This mixed-methods study (<https://doi.org/10.1245/s10434-021-11209-1>) investigated changes in breast cancer care during the COVID-19 pandemic. The patients in the

study reported tangible changes in their care, including a transition to telehealth and care delays, and psychosocial concerns, including anxiety and depression.

Preliminary data was presented at American Society of Breast Surgeon's annual meeting in April 2021. The authors have no disclosures.
