 (2.86); anterio-lateral/anterio-medial length 1.29–1.46 (1.31).

Gnathosoma — **Subcapitulum** (305–335 (317.5) long (ventral); 223–243 (224) long (dorsal); 135–147.5 (137.5) tall) colorless. Rostrum (122.5–127.5 (123.75) long; 45–50 (47.5) wide). Chelicerae (304–328 (304) long) with curved fangs (55.75–64 (63) long). Subcapitular proportions: ventral length/height 2.21–2.34 (2.31); rostrum length/width 2.45–2.72 (2.61). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5–52.5 (50) long); femur (112.5–125 (115) long); genu (70–82.5 (70) long); tibia (85–88.75 (88.75) long; 27.5–27.5 (27.5) wide); tarsus (17.5–20 (20) long). Palpomere proportions: femur/genu 1.52–1.64 (1.64); tibia/femur 0.70–0.77 (0.77); tibia length/width 3.09–3.23 (3.23).

Venter — (690–730 (725) long; 467–520 (467) wide) colorless. Gnathosomal bay (141.25–175 (157.5) long; 86.25–95 (86.25) wide). Cxgl-4 subapical. **Medial suture** (10–12.5 (10) long). **Genital plates** (185–197.5 (197.5) long; 158.75–181.25 (180) wide). Additional measurements: Cx-1 (250–300 (285) long (total); 102–127 (119) long (medial)); Cx-3 (313–362 (313) wide); anterior venter (140–158.75 (150) long). Ventral proportions: gnathosomal bay length/width 1.57–1.84 (1.83); anterior venter/genital field length 0.75–0.86 (0.76); anterior venter length/genital field width 0.83–0.96 (0.83); anterior venter/medial suture 11.20–15.88 (15.00).

MALE (Figure 272) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (490–510 (510) long; 340–350 (350) wide) ovoid with orange coloration separated into anterior and posterior portions, occasionally faint. Anteriomedial platelets (105–115 (115) long; 40–42.5 (42.5) wide). Anterio-lateral platelets (125–142.5 (142.5) long; 47.5–52.5 (52.5) wide) fused with dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 255–270 (270)). Dorsal plate proportions: dorsum length/width 1.43–1.46 (1.46); dorsal width/distance between Dgl-4 1.30–1.33 (1.30); anterio-medial platelet length/ width 2.63–2.71 (2.71); anterio-lateral platelet length/width 2.63–2.71 (2.71); anter-io-lateral platelet length.

Gnathosoma — **Subcapitulum** (265–270 (270) long (ventral); 179–202.5 (195) long (dorsal); 93.75–105 (95) tall) colorless. Rostrum (100–102.5 (102.5) long; 37.5–38.75 (37.5) wide). Chelicerae (240–265 (265) long) with curved fangs (38–50 (50) long). Subcapitular proportions: ventral length/height 2.52–2.85 (2.84); rostrum length/width 2.65–2.73 (2.73). **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (35–40 (35) long); femur (95–100 (100) long); genu (57.5–60 (57.5) long); tibia (72.5–77.5 (72.5) long; 23.75–25 (23.75) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.65–1.74 (1.74); tibia/femur 0.73–0.82 (0.73); tibia length/width 3.05–3.10 (3.05).

Venter — (590–625 (625) long; 387.5–410 (410) wide) colorless. Gnathosomal bay (112.5–127.5 (127.5) long; 72.5–78.75 (73.75) wide). Cxgl-4 subapical. Medial

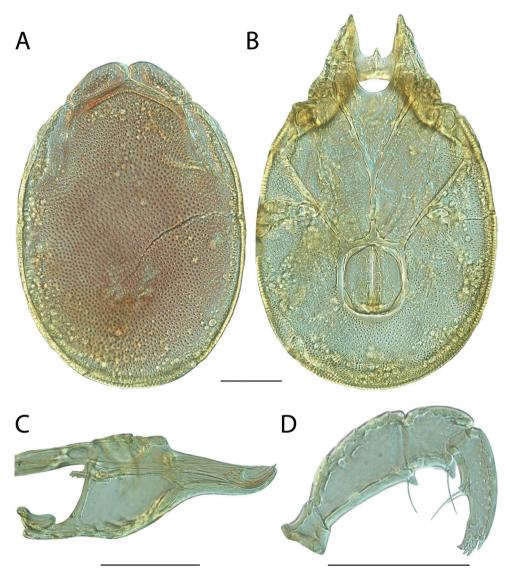

Figure 272. *Torrenticola walteri* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 µm.

suture (85–107.5 (107.5) long). **Genital plates** (115–117.5 (116.25) long; 95–98.75 (95) wide). Additional measurements: Cx-1 (255–273 (270) long (total); 136–157 (150) long (medial)); Cx-3 (253–316 (285) wide); anterior venter (245–262.5 (262.5) long). Ventral proportions: gnathosomal bay length/width 1.55–1.73 (1.73); anterior venter/genital field length 2.12–2.26 (2.26); anterior venter length/genital field width 2.48–2.76 (2.76); anterior venter/medial suture 2.44–2.88 (2.44).

IMMATURES unknown.

Etymology. Specific epithet (*walteri*) named in honor of acarologist Dave Walter for solidifying JRF's interest in mites with his popular book on mites (*Mites: Ecology, Evolution & Behaviour – Life at a Microscale*) and by teaching JRF the mesostigmatan mite section of the Acarology Summer Program at The Ohio State University in 2009.

Distribution. Probably throughout the Pacific Coastal Ranges of California, Oregon, Washington, and southern British Columbia (Figure 270). We also collected *T. walteri* in the Rocky Mountains of British Columbia, indicating this species might occur in the northern Rockies of Canada. However, given our sampling effort in the Rockies, we doubt the occurrence of this species in most of the US Rockies.

Remarks. Torrenticola walteri groups with other members of the Rusetria Complex with high support and specimens are less than 2% different in COI sequence from each other. In the all analyses, *T. walteri* groups with the three other members of the Rusetria Complex that are found in western North America: *T. mulleni*, *T. nortoni*, and *T. welbourni*. These species are 5–7% different in COI sequence from each other and together make up the Western 2-Plate Identification Group. *Torrenticola walteri* is one of three of these that occur in California (including *T. nortoni* and *T. welbourni*).

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola welbourni Fisher & Dowling, sp. n. http://zoobank.org/084524AE-73BB-4940-BFD2-53D9DEB897B1

Material examined. HOLOTYPE (Q): from USA, California, Trinity County, Shasta-Trinity National Forest, Wilson Creek (40°25'17"N, 123°3'5"W), 20 Aug 2013, by JR Fisher, JRF 13-0820-003, DNA 1638.

Type deposition. Holotype (\bigcirc) deposited in the CNC.

Diagnosis. Torrenticola welbourni are similar to other members of the Rusetria "Western 2-Plates" group (*T. mulleni*, *T. nortoni*, and *T. walteri*) in having anteriolateral platelets fused to the dorsal plate, having faint dorsal coloration, and being distributed in the west. *T. welbourni* (only female known) can be differentiated from all other Western 2-plates by being larger (dorsal length: 690 in *T. welbourni*, 570–645 in others; dorsal width: 500 in *T. welbourni*, 415–480 in others), having more elongate pedipalp tibiae (length/width: 3.73 in *T. welbourni*, 3.0–3.33 in others) and longer pedipalp femora (137.5 in A30, 112.5–125 in others).

Description. FEMALE (Figure 274) (n = 1) (holotype only) with characters of the genus with following specifications.

Dorsum — (690 long; 500 wide) ovoid with faint orange coloration separated into anterior and posterior portions. Anterio-medial platelets (152.5 long; 57.5 wide). Anterio-lateral platelets (195 long; 72.5 wide) fused to dorsal plate. Dgl-4 closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4/dorsal width

Figure 273. Torrenticola welbourni sp. n. distribution.

325). Dorsal plate proportions: dorsum length/width 1.38; dorsum width/distance between Dgl-4 1.54; anterio-medial platelet length/width 2.65; anterio-lateral platelet length/width 2.69; anterio-lateral/anterio-medial length 1.28.

Gnathosoma — **Subcapitulum** (357.5 long (ventral); 270 long (dorsal); 145 tall) colorless. Rostrum (145 long; 52.5 wide). Chelicerae (356 long) with curved fangs (70 long). Subcapitular proportions: ventral length/height 2.47; rostrum length/width 2.76. **Pedipalps** with tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (50 long); femur (137.5 long); genu (75 long); tibia (102.5 long; 27.5 wide); tarsus (20 long). Palpomere proportions: femur/genu 1.83; tibia/femur 0.75; tibia length/width 3.73.

Venter — (820 long; 580.25 wide) colorless. Gnathosomal bay (180 long; 100 wide). Cxgl-4 subapical. **Medial suture** (12.5 long). **Genital plates** (180 long; 167.5 wide). Additional measurements: Cx-1 (324 long (total); 122 long (medial)); Cx-3 (371 wide); anterior venter (177.5 long). Ventral proportions: gnathosomal bay length/width 1.80; anterior venter/genital field length 0.99; anterior venter length/ genital field width 1.06; anterior venter/medial suture 14.20.

MALE unknown.

IMMATURES unknown.

Etymology. Specific epithet (*welbourni*) named in honor of acarologist Cal Welbourn, who has been instrumental in teaching terrestrial Parasitengona to JRF and for

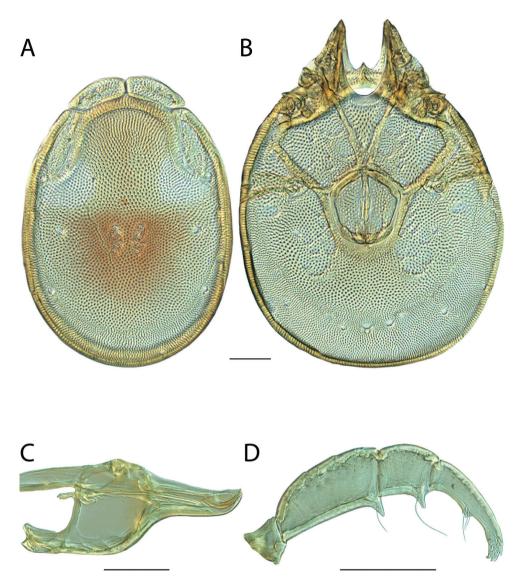

Figure 274. *Torrenticola welbourni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

teaching JRF the prostigmatan mite section of the Acarology Summer Program at The Ohio State University in 2009.

Distribution. Only known from Trinity County, California (Figure 273).

Remarks. *Torrenticola welbourni* groups with other members of the Rusetria Complex with high support. Unfortunately, only a single specimen is known of this species, so variation in COI sequence could not be investigated. This specimen was collected from the sample that contained specimens of *T. walteri*. It is interesting to note

that these two species are the only Rusetria Complex members collected from Trinity County. In the all analyses, *T. welbourni* groups with the three other members of the Rusetria Complex that are found in western North America: *T. mulleni*, *T. nortoni*, and *T. walteri*. These species are 5–7% different in COI sequence from each other and together make up the Western 2-Plate Identification Group. *Torrenticola welbourni* is one of three of these that occur in California (including *T. nortoni* and *T. walteri*).

This species hypothesis is supported by low COI divergence within the species (0-2%) and high divergence between species (3-15%), and by the morphological characters outlined in the diagnosis.

Torrenticola whitneyae Fisher & Dowling, sp. n. http://zoobank.org/EA7DE1AF-7A8D-4644-A7BB-D8601472CE09

Material examined. HOLOTYPE (♀): from USA, North Carolina, Yancey County, Lost Cove Picnic Area beside Forest Road 472, 2.8 km west of Rt. 80, (35°45'45"N, 82°12'12"W), 12 September 2005, by IM Smith, IMS050074

PARATYPES (4 \bigcirc ; 3 \circlearrowright): **North Carolina, USA**: 1 \bigcirc and 1 \circlearrowright from Haywood County, Great Smoky Mountains National Park; Cataloochee; beside Mt. Sterling Rd. near bridge 1.7 km n. of road to Campground, (35°38'38"N, 83°4'4"W), 6 September 2009, by IM Smith, IMS090099 • 2 \bigcirc from Swain County, Great Smokey Mountain National Park, Deep Creek upstream of picnic area, (35°27'27"N, 83°26'26"W), 14 September 2009, by AJ Radwell, AJR090007A • 1 \circlearrowright (ALLOTYPE) from Yancey County, Lost Cove Picnic Area beside Forest Road 472, 2.8 km west of Rt. 80, (35°45'45"N, 82°12'12"W), 12 September 2005, by IM Smith, IMS050074 • 1 \bigcirc and 1 \circlearrowright from Yancey County, Lost Cove Picnic Area beside Forest Road 472, 2.8 km west of Rt. 80, (35°45'45"N, 82°12'12"W), 12 September 2005, by IM Smith, IMS050074 • 1 \bigcirc km west of Rt. 80, (35°45'45"N, 82°12'12"W), 12 September 2005, by IM Smith, IMS050074.

Type deposition. Holotype (\bigcirc) , allotype (O), and some paratypes $(2 \bigcirc; 1 \textcircled{O})$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \textcircled{O})$ deposited in the ACUA.

Diagnosis. Torrenticola whitneyae are similar to other members of the Rusetria "Eastern 2-Plates" group (*T. biscutella, T. caerulea, T. delicatexa, T. indistincta, T. malarkeyorum, T. pendula, T. sellersorum, T. tysoni, T. ululata, T. microbiscutella,* and *T. feminellai*) in having anterio-lateral platelets fused to the dorsal plate, having dorsal coloration separated into anterior and posterior portions (except *T. ululata* and *T. indistincta*), and being distributed in the east. *T. whitneyae* is most similar to *T. pendula*, which also has purple coloration separated into anterior and posterior and posterior and posterior portions and often connected by a stripe medially. *T. whitneyae* is best differentiated from *T. pendula* by having a stockier rostrum (length/width = 2.41-2.69 in *T. whitneyae*, 2.87-3.06 in *T. pendula*). *T. whitneyae* can be differentiated from *T. indistincta*, and *T. feminellai* by dorsal coloration and pattern. *T. whitneyae* can be differentiated from all other Eastern 2-Plates by having stockier pedipalpal tibiae (Q = 2.42-2.95 in *T. whitneyae*, 3.00-4.59 in others; $\delta = 2.48-2.70$ in *T. whitneyae*, 2.78-4.25 in others),

Figure 275. Torrenticola whitneyae sp. n. distribution.

except female *T. delicatexa* (Q = 2.92-3.61). *T. whitneyae* can be differentiated from *T. delicatexa* by having a slightly rounder dorsum (length/width Q = 1.26-1.38 in *T. whitneyae*, 1.38–1.44 in *T. delicatexa*; $\mathcal{J} = 1.35-1.37$ in *T. whitneyae*, 1.44–1.56 in *T. delicatexa*) and by dorsal coloration.

Description. FEMALE (Figure 276) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (550–690 (630) long; 400–520 (500) wide) ovoid with reddishpurple coloration both anteriorly and posteriorly connected medially. Anterio-medial platelets (120–163.75 (142.5) long; 41.25–52.5 (52.5) wide). Anterio-lateral platelets (170–220 (200)) long; 65–85 (85) wide) partially fused, at least posteriorly, to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 310–385 (370)). Dorsal plate proportions: dorsum length/width 1.26–1.38 (1.26); dorsal width/distance between Dgl-4 1.29–1.37 (1.35); anteriomedial platelet length/width 2.71–3.12 (2.71); anterio-lateral platelet length/width 2.35–2.84 (2.35); anterio-lateral/anterio-medial length 1.32–1.42 (1.40).

Gnathosoma — **Subcapitulum** (310–385 (362.5) long (ventral); 237.5–285 (270) long (dorsal); 145–185 (177.5) tall) colorless. Rostrum (125–140 (135) long; 47.5–55 (55) wide). Chelicerae (310–415 (395) long) with curved fangs (65–80 (75) long). Subcapitular proportions: ventral length/height 1.95–2.14 (2.04); rostrum length/width 2.41–2.63 (2.45). **Pedipalps** stocky with short, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (50–56.25 (55) long); femur

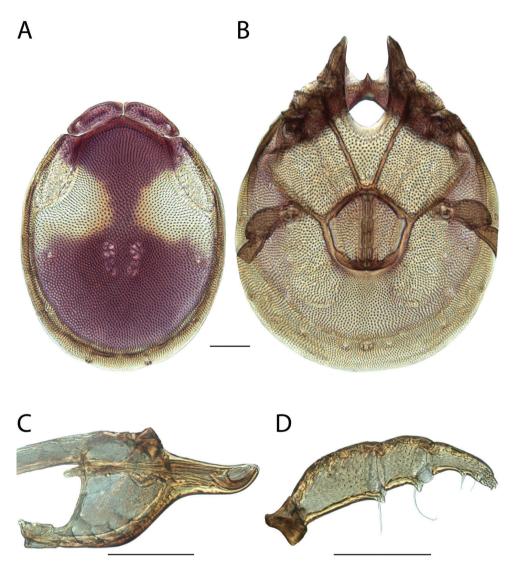

Figure 276. *Torrenticola whitneyae* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

(67.5–80 (75) long); genu (67.5–80 (75) long); tibia (72.5–80 (80) long; 26.25–30 (28.75) wide); tarsus (17.5–20 (17.5) long). Palpomere proportions: femur/genu 1.59–1.71 (1.63); tibia/femur 0.59–0.68 (0.65); tibia length/width 2.42–2.95 (2.78).

Venter — (630–810 (780) long; 470–630 (590) wide) with faint reddish-purple coloration. Gnathosomal bay (175–222.5 (210) long; 80–105 (105) wide). Cxgl-4 subapical. **Medial suture** absent. **Genital plates** (185–195 (187.5) long; 165–195 (180) wide). Additional measurements: Cx-1 (280–360 (350) long (total); 110–140 (135) long (medial)); Cx-3 (320–435 (405) wide); anterior venter (110–145 (140)

long). Ventral proportions: gnathosomal bay length/width 2.00–2.59 (2.00); anterior venter/genital field length 0.59–0.75 (0.75); anterior venter length/genital field width 0.67–0.80 (0.78).

MALE (Figure 277) (n = 3) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (540–560 (540) long; 395–410 (395) wide) ovoid with reddishpurple coloration both anteriorly and posteriorly connected medially. Anterio-medial platelets (122.5–135 (135) long; 45–50 (50) wide). Anterio-lateral platelets (170–170 (170) long; 60–67.5 (60) wide) partially fused, at least posteriorly, to dorsal plate. Dgl-4 much closer to the edge of the dorsum than to the muscle scars (distance between Dgl-4 290–310 (295)). Dorsal plate proportions: dorsum length/width 1.35–1.37 (1.37); dorsal width/distance between Dgl-4 1.32–1.38 (1.34); anterio-medial platelet length/width 2.55–2.72 (2.70); anterio-lateral platelet length/width 2.52–2.83 (2.83); anterio-lateral/anterio-medial length 1.26–1.39 (1.26).

Gnathosoma — **Subcapitulum** (290–305 (300) long (ventral); 220–225 (222.5) long (dorsal); 120–135 (135) tall) colorless. Rostrum (107.5–112.5 (112.5) long; 40–42.5 (42.5) wide). Chelicerae (310–310 (310) long) with curved fangs (60–60 (60) long). Subcapitular proportions: ventral length/height 2.22–2.42 (2.22); rostrum length/ width 2.65–2.69 (2.65). **Pedipalps** stocky with short, tuberculate ventral extensions on femora and genua. Palpomeres: trochanter (47.5–47.5 (47.5) long); femur (97.5–100 (97.5) long); genu (62.5–62.5 (62.5) long); tibia (65–67.5 (67.5) long; 25–26.25 (25) wide); tarsus (16.25–17.5 (16.25) long). Palpomere proportions: femur/genu 1.56–1.60 (1.56); tibia/femur 0.65–0.69 (0.69); tibia length/width 2.48–2.70 (2.70).

Venter — (640–680 (640) long; 440–495 (495) wide) with faint reddish-purple coloration. Gnathosomal bay (170–175 (170) long; 70–75 (70) wide). Cxgl-4 subapical. **Medial suture** (55–75 (55) long). **Genital plates** (140–150 (140) long; 130–140 (130) wide). Additional measurements: Cx-1 (290–300 (300) long (total); 110–135 (135) long (medial)); Cx-3 (325–360 (360) wide); anterior venter (195–210 (200) long). Ventral proportions: gnathosomal bay length/width 2.33–2.50 (2.43); anterior venter/genital field length 1.37–1.43 (1.43); anterior venter length/genital field width 1.50–1.54 (1.54); anterior venter/medial suture 2.60–3.64 (3.64).

IMMATURES unknown.

Etymology. Specific epithet (*whitneyae*) named in honor of Whitney Nelson, one of two students (including JRF) of APGD studying water mite taxonomy for their doctoral studies.

Distribution. Southern Appalachians (Figure 275).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola whitneyae* and therefore this species is not included in our phylogenetic analyses. However, we were able to examine morphology with material preserved in GAW. The overall similarity, distribution in the east, and fusion of the dorso-lateral platelets to the dorsal plate, are consistent with placing this species in the Rusetria Complex and within the Eastern 2-Plate Identification Group.

Torrenticola wiedenmanni Fisher & Dowling, sp. n. http://zoobank.org/76706F18-6CDE-4A99-93C2-76BBE372E10A

Material examined. HOLOTYPE (\bigcirc): from USA, California, Monterey County, beside Rt. 1 south of Gorda, south side of Salmon Creek, (35°49'49"N, 121°22'22"W), 28 July 1987, by IM Smith, IMS870115.

Figure 278. Torrenticola wiedenmanni distribution.

PARATYPES (5 \bigcirc ; 4 O): California, USA: 1 O (ALLOTYPE) from Monterey County, beside Rt. 1 south of Gorda, south side of Salmon Creek, (35°49'49"N, 121°22'22"W), 28 July 1987, by IM Smith, IMS870115 • 1 \bigcirc and 1 O from San Bernardino County, Claremont; Mount Baldy; beside road 3.5 km east of Mount Baldy Village, (34°15'15"N, 117°39'39"W), 24 July 1987, by IM Smith, IMS870107 • 2 \bigcirc and 2 O from San Bernardino County, Lytle Creek Recreation Area off Rt. 15 west of Devore; Applewhite Picnic Grounds, (34°16'16"N, 117°30'30"W), 23 July 1987, by IM Smith, IMS870103 • 1 \bigcirc from Tulare County, beside Rt. 180 at Stony Creek Picnic Area east of Sequoia National Park boundary, (36°40'40"N, 118°50'50"W), 1 August 1987, by IM Smith, IM-S870124A • 1 \bigcirc from Ventura County, Ojai; beside Rt. 33 just above Wheeler Gorge Campground, (34°31'31"N, 119°16'16"W), 25 July 1987, by IM Smith, IMS870109B.

Type deposition. Holotype (\bigcirc) , allotype (\circlearrowright) , and some paratypes $(3 \bigcirc; 2 \circlearrowright)$ deposited in the CNC; other paratypes $(2 \heartsuit; 1 \circlearrowright)$ deposited in the ACUA.

Diagnosis. Torrenticola wiedenmanni is unlike all other western species by having this combination of characters: anterio-lateral platelets free (fused to dorsal plate in Rusetria Complex); colorless (dorsum with distinct coloration in Tahoei group, *T.* ventura, and *T. raptoroides*); distinct and complete hind coxal margins (incomplete in Rala Group, and *T. sharkeyi*); round body (rectangular or ovoid in Ellipsoidalis Group); unmodified rostrum (short and conical in *T. sierrensis*, *T. olliei*, *T. leviathan*, and *T. ellipsoidalis*); and tuberculate ventral extensions on pedipalpal genua (dentate and flanged in Miniforma group).

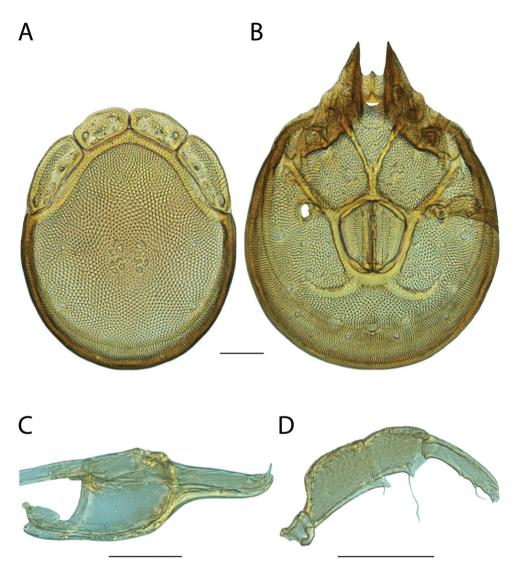

Figure 279. *Torrenticola wiedenmanni* sp. n. female: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = $100 \mu m$.

Description. FEMALE (Figure 279) (n = 5) (holotype measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (560–640 (610) long; 445–540 (530) wide) circular and colorless. Anterio-medial platelets (110–150 (135) long; 55–75 (67.5) wide). Anterio-lateral platelets (182.5–200 (190) long; 65–85 (80) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars and occasionally anterior to the muscle scars (distance between Dgl-4 295–350 (315)). Dorsal plate proportions: dorsum length/width 1.15–1.26 (1.15); dorsal width/distance between Dgl-4 1.33–1.73 (1.68); anterio-medial platelet length/width 2.00–2.11 (2.00); anterio-lateral platelet length/width 2.35–2.81 (2.38); anterio-lateral/anterio-medial length 1.31–1.66 (1.41).

Gnathosoma — **Subcapitulum** (302.5–355 (352.5) long (ventral); 222.5–267.5 (260) long (dorsal); 110–130 (120) tall) colorless. Rostrum (120–142.5 (142.5) long; 37.5–42.5 (40) wide). Chelicerae (310–385 (385) long) with curved fangs (47.5–50 (50) long). Subcapitular proportions: ventral length/height 2.73–2.94 (2.94); rostrum length/width 3.20–3.56 (3.56). **Pedipalps** with tuberculate ventral extensions on femora and genua, with femora sharply taper proximally and tibial setae near tarsi. Palpomeres: trochanter (30–38.75 (36.25) long); femur (90–107.5 (102.5) long); genu (65–75 (72.5) long); tibia (72.5–87.5 (87.5) long; 17.5–21.25 (21.25) wide); tarsus (13.75–17.5 (16.25) long). Palpomere proportions: femur/genu 1.37–1.43 (1.41); tibia/femur 0.79–0.85 (0.85); tibia length/width 4.00–4.27 (4.12).

Venter — (710–810 (780) long; 560–630 (615) wide) colorless. Gnathosomal bay (132.5–160 (160) long; 62.5–65 (62.5) wide). Cxgl-4 subapical. **Medial suture** (40–60 (40) long). **Genital plates** (172.5–187.5 (180) long; 150–165 (155) wide). Additional measurements: Cx-1 (270–320 (320) long (total); 140–162.5 (162.5) long (medial)); Cx-3 (330–385 (380) wide); anterior venter (200–235 (220) long). Ventral proportions: gnathosomal bay length/width 2.42–2.56 (2.56); anterior venter/genital field length 1.16–1.25 (1.22); anterior venter length/genital field width 1.32–1.42 (1.42); anterior venter/medial suture 3.92–5.50 (5.50).

MALE (Figure 280) (n = 4) (allotypic measurements in parentheses when available) with characters of the genus with following specifications.

Dorsum — (560–610 (575) long; 470–515 (480) wide) circular and colorless. Anterio-medial platelets (130–140 (135) long; 62.5–70 (65) wide). Anterio-lateral platelets (165–195 (180) long; 70–75 (75) wide) free from dorsal plate. Dgl-4 approximately halfway between the edge of the dorsum and the muscle scars and occasionally anterior to the muscle scars (distance between Dgl-4 285–315 (300)). Dorsal plate proportions: dorsum length/width 1.18–1.20 (1.20); dorsal width/distance between Dgl-4 1.54–1.67 (1.60); anterio-medial platelet length/width 2.00–2.08 (2.08); anterio-lateral platelet length/width 2.20–2.60 (2.40); anterio-lateral/anterio-medial length 1.27–1.39 (1.33).

Gnathosoma — **Subcapitulum** (307.5–345 (325) long (ventral); 225–257.5 (240) long (dorsal); 107.5–117.5 (107.5) tall) colorless. Rostrum (125–140 (130) long; 35–40 (37.5) wide). Chelicerae (335–357.5 (345) long) with curved fangs (45–50 (45) long). Subcapitular proportions: ventral length/height 2.80–3.02 (3.02); rostrum length/width 3.33–3.57 (3.47). **Pedipalps** with tuberculate ventral extensions on femora and genua, femora sharply taper proximally and tibial setae near tarsi. Palpomeres: trochanter (32.5–35 (32.5) long); femur (90–100 (90) long); genu (65–72.5 (65) long); tibia (75–80 (75) long; 20–20 (20) wide); tarsus (13.75–15 (15) long). Palpomere proportions: femur/genu 1.36–1.38 (1.38); tibia/femur 0.80–0.89 (0.83); tibia length/width 3.75–4.00 (3.75).

Venter — (690–755 (715) long; 465–590 (465) wide) colorless. Gnathosomal bay (140–152.5 (145) long; 55–60 (60) wide). Cxgl-4 subapical. **Medial suture** (70–85 (80) long). **Genital plates** (145–155 (150) long; 115–125 (117.5) wide). Additional

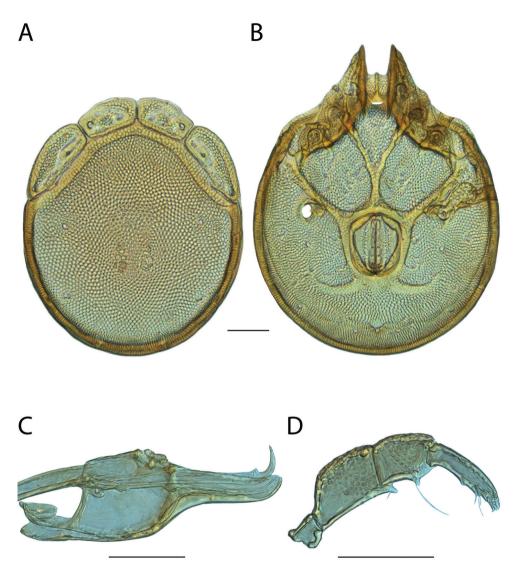

Figure 280. *Torrenticola wiedenmanni* sp. n. male: **A** dorsal plates **B** venter (legs removed) **C** subcapitulum **D** pedipalp (setae not accurately depicted). Scale = 100 μm.

measurements: Cx-1 (280–300 (300) long (total); 140–160 (160) long (medial)); Cx-3 (335–370 (345) wide); anterior venter (230–262.5 (260) long). Ventral proportions: gnathosomal bay length/width 2.42–2.64 (2.42); anterior venter/genital field length 1.53–1.73 (1.73); anterior venter length/genital field width 1.92–2.21 (2.21); anterior venter/medial suture 3.09–3.29 (3.25).

IMMATURES unknown.

Etymology. Specific epithet (*wiedenmanni*) named in honor of Rob Wiedenmann, Professor of Entomology at University of Arkansas, whose advice, guidance, and friendship to JRF was an inspiration in how to be a true mentor—lessons that JRF anticipates paying forward to his own students someday.

Distribution. Southern California (Figure 278).

Remarks. Unfortunately, we were unable to acquire fresh material of *Torrenticola wiedenmanni* and therefore this species is not included in our phylogenetic analyses, but we were able to examine morphology with material preserved in GAW. However, due to its unique set of characteristics, we are unable to place this species into a species complex or an identification group.

Key to Torrenticola of the United States and Canada

Species Groups are placed within key to aid identification. However, not all groups are included and some appear multiple times (Ellipsoidalis Group; male members of the Elongata, Rala, Raptor, and Tricolor Groups).

Known only from females: *T. occidentalis*; *T. elusiva*; *T. welbourni* Known only from males: *T. bittikoferae*; *T. longitibia*; *T. dolichodactyla*; *T. anoplopalpa*

1	Female: genital field pentagonal (a); medial suture usually short (b), oc-
	casionally long (c), but never as long as conspecific male2
_	Male: genital field rectangular (aa); medial suture long (bb, cc)
2 (1)	Dorso-lateral platelets entirely (a) or partially (b) fused to dorsal plate; hind coxal
	margin indistinct (c); subcapitulum unmodified (d)
_	Dorso-lateral platelets free from dorsal plate (aa); hind coxal margin in-
	distinct (c) or distinct (cc); subcapitulum unmodified (d) or modified
	(e.g., dd)
3 (2)	Medial suture present (a)*4
_	Medial suture absent (aa)*Eastern 2-Plates (in part)17
	*T. magnexa and T. sellersorum key in both directions
4 (5)	Western (west of 100 th Meridian)* (a); dorsal coloration indistinct (b) or
	colorless (c)
_	Eastern (east of 100^{th} Meridian)* (aa); dorsal coloration distinct (except <i>T</i> .
	folkertsae) (bb) Eastern (in part) & Partial 2-Plates9
	* <i>T. sellersorum</i> keys in both directions
5 (6)	Shorter anterior venter (120–143) and subcapitulum ventral length/width
	= 2.05–2.17; dorsal pattern of eastern specimens distinctive, but specimens
	from New Mexico with standard pattern (i.e., without distinctive shape of
	posterior portion); mostly eastern, but also known from Manitoba, South
	Dakota, and New Mexico T. sellersorum sp. n.
_	Longer anterior venter (145-178) (but 140-159 in T. walteri), and/or
	subcapitulum ventral length/width = 2.21–2.47 (but 2.14–2.4 in T. mul-
	<i>leni</i>); western

6 (5)	Dorsum larger (690 long, 500 wide); pedipalpal tibia length/width = 3.7 ; dorsum with faint coloration and separated into anterior and posterior portions; single specimen from Wilson Creek, Trinity County, California
_	T. welbourni sp. n. Dorsum smaller (570–645 long, 420–480 wide); pedipalpal tibia length/ width = 3.0–3.4; dorsum coloration variable
7 (6)	Medial suture longer (20.0–22.5); dorsum with faint coloration and separated into anterior and posterior portions; Rocky Mountains
_	Medial suture shorter (10.0–12.5); coloration variable; California & Oregon
8 (7)	Pedipalpal femur/genu = 1.52–1.64; anterio-medial platelets less elongate, length/width = 2.58–2.72; dorsal coloration usually orange and usually separated anteriorly and posteriorly; California, Oregon, & British Co-
_	lumbia
9 (4)	Dorsum more elongate, length/width = $1.6-1.8$; anterior venter/genital field width = $1.25-1.33$; southern Appalachians <i>T. microbiscutella</i> sp. n.
_	Dorsum more ovoid, length/width = $1.1-1.5$; anterior venter/genital field width = $0.74-1.13$
10 (9)	Dorsal coloration diagnostic, with large dark spot anteriorly and adjoining red spot posteriorly; surface sculpturing, at least on dorsum, with pits large and distinct; dorsum usually shorter (540–580); southeastern (Mississippi & Alabama)
_	Dorsal coloration not as above; surface pits not as large and distinct as above; dorsum usually longer (600–810) (540–650 in <i>T. sellersorum</i>)11
11 (10)	Pedipalpal tibia more elongate, length/width = $4.5-4.9$; dorsal coloration with faint, diffuse darkening centrally; known only from Coos County, New Hampshire
_	Pedipalpal tibia less elongate, length/width = 3.0–4.2; dorsal coloration bold
12 (11)	Dorsal coloration distinctive, with bluish color separated into anterior and posterior portions and with central stripe bold red; known only from Pope County, Indiana
_	Dorsal coloration not as above, especially with central reddish stripe, when present, not as bold
13 (12)	Dorsum rounder, length/width = 1.19–1.21; pedipalpal tibia usually more elongate, length/width = 3.9–4.2; dorsal coloration with anterior and posterior portions connected medially; eastern (New Hampshire & Texas)

- 14 (13)	Dorsum more ovoid, length/width = $1.23-1.42$; pedipalpal tibia usually less elongate, length/width = $3.0-3.8$, except <i>T. magnexa</i> ($3.2-4.0$), which has a stockier rostrum ($2.2-3.0$ in <i>T. magnexa</i> ; $3.1-3.4$ <i>T. priapus</i>)14
14 (13)	Dorso-lateral platelets only partially fused to dorsal plate; dorsum longer (680–810); pedipalpal tibia longer (102–113); dorsal coloration highly variable in color (bluish, orange, or reddish) and pattern (anterior and posterior portions separated or connected; or dorsum uniformly purple); widespread in the east
_	Dorso-lateral platelets entirely fused with dorsal plate; dorsum smaller
15 (14)	(540-670); pedipalpal tibia shorter $(72-95)$ 15 Rostrum stockier (length/width = 2.44–2.68); anterior venter/genital field width = 0.74–0.80; dorsal pattern often distinctive, with bold dark colora- tion separated into anterior and posterior portions and posterior portion not reaching the posterior of the dorsal plate and not encompassing the muscle scars; mostly eastern, but also found west of the 100 th Meridian
_	<i>T. sellersorum</i> sp. n. Rostrum more elongate (length/width = 3.00–3.31); anterior venter/geni-
16 (15)	tal field width = 0.86–1.11; dorsal pattern not as above
_	tions with orange stripe medially; Alabama & Tennessee <i>T. tysoni</i> sp. n. Pedipalpal tibia less elongate, length/width = $3.0-3.1$; genital field wider (168–173); dorsal coloration with anterior and posterior portions connected medially; known only from Washington County, Maine
17 (3)	<i>T. pendula</i> sp. n. Dorsal pattern distinctive, with bold dark coloration separated into anterior and posterior portions and posterior portion not reaching the posterior of the dorsal plate and not encompassing the muscle scars; mostly eastern,
_	but also found west of the 100^{th} Meridian <i>T. sellersorum</i> sp. n. Dorsal pattern not as above, when similar, posterior portion encompasses
18 (17)	muscle scars; east of the 100 th Meridian
_ 19 (18)	Genital field shorter (150–170)
_	gia <i>T. feminellai</i> sp. n. Dgl-4 closer to edge of dorsum, dorsum width/distance between Dgl-4 = 1.26–1.48; rostrum usually more elongate, length/width = 3.05–3.38,
20 (19)	except <i>T. magnexa</i> (2.75–3.00)

	io-lateral platelets partially fused to dorsal plate; widespread in the east
_	T. magnexa Anterior venter/genital field width = 0.66–0.83; anterio-lateral platelets
21 (20)	fused or partially fused to dorsal plate
_	Dorsal coloration highly variable, reddish-purple to purple (occasionally bluish) separated into anterior and posterior portions (rarely connected medially, but if so, then only faintly); dorsum length/width = 1.38–1.44; pedipalpal tibia length/width = 2.92–3.61; lotic (fast-moving streams); Appalachians
_	Dorsal coloration bold, dark purple, anterior and posterior portions con- nected medially; dorsum length/width = 1.26–1.38; pedipalpal tibia length/width = 2.42–2.95; lotic (fast-moving streams); southern Appala- chians (North Carolina)
22 (18)	Dorsal coloration either reddish- or bluish-purple, prominent, and with anterior and posterior portions separate; genital field width 152.5–165.0; subcapitular ventral length 317–335; eastern (Missouri, New Brunswick, and Tennessee)
-	Body distinctive for having a bluish tinge, dorsal coloration bluish, with anterior and posterior portions connected medially; genital field width 120–145.0; subcapitular ventral length 310–330; known only from an upper tributary of Factory Creek, Wayne County, Tennessee
_	Dorsal coloration bluish and bold, with anterior and posterior portions sep- arate, exposing red medially; genital field width 142.5–160; subcapitular ventral length 290–315; Interior Highlands (Arkansas and Missouri) <i>T. biscutella</i> sp. n.
23 (2)	Dgl-4 further from edge of dorsum, dorsum width/distance between Dgl- 4 = 1.80–3.30; dorsum rounder, length/width = 1.16–1.31; east of the Rocky Mountains
_	Dgl-4 closer to edge of dorsum, dorsum width/distance between Dgl-4 = 1.17–1.73; body variable; eastern or western
24 (23)	Anterior venter longer (205–240); subcapitulum more elongate, ventral length/height = $2.98-3.18$; pedipalpal tibia more elongate, length/width = $6.0-7.6$; dorsal coloration restricted posteriorly, usually with anterior extension; Appalachians
_	Anterior venter shorter (150–200); subcapitulum less elongate, ventral length/height = 2.26–2.90; pedipalpal tibia less elongate, length/width = 4.0–6.0; dorsal coloration variable

25 (24)	Dgl-4 closer from edge of dorsum, dorsum width/distance between Dgl-4
	= 1.8–2.1; dorsal coloration separated into anterior and posterior portions;
	east of Rocky Mountains
-	Dgl-4 further from edge of dorsum, dorsum width/distance between Dgl- $(1, 2, 2, 3, 3)$ dorsel externation variables. Appeloshions
26(25)	4 = 2.2-3.3; dorsal coloration variable; Appalachians
26 (25)	Rostrum less elongate, length/width = $2.7-3.2$; femoral tubercles shorter
	(12–14); dorsal coloration reddish and usually centralized, but occasion-
	ally resembling <i>T. raptor</i> ; eastern, not known from mountain streams
	<i>T. gnoma</i> sp. n.
-	Rostrum more elongate, length/width = $3.5-4.3$; femoral tubercles longer
27(26)	(15–25), except for T. <i>ivyae</i> (13–17); dorsal coloration variable
27 (26)	Anterior venter longer (180–195); dorsal coloration with anterior and pos- torior reveally connected, north cost T michinian T
	terior usually connected; northeast
- (27)	Anterior venter shorter (152–170); dorsal coloration variable
28 (27)	Rostrum more elongate, length/width = $4.0-4.2$; anterior venter/medial
	suture = $6-7$; dorsal coloration purple posteriorly that extends anteriorly
	to the anterio-medial platelets; Florida
_	Rostrum less elongate, length/width = $3.5-3.9$; anterior venter/medial su-
29 (28)	ture = 8–10; dorsal coloration variable; Appalachians 29 Pedipalpal femoral tubercles shorter (17.50); subcapitulum ventral length/
29 (20)	height = 2.39 ; dorsal coloration restricted posteriorly with anterior exten-
	· · ·
	sion, venter colorless; single specimen from Charlotte County, New Brun-
	swick
_	height = $2.48-2.73$; dorsal coloration separated into anterior and posterior
	portions, venter coloration bold; known from Tennessee and Virginia
	<i>T. racupalpa</i> sp. n.
30 (23)	Rostrum strongly upturned; subcapitulum (including rostrum) expanded
50 (25)	laterally, nearly square in cross-section; eastern Erectirostra Group31
_	Rostrum usually straight, occasionally upturned distally or rarely slightly
	upturned (<i>T. reduncarostra</i>); subcapitulum unmodified, usually laterally
	compressed, at least not square in cross-section; eastern or western
31 (30)	Rostrum length/width = $1.57-1.62$; dorsal coloration faint to absent; Se-
51 (50)	vier County, Tennessee
_	Rostrum length/width = $1.72-2.09$; dorsal coloration bolder
32 (31)	Anterio-lateral platelets less elongate, length/width = $2.52-2.69$; Appala-
52 (51)	chians
_	Anterio-lateral platelets more elongate, length/width = 2.96–3.00; Ouach-
	itas (Arkansas & Oklahoma)
33 (30)	Dorsal plate with anterio-medial extension covering nearly half the length of
	the anterio-medial platelets; pedipalpal femur with large, tuberculate ventral
	extension and genu without ventral extension

_	Dorsal plate without anterior extension; pedipalpal ventral extensions not as above (femoral tubercle never as pronounced; if genu without ventral extension, then femoral extension either absent or lamellate)
34 (33)	Rostrum dorsally with patch of strong dentation; southern Appalachians <i>T. dentirostra</i> sp. n.
-	Rostrum without dentation; eastern or western
35 (34)	Pedipalpal tibia more elongate, length/width = 5.3–5.9; dorsum short (475–530); dorsal coloration purple posteriorly
-	Pedipalpal tibia less elongate, length/width = 1.7–5.0; dorsum variable (495–900); coloration variable
	*except for <i>T. dentirostra</i> (couplet 34) and <i>T. flangipalpa</i> (couplet 66)
36 (35)	Dorsum larger $(500-530)$; gnathosomal bay length/width = $1.52-1.55$;
50 (55)	subcapitulum ventral length/width = 3.00-3.14; dorsum lacking reddish
	coloration; eastern
-	Dorsum smaller (475–500); gnathosomal bay length/width = $1.30-1.50$;
	subcapitulum ventral length/width = $3.14-3.30$; dorsum with reddish col-
27(25)	oration just anterior to purple; Ouachitas (Arkansas) <i>T. solisorta</i> sp. n.
37 (35)	Hind coxal margin indistinct or incomplete
-	Hind coxal margin distinct and complete
38 (37)	Gnathosomal bay elongate (a), length/width = $4.4-5.4$; pedipalpal tibia less elongate, length/width = $1.7-2.0$; pedipalpal femur and genu without
	ventral extensions; southwestern
_	Gnathosomal bay unmodified (aa), length/width = 1.3–2.8; pedipalpal tibia
	more elongate, length/width = 2.7–5.0; pedipalpal femur with ventral exten-
	sion and genu with or without ventral extension; eastern or western 40
39 (38)	Dorsum elongate, length/width = 1.53–1.82; pedipalpal femur/genu = 1.04–1.17; subcapitulum less elongate, ventral length/width = 1.96;
	known only from Catron County, New Mexico
_	Dorsum ovoid, length/width = 1.29–1.34; pedipalpal femur/genu = 1.3–
	1.5; subcapitulum more elongate, ventral length/width = 2.5–2.7; Arizona and Mexico
40 (38)	Rostrum short and conical, length/height = 1.70–1.83; pedipalpal tibia
10 (50)	short and thick, length/width = 2.75-2.88; body colorless; known from
	Arizona and New Mexico
-	Rostrum unmodified, length/width = $2.45-3.8$; pedipalpal tibia unmodi-
	fied, length/width = 3.0–5.0; body coloration variable
41 (40)	Pedipalpal femur with large flanged ventral extension, and pedipalpal genu
	either with flanged, dentate ventral extension, or without ventral exten-
	sion; subcapitulum ventral length/width = 3.0–3.5; southwestern
_	Pedipalpal femur and genu with tuberculate ventral extensions; subcapitu- lum ventral length/width = 2.0–2.9; eastern or western

42 (41)	Pedipalpal femur with large flanged ventral extension that extends to at least mid-length of genu, and genu without ventral extension; dorsum
_	more elongate, length/width = 1.4–1.6
43 (41)	Hind coxal margins distinct and complete; dorsal coloration restricted to
15 (11)	a single dark spot anteriorly with an orange spot posterior to the dark spot
	(similar only to <i>T. unimaculata</i> and <i>T. ululata</i>); known only from Tyler
	County, Texas
-	Hind coxal margins instinct or incomplete; dorsal coloration not as above 44
44 (43)	Pedipalpal tibia longer (100.0-107.5); dorsal coloration faint, restricted
	posteriorly; Catron & Grant Counties, New Mexico T. sharkeyi sp. n.
-	Pedipalpal tibia shorter (80.0–95); dorsal coloration variable; eastern or
45 (44)	Pacific northwest
45 (44)	Pedipalpal femoral tubercle truncate; anterior venter shorter (140–152.5); dorsal coloration bold, reddish purple, and separated into anterior and
	posterior portions that are connected by yellowish band; Fayette & Somer-
	set Counties, Pennsylvania
-	Pedipalpal femoral tubercle conical; anterior venter longer (155-213);
	dorsal coloration variable; eastern or western
46 (45)	Pedipalpal tibia less elongate, length/width = 3.00–3.13; gnathosomal bay
	length/width = $2.4-2.8$; dorsal coloration bold purple, excepting platelets;
	known only from Curry County, Oregon
_	bay length/width = $1.3-2.2$; dorsal coloration bluish or reddish purple
	separated into anterior and posterior portions; eastern
	Eastern 4-Plates47
47 (46)	Anterior venter longer (202-213); subcapitulum shorter (112-120); col-
	oration bold; Appalachians (Tennessee & Pennsylvania)
-	Anterior venter shorter (155–190); subcapitulum taller (122–150); colora-
40 (47)	tion faint or bold
48 (47)	Pedipalpal tibia length/width = $3.9-4.2$; rostrum length/width = $3.25-3.85$; dorsal coloration bold, bluish-purple, and separated into anterior
	and posterior portions that may or may not be connected; Lauderdale
	County, Alabama
_	Pedipalpal tibia length/width = 3.2–3.6; rostrum length/width = 2.5–3.0;
	dorsal coloration variable
49 (48)	Genital field thinner (137–145); rostrum less elongate, length/width =
	2.5–2.7; dorsal coloration faint and bluish-purple; Appalachians (Tennes-
	see & Pennsylvania)

_	Genital field wider (145–160); rostrum more elongate, length/width=
50 (49)	2.8–3.1; dorsal coloration bold and reddish-purple 50 Body smaller (dorsum 550); female known from single specimen from Lit-
_	tle Flat Brook, Sussex County, New Jersey
51 (50)	Pedipalpal genu shorter (63.8); subcapitulum shorter, ventral length 310;
	rostrum shorter (126); anterio-medial platelets more elongate, length/
	width = 2.83; female known from a single specimen from Morris County, New Jersey
_	Pedipalpal genu longer (70.0–75.0); subcapitulum longer, ventral length
	330–355; rostrum longer (130–140); anterio-medial platelets less elon-
	gate, length/width = 2.33–2.54; southern Appalachians (Tennessee & Carolinas)
52 (37)	Rostrum short and conical, length/width = 1.60–2.42
-	Rostrum unmodified or elongate, length/width = 2.48–4.83 65 *except for <i>T. dimorpha</i> (couplet 33)
53 (52)	Pedipalpal femur and genu with tubercles absent or indistinct; pedipalpal
20 (21)	femur/genu = 1.72-1.79; colorless, or rarely with dorsum pinkish cen-
	trally; Wayne County, Indiana <i>T. hoosieri</i> sp. n.
_	Pedipalpal femur and genu with tubercles present and obvious; pedipal-
	pal femur/genu = 1.35–1.69, (except <i>T. leviathan</i> = 1.68–1.73); coloration variable
54 (53)	Dorsum colorless or with diffuse coloration conforming to the standard
	pattern for most Torrenticola, separated into anterior and posterior por-
	tions; eastern or western
- 55 (54)	Dorsum colorful, adorned with distinctive patterning; eastern 60 Pedipalpal tibia more elongate, length/width = 3.9–4.2; known only from
))()1)	Mendocino County, California
_	Pedipalpal tibia less elongate, length/width = 2.9–3.5; eastern or western 56
56 (55)	Pedipalpal femur/genu = 1.60–1.69; Interior Highlands <i>T. pearsoni</i> sp. n.
	Pedipalpal femur/genu = 1.32–1.55; western
57 (56)	Dorsum rectangular; anterio-medial platelets square-shaped, length/width = 1.4–1.7; widespread in the west
_	Dorsum ovoid or round; anterio-medial platelets more rectangular, length/
	width = 1.9–2.5
58 (57)	Rostrum very short, length/width = 1.62–1.76; subcapitulum taller, ven-
	tral length/height = $1.78-1.92$; dorsum colorless, or with faint coloration
	separated into anterior and posterior portions; British Columbia, Oregon, & California
_	Rostrum more elongate, length/width = 1.96–2.15; subcapitulum unmod-
	ified, ventral length/height = $2.18-2.39$

59 (58)	Anterio-lateral platelets/anterio-medial platelets = 1.62; rostrum length/
	width = 2.15; known from single specimen collected from trout stomachs
	in Wyoming
-	Anterio-lateral platelets/anterio-medial platelets = 1.18–1.27; rostrum
	length/width = 1.96–2.08; widespread in the west
60 (54)	Dorsal coloration diagnostic, with dark anterior portion nearly restricted
	to anterio-medial platelets, either with or without dark posterior spot, and
	with dark portions connected by bold red stripe; body more elongate, dor-
	sum more ovoid, length/width = 1.41–1.54; Polk & Montgomery Coun-
	ties, Arkansas
-	Dorsal coloration variable, but not as above; body rounder, dorsum length/
	width = 1.20–1.39, except <i>T. cardia</i> (1.39–1.47) 61
61 (60)	Dorsal coloration diagnostic, with single dark, bell-shaped spot anteriorly,
	with bold red posteriorly (similar only to <i>T. ululata</i> and <i>T. kringi</i>); Arkan-
	sas & New Brunswick T. unimaculata sp. n.
-	Dorsal coloration variable, but never as above
62 (61)	Dorsal coloration diagnostic, with three dark spots (two posterior, one an-
	terior); widespread east of the 100th Meridian T. trimaculata
-	Dorsal coloration variable, but never with three separate spots
63 (62)	Dorsal coloration diagnostic, restricted to a dark stripe anteriorly; rostrum
	less elongate, length/width = 1.8–2.0; known only from Aroostook Coun-
	ty, Maine <i>T. mohawk</i> sp. n.
-	Dorsal coloration not as above; rostrum more elongate, length/width =
	2.1–2.5
64 (63)	Dorsal coloration variable, but diagnostic, often appearing as two posterior
	spots and an anterior spot that are merged together, occasionally ante-
	rior spot is reduced to a stripe connected to the posterior spots; dorsum
	rounder, length/width = 1.20–1.35; subcapitulum ventral length/width =
	2.15–2.42; Appalachians
_	Dorsal coloration with reddish-purple, bluish-purple, or orange spot me-
	dially extending in a strip anteriorly often to the anterio-medial platelets;
	dorsum more ovoid, length/width = 1.39-1.47; subcapitulum ventral
	length/width = 2.04–2.12; Appalachians <i>T. cardia</i> sp. n.
65 (52)	Pedipalpal tibia more elongate, length/width = 4.4–5.066
-	Pedipalpal tibia less elongate, length/width = 2.5–4.368
66 (65)	Anterior venter longer (235–255); dorsum shorter (530–580); subcapitu-
	lum ventral length/width = 3.4–3.5; southeastern <i>T. flangipalpa</i> sp. n.
-	Anterior venter shorter (150–195); dorsum longer (610–690); subcapitu-
	lum ventral length/width = 2.2–2.7
67 (66)	Anterior venter/medial suture = 10-17; rostrum less elongate, length/
	width = 3.17–3.38; dorsal coloration bluish purple, restricted posteriorly;
	Arizona & New Mexico
-	Anterior venter/medial suture = 6–8; rostrum more elongate, length/width
	= 3.44–3.75; dorsal coloration reddish-purple posteriorly, extending ante-

	riorly to the edge of the dorsal plate; Floyd & Chattooga Counties, Geor-
	gia <i>T. danielleae</i> sp. n.
68 (65)	Anterior venter longer (250–340)*
-	Anterior venter shorter $(150-235)^*$
	* <i>T. oregonensis</i> (230–270) key in both directions

_	Subcapitulum ventral length/width = 1.60-3.22; dorsum coloration vari-
	able*143
139 (138)	* <i>T. oliveri</i> (3.10–3.34) key in both directions Pedipalpal femur/genu = 1.94; pedipalpal tibia shorter (47.5); single speci-
109 (100)	men from Catron County, New Mexico
-	Pedipalpal femur/genu = 1.3–1.8; pedipalpal tibia longer (62–93) 140
140 (139)	Gnathosomal bay more elongate, length/width = 2.14–2.40; pedipalpal femur/genu = 1.34–1.40; dorsal coloration diffuse purple, not restricted
	posteriorly; Pacific Ranges
_	Gnathosomal bay less elongate, length/width = 1.27-2.04; pedipalpal fe-
	mur/genu = 1.43–1.79; dorsal coloration purple restricted posteriorly or
141 (142)	colorless
111 (112)	rior venter/genital field width = $3.2-3.7$; east of the Mississippi River
_	Pedipalpal tubercles prominent; pedipalpal tibia length/width = $3.6-5.2$;
142 (141)	anterior venter/genital field width = 1.9–2.8 142 Body smaller (dorsum: 485–510 long; 340–370 wide); anterior venter
()	shorter (247–265); anterio-medial platelets more elongate, length/width
	= 2.4–2.7; pedipalpal tibia more elongate, length/width = 4.4–4.9; south-
	eastern <i>T. flangipalpa</i> sp. n.

_	Body larger (dorsum: 560-650 long; 400-460 wide); anterior venter
	longer (305-325); anterio-medial platelets less elongate, length/width =
	1.7-2.0; pedipalpal tibia less elongate, length/width = 3.6-4.2; western
	(not southwestern)
143 (138)	Pedipalpal tubercles, especially genual tubercle consisting of a dentate
	flange; dorsal coloration either purple that is usually restricted posteriorly,
	or absent; western
_	Pedipalpal tubercles, when present, conical, sometimes dentate; dorsal col-
	oration variable; eastern or western Miniforma Group111
144 (143)	Pedipalpal tibia elongate, length/width = 4.0-4.2; dorsum wider (445-
	470); Pacific Ranges
_	Pedipalpal tibia unmodified, length/width = 2.4-3.5; dorsum thinner
	(335–400)
145 (144).	Rostrum elongate, length/width = 4.7–4.9; genital field shorter (117–125);
	Pacific Ranges
_	Rostrum unmodified, length/width = 2.5–3.2; genital field longer (130–
	150)146
146 (145)	Pedipalpal tibia more elongate (3.19–3.38); Catron County, New Mexico
_	Pedipalpal tibia less elongate (2.38–2.94)147
147 (146)	Pedipalpal femoral tubercle broader and anteriorly-directed; anterior ven-
	ter/genital field width = 2.04–2.21; dorsal coloration usually absent, rarely
	with purple posteriorly; California & Oregon T. copipalpa sp. n.
_	Pedipalpal femoral tubercle more tuberculate and not anteriorly-directed;
	anterior venter/genital field width = 1.82–1.98148
148 (147)	Dorsum shorter (485); rostrum more elongate, length/width = 3.19; pe-
	dipalpal tibia less elongate, length/width = 2.38; dorsal coloration absent;
	female known from single specimen from Prairie Creek in Humboldt
	County, California T. miniforma
_	Dorsum longer (525–590); rostrum less elongate, length/width = 2.76–3.07;
	pedipalpal tibia more elongate, length/width = 2.47-2.94; dorsal coloration
	usually present, purple that is especially prominent posteriorly149
149 (148)	Dorsum thinner (335-350 wide); dorsal coloration purple posteriorly, usu-
	ally encroaching anteriorly nearly to the platelets, occasionally including the
	platelets; Rocky Mountains (Idaho & Montana)
-	Dorsum thicker (355-390 wide); dorsal coloration purple posteriorly, but
	usually not encroaching as far anteriorly; Oregon & Washington
150 (143)	Dorsum smaller (450-460 long; 265-270 wide) and elongate, length/
	width = 1.70; dorsal coloration purple and separated into anterior and
	posterior portions; Tishomingo County, Mississippi T. elongata sp. n.
_	Dorsum larger (480-850 long; 295-605 wide) and round or less elongate,
	length/width = 1.17–1.68; dorsal coloration variable151

151 (150)	Pedipalpal tubercles absent; dorsum colorless, or rarely with pinkish cen- trally; Wayne County, Indiana
-	Pedipalpal tubercles present; dorsal coloration variable152
152 (151)	Eastern (east of the 100 th Meridian, but including Texas and Saskatch- ewan)
_	Western (west of the 100 th Meridian) 170
153 (152)	Rostrum short and conical, length/width = 1.80–2.53 154 Rostrum unmodified, length/width = 2.67–3.5 161
– 154 (153)	
1)4(1)3)	Dorsum colorless
-	Dorsum patterned, usually with dark, bold color
155 (154)	Dgl-4 closer to edge of dorsum, dorsum width/distance between Dgl-4
	= 1.2–1.3; anterior venter/genital field width = 2.9–3.2; pedipalpal tibia more elongate, length/width = 3.1–3.3; lotic (streams); Interior Highlands
	(Missouri & Arkansas) <i>T. pearsoni</i> sp. n.
-	Dgl-4 further from edge of dorsum, dorsum width/distance between Dgl-
	4 = 1.6–1.7; anterior venter/genital field width = 2.3–2.5; pedipalpal tibia
	less elongate, length/width = 2.7-2.8; lentic (lakes); known only from
	Middle Bass Island, Lake Erie, Ottawa County, Ohio T. bittikoferae
156 (154)	Dorsal coloration diagnostic, with three dark spots (two posterior, one an-
	terior); east of the Rocky Mountains T. trimaculata
-	Dorsal coloration not as above157
157 (158)	Dorsal coloration diagnostic, with dark, bold, bell-shaped spot anteriorly and bold red posteriorly (similar only to <i>T. ululata</i> , which have anterio-
	lateral platelets fused to the dorsal plate, and T. kringi, which have more
	elongate rostra, length/width = 2.8–3.0); Arkansas & New Brunswick
	T. unimaculata sp. n.
_	Dorsal coloration not as above;
158 (157)	Dorsal coloration diagnostic, with dark anterior coloration nearly restricted to
	anterio-medial platelets, either with or without dark posterior spot, and with
	dark portions connected by bold red stripe; body elongate, dorsum length/
	width = 1.53–1.57; Polk & Montgomery Counties, Arkansas T. larvata
_	Dorsal coloration not as above; body more ovoid, dorsum length/width =
	1.23–1.44, except <i>T. cardia</i> (1.43–1.54) 159
159 (158)	Dorsum more elongate, length/width = $1.43-1.54$; gnathosomal bay more
	elongate, length/width = 1.85–1.93; dorsal coloration with dark spot poste-
	riorly connected to a faint spot anteriorly; Appalachians T. cardia sp. n.
_	Dorsum less elongate, length/width = 1.23-1.39; gnathosomal bay less
	elongate, length/width = 1.33–1.82 160
160 (159)	Rostrum more elongate, length/width = 2.3–2.5; dorsal coloration var-
. /	iable, but usually distinct, appearing as two large posterior spots and a
	smaller anterior spot that are all merged together (spot color varies from
	pinkish to dark), however, occasionally similar to <i>T. cardia</i> and <i>T. mohawk</i> ;
	Appalachians (Tennessee, South Carolina, Nova Scotia)

-	Rostrum less elongate, length/width = 2.0-2.2; dorsal coloration appear-
	ing as an anterior, diffuse, dark stripe, often expanded posteriorly; known
	only from Aroostook County, Maine
161 (153)	Pedipalpal tibia more elongate, length/width = 4.00–4.80 162
_	Pedipalpal tibia less elongate, length/width = 2.70–3.94165
162 (161)	Rostrum dorsally with patch of strong dentation; subcapitulum more
	elongate, length/width = 3.5-3.7; femur shorter (90-93); dorsal colora-
	tion purple and restricted posteriorly; southern Appalachians
	T. dentirostra sp. n.
_	Rostrum without dentation; subcapitulum less elongate, length/width =
	2.5–2.9; femur longer (100–124); dorsal coloration variable, but not re-
	stricted posteriorlyRaptor Group (in part)163
163 (162)	Pedipalpal tibia shorter (80–83); rostrum length/width = 3.43–3.57; dor-
	sal coloration reddish-purple posteriorly, extending anteriorly to the edge
	of the dorsal plate; Floyd & Chattooga Counties, Georgia
_	Pedipalpal tibia longer (87–110); rostrum length/width = 2.81–3.38.164
164 (163)	Subcapitulum dorsal length longer (247–255); pedipalpal tibia/femur =
(- /	0.76-0.77; dorsum more ovoid, length/width = $1.31-1.34$; dorsal colora-
	tion reddish-purple; known only from Clay County, Alabama
	<i>T. daemon</i> *sp. n.
_	Subcapitulum dorsal length shorter (207–240); pedipalpal tibia/femur
	= $0.81-0.91$; dorsum rounder, length/width = $1.26-1.30$; dorsal colora-
	tion variable, but usually dark, bold bluish-purple; eastern, but not known
	from south of Kentucky (east of Mississippi River) T. irapalpa* sp. n.
	* <i>T. daemon</i> and <i>T. irapalpa</i> are best differentiated using female specimens
165 (161)	Pedipalpal femur/genu = $1.3-1.5$; dorsum rounder, length/width = $1.19-$
- ()	1.30; dorsal coloration restricted to a single dark spot anteriorly with an
	orange spot posterior to the dark spot (similar only to T. unimaculata and
	<i>T. ululata</i>); known only from Tyler County, Texas
_	Pedipalpal femur/genu = 1.6–1.9; dorsum more ovoid, length/width =
	1.32-1.68; dorsal coloration separated into anterior and posterior por-
	tions
166 (165)	Rostrum upturned; rostrum more elongate, length/width = 3.54–3.73; pedi-
	palpal tibia length/width = 2.70–3.11; Appalachians <i>T. reduncarostra</i> sp. n.
_	Rostrum straight; rostrum more elongate, length/width = 2.67–3.50; pe-
	dipalpal tibia length/width = 3.14–3.94 167
167 (166)	Dorsum elongate, dorsal length/width = 1.54–1.58; pedipalpal tibia
	shorter (62-73); dorsal coloration either reddish-purple separated into
	anterior and posterior portions, or diagnostic, dark blue with red oval
	medially; red morph from Appalachians (Tennessee, South Carolina,
	New Brunswick); dark morph known only from Tellico River in Monroe
	County, Tennessee

_	Dorsum ovoid, dorsal length/width = 1.32–1.50; pedipalpal tibia longer (77–
	88); dorsal coloration separated into anterior and posterior portions, bluish or reddish purple sometimes with faint orange medially; eastern
168 (169)	Rostrum more elongate, length/width = 3.00–3.13; medial suture (55–70);
_	known only from Haywood County, North Carolina
	eastern
169 (168)	Anterior venter shorter (220-240); genital field shorter (132-138); ante-
	rio-medial platelet length/width = 2.45–2.72; Montgomery & Newton
	Counties, Arkansas
_	Anterior venter longer (267.5–290); genital field longer (145–160); anterio- model platelet longth (width $= 2.08, 2.46$); agetern T use ground are n
170 (152)	medial platelet length/width = 2.08–2.46; eastern <i>T. neoanomala</i> sp. n. Rostrum less elongate, length/width = 1.8–2.2
_	Rostrum more elongate, length/width = $2.5-3.2$
171 (170)	Subcapitulum more elongate, ventral length/width = $2.2-2.5$; dorsum
	rounder, length/width = 1.17–1.28; dorsal coloration usually orangish and
	separated into anterior and posterior portions, occasionally very faint to
	colorless, rarely darker
-	Subcapitulum less elongate, ventral length/width = $1.6-2.0$; dorsum more
172 (171)	ovoid, length/width = 1.33–1.67 172 Dorsum longer (725–850); pedipalpal femur longer (92.5–100); rostrum
1/2(1/1)	more elongate, length/width = $1.86-2.02$; dorsum colorless or nearly so;
	widespread in the west
_	Dorsum shorter (560–640); pedipalpal femur shorter (75–78); rostrum
	short, length/width = 1.56-1.81; dorsum colorless, or with faint colora-
	tion separated into anterior and posterior portions; British Columbia, Or-
172 (172)	egon, & California
173 (172)	Pedipalpal tibia less elongate, length/width = $2.9-3.5$
_ 174 (173)	Pedipalpal tibia more elongate, length/width = 3.7–4.8 176 Dorsum longer (665–790); subcapitulum less elongate, ventral length/
1/1(1/3)	width = $2.1-2.4$; dorsal coloration orangish-pinkish; widespread through-
	out the west
_	Dorsum shorter (540-640); subcapitulum more elongate, ventral length/
	width = 2.5–3.0; California & Oregon175
175 (174)	Hind coxal margins distinct and complete; dorsum more ovoid, length/
	width = $1.4-1.6$; anterior venter/ genital field length = $2.0-2.3$; subca-
	pitulum ventral length shorter (300–335); dorsal coloration bluish-purple divided into anterior and posterior portions, often faint, and connected by
	red band; California & southwestern Oregon
_	Hind coxal margins indistinct or incomplete; dorsum rounder, length/
	width = 1.2–1.3; anterior venter/ genital field length = 1.2–1.5; subca-
	pitulum ventral length longer (355–375); dorsal coloration bright purple;
	known only from Curry County, Oregon

176 (173)	Dorsum longer (690-820); anterior venter/medial suture = 2.7-2.8; ros-
	trum less elongate, length/width = 2.5-2.8; dorsal coloration with faint
	purple restricted posteriorly; Oregon
-	Dorsum shorter (530-610); anterior venter/medial suture = 3.0-3.7; ros-
	trum more elongate, length/width = 2.9–3.6; southwest177
177 (176)	Pedipalpal tibia less elongate, length/width = 3.7–4.0; rostrum more elon-
	gate, length/width = 3.3–3.6; Dgl-4 further from edge of dorsum, dorsum
	width/distance between Dgl-4 = 1.54–1.67; dorsum colorless; southern
	California <i>T. wiedenmanni</i> sp. n.
-	Pedipalpal tibia more elongate, length/width = 4.2–4.8; rostrum less elon-
	gate, length/width = 2.9-3.1; Dgl-4 closer to edge of dorsum, dorsum
	width/distance between Dgl-4 = 1.34–1.43; dorsal coloration bluish pur-
	ple, restricted posteriorly; Arizona & New Mexico T. raptoroides sp. n.

Acknowledgements

We thank Ian Smith (CNC) for his expertise throughout the project and his magnanimous collection efforts; Andrea Radwell for teaching us water mite taxonomy, may she rest in peace; Joseph O'Neill for aiding in collection; the National Park Service, National Forests, and state parks that allowed collecting on their lands; and our friends and families that support us all. This material is based upon work supported by the National Science Foundation under Grant No. DEB 1134868.
