

More specifically, moderate levels of total professional satisfaction were observed. Concerning the dimensions of satisfaction, low satisfaction rates were recorded in “salary”, “promotion” and in “privileges and benefits”. High satisfaction rates were recorded in “supervision by their superiors”, “cooperation between colleagues” and “the nature of their work”, while moderate satisfaction rates were reported in “communication” within facilities, as far as the explanation of tasks and objectives is concerned.

Conclusions: The results can be exploited by those with administrative and scientific responsibilities in the field of mental health in order to recognize nurses’ difficulties and solve their problems in psychosocial rehabilitation facilities.

Keywords: Psychosocial rehabilitation; mental health nurses; job satisfaction

Emotional intelligence as a factor in the efficient self-regulation of functional states under work strain

T. Zlokazova and A. Kuznetsova*

Faculty Of Psychology, Lomonosov Moscow state university, Moscow, Russian Federation

*Corresponding author.

doi: 10.1192/j.eurpsy.2021.1234

Introduction: Self-regulation of emotions is viewed as one of the key skills in various socio-economic professions (Kuznetsova & Titova, 2016; Spencer & Spencer, 2008), including psychology. Emotional intelligence (EI) can be seen as a vital competence for counseling psychologists, as well as a factor in an efficient human functional state’s (HFS) self-regulation under stressful work conditions.

Objectives: This study aims to assess the EI level in psychologists involved in a long-term relief programme for people affected by an industrial accident, and to reveal interrelations between EI and the efficiency of acquisition of new self-regulation skills.

Methods: The training course was designed for psychologists (n=15) in order to develop new stress-management counseling skills. It included: progressive relaxation, ideomotor and visualization exercises; autogenic formulae. Data were obtained from HFS evaluation questionnaires (Leonova, Zlokazova, Kachina & Kuznetsova, 2013), and the EI inventory (Manoylova, 2004).

Results: The mean EI level was high among the psychologists, although there were variations. Data confirmed rapid progress in the acquisition of self-regulation skills, and demonstrated a prolonged effect of stress ($p=0,052$) and fatigue ($p<0,001$) reduction (Friedman’s test). The EI level showed correlations (Spearman’s test) with HFS measures: by the end of the course psychologists with a higher EI reported higher psychological comfort ($p<0,05$) and lower acute fatigue ($p<0,01$) after relaxation exercises.

Conclusions: Although the sample size was small, the data, obtained from described above unique group of counseling psychologists, helped reveal the link between EI and efficient HFS self-regulation.

The watersports inclusion games - what are the benefits for volunteers?

A. O’Flynn^{1*}, J. Murphy² and E. Barrett³

¹Department Of Child And Adolescent Psychiatry, School Of Medicine, University College Dublin, Dublin, Ireland; ²Inclusion Games Officer, Irish Sailing, Dublin, Ireland and ³Child And Adolescent Liaison Psychiatry, Children’s University Hospital, Dublin, Ireland

*Corresponding author.

doi: 10.1192/j.eurpsy.2021.1235

Introduction: The Watersports Inclusion Games is an annual event organised by Irish Sailing and partners that provides an opportunity for individuals of all abilities across the physical, sensory, intellectual and learning spectrums and those experiencing barriers accessing mainstream sport to partake in a range of watersports. 79 volunteers from the 2019 cohort responded to a pilot survey to assess the benefits for volunteers at the event.

Objectives: This project aims to assess this data in the context of current knowledge about the benefits for volunteers in inclusive sport.

Methods: Literature review used the PEO keyword framework in medical and psychological databases, as well as grey literature. Data was collected using SurveyMonkey, quantitative data was analysed using Survey Monkey and SPSS, and qualitative themes were analysed using SurveyMonkey and Excel.

Results: Only one article exploring the benefits for volunteers in inclusive watersports was identified during literature review. This pilot survey analysis is the first on this topic in Ireland, and the largest sample of volunteers in inclusive watersport that we are aware of internationally. Thematic analysis finds that volunteers at this event are primarily motivated by altruistic motives, while the benefits they perceive include both personal enjoyment and growth, and seeing the enjoyment of other participants.

Conclusions: This project demonstrates that inclusive watersports can have many benefits for volunteers. The findings of this study can contribute to the evidence base on the benefits of inclusive sport for all those involved, while also identifying an opportunity for further study on volunteerism in inclusive sport, particularly adaptive watersports.

Conflict of interest: Ms O’Flynn reports a scholarship from the Health Research Board for this project, Dr Barrett has nothing to disclose, Ms Murphy reports to be the Inclusion Games Office, and thus responsible for the organisation of the Watersports Inclusion Games.

Protransition – an online-course for professionals to optimize the health care service for young people with mental illness in transition from adolescence to adulthood

E. König, S. Reetz*, U. Hoffmann and J. Fegert

Child And Adolescent Psychiatry/psychotherapy, University Hospital Ulm, Ulm, Germany

*Corresponding author.

doi: 10.1192/j.eurpsy.2021.1236

Introduction: Adolescent transitions to adulthood are a vulnerable phase for the development of mental illnesses. Additionally, there are often disruptions in psychiatric care delivery during the transition phase, potentially leading to a considerable treatment delay with a high risk of early chronification. Thus, the health care system and professionals in both child and adolescent psychiatry and adult psychiatry should be given greater consideration to the transition phase.

Objectives: The aim of the project ProTransition is the development of an online course for health care professionals to give in-depth knowledge of “transition psychiatry”, practical guidance and to sensitize them for the special challenges and needs of young adults with mental illness.

Methods: The online-course is being developed at the Department of Child and Adolescent Psychiatry/ Psychotherapy, Ulm and is expected to start in May 2021. It comprises e.g. special psychopathology of emerging adulthood, clinical interventions for adolescents with mental illness or legal aspects. An innovative and multididactical approach with specialized texts, case-studies, online-chats and interviews with experts and young people is applied. Additionally, user satisfaction with the online course will be evaluated.

Results: On the basis of the gained experiences, ideas for new transition-psychiatric treatment models will be derived. The accompanying research will point out the status quo and the course-related increasing knowledge of health care professionals regarding transition psychiatry. First results are expected in November 2021.

Conclusions: As transition psychiatry is facing great difficulties and challenges, professionals should be adequately educated. E-Learning offers a flexible and low-level approach to reach a broad target group.

Keywords: transition; E-Learning; adolescence; emerging adulthood

Implementation and evaluation of a mindfulness based program for children in a school setting in france

J. Monsillion*, R. Zebdi and L. Romo

Ea 4430 Clipsyd, Department Of Psychology, Université Paris Nanterre, Nanterre, France

*Corresponding author.

doi: 10.1192/j.eurpsy.2021.1237

Introduction: Mindfulness-based interventions (MBIs) held within an academic context continue to develop at an international scale, and continue to show benefits for children, specifically on cognitive functioning and emotional regulation (Theurel, Gimbert, Gentaz, 2018).

Objectives: The aim of this study is to demonstrate the relevance of implementing MBIs within French elementary school settings, in order to promote mental health, positive pedagogy and quality of life.

Methods: This study utilizes the Belgian program “Gestion des émotions par la pratique de la Pleine Conscience” (Emotional regulation using Mindfulness practices) (Deplus, 2015) and compares an experimental group participating in 9 MBI sessions to a control group “waiting list”. An interpretative phenomenological analysis at post-test investigates participant’s perception on the effects of the intervention on familial and school climates.

Results: The results of this study have been highly impacted by COVID19 (confinement). Quantitative results reveal that 33% of the participants (n=6) show a decrease in depressive symptoms, 33% show no change and 33% show a slight increase, post-intervention (T2). Results also suggest a decrease in anhedonia in 50% of the participants. 50% of participants show an improvement with regards to worrying and hypersensitivity. Qualitative analysis puts forth perceived improvements on emotional regulation and mindfulness abilities of participants, which has shown to have positive effects on familial climate.

Conclusions: We estimate that the implementation of such a MBI in a school setting will favour the development of executive functions and emotional regulation, allowing children to develop resilience towards stress and anxious-depressive affects. We also expect the intervention to help develop socio-emotional abilities and well-being in French schools.

Whole-patient conversations: Implementation of a practical positive psychiatry intervention for medical trainees

J. Lam^{1*}, M. Feingold-Link² and J. Noguchi³

¹Student, Warren Alpert Medical School, Providence, United States of America; ²Hospice/palliative Care, Warren Alpert Medical School, Providence, United States of America and ³Director For Service-learning And Community Mentoring, Warren Alpert Medical School, Providence, United States of America

*Corresponding author.

doi: 10.1192/j.eurpsy.2021.1238

Introduction: Positive psychiatry is the science and practice of psychiatry seeking to promote overall well-being and understand the “positive” aspects of the patient’s life, such as resilience, social connections, and meaning and values in life. While positive psychiatry research has recently blossomed, the field lacks practical ways to integrate these overarching principles into clinical practice. Life review interventions are commonly used in palliative care, spiritual care, and geriatrics, and involve a healthcare team member interviewing a patient about their life.

Objectives: Our objective is to describe the implementation of a positive psychiatry-informed life story review initiative into medical education, with the goal of creating a structure for medical trainees to see the larger context of patients’ health, understand how past experiences influence current values, and improve patients’ overall well-being.

Methods: First- and third-year students at Alpert Medical School of Brown University are required to participate in at least one strengths-based life review with a patient in the community or inpatient setting, transcribe the story, and integrate the story into the electronic health record.

Results: Preliminary results demonstrate high acceptability and perceived development of patient-centered competencies, such as understanding patients as more complete human beings. While this is a low cost and sustainable intervention, barriers include buy-in from medical educators, hospital administrators, and trainees.

Conclusions: To our knowledge, this is one of the first positive psychiatry-informed interventions to be implemented into the
