Keywords: moderately halophilic, *Salinicoccus carnicancri*, Staphylococcaceae

Salinicoccus carnicancri Jung et al. 2010 belongs to the genus *Salinicoccus* in the family Staphylococcaceae. Members of the *Salinicoccus* are moderately halophilic and originate from various salty environments. The halophilic features of the *Salinicoccus* suggest their possible uses in biotechnological applications, such as biodegradation and fermented food production. However, the genus *Salinicoccus* is poorly characterized at the genome level, despite its potential importance. This study presents the draft genome sequence of *S. carnicancri* strain Crm^T and its annotation. The 2,673,309 base pair genome contained 2,700 protein-coding genes and 78 RNA genes with an average G+C content of 47.93 mol%. It was notable that the strain carried 72 predicted genes associated with osmoregulation, which suggests the presence of beneficial functions that facilitate growth in high-salt environments.

Introduction

The genus *Salinicoccus* in the family Staphylococcaceae was first proposed by Ventosa et al. (1990) and is defined as moderately halophilic, aerobic, Gram-positive, non-motile, non-sporulating, and heterotrophic cocci [1]. The genus name is derived from the Latin adjective *salinus*, saline, and the Greek masculine noun *kokkos*, meaning a grain or berry, i.e., saline coccus [2]. Most species in the genus *Salinicoccus* have been found in salty environments, such as fermented foods [3-5], solar salterns [1,6], salt mines [7,8], a salt lake [9], and saline soils [10,11]. All type strains of *Salinicoccus* species were characterized as halotolerant organisms, where NaCl concentrations of 2–20% (wt/vol) were suitable for growth [12-14].

These moderately halophilic bacteria can survive in salt-rich environments and grow optimally at 5–20% (wt/vol) NaCl [15]. These bacteria can utilize compatible solutes or osmolytes, such as carbohydrates, amino acid, polyols, betaines, and ectoines, by regulating their osmotic concentrations in high-salt content environmental

conditions [16,17]. Therefore, these organisms may have biotechnological importance with possible applications in food biotechnology for the production of fermented food [18], in environmental biotechnology for the biodegradation of organic pollutants and the production of alternative energy [19].

Strain Crm^T (= DSM 23852 = JCM 15796 = KCTC 13301) is the type strain of the species *Salinicoccus carnicancri*. This strain was isolated from a traditional Korean fermented seafood, known as ‘ganjang-gejang,’ which is made from raw crabs preserved in soy sauce [20]. The species name was derived from the Latin nouns *caro carnis*, flesh, and *cancer -cri*, a crab, i.e., the flesh of a crab [2]. The strain can grow in 0–20% (wt/vol) NaCl with optimal growth at 12% (wt/vol) NaCl [20]. The present study summarizes the features of *S. carnicancri* strain Crm^T and provides an analysis of its draft genome sequence, which is the first reported genome sequence of a species in the genus *Salinicoccus*.

Classification and features

A taxonomic analysis was conducted based on the 16S rRNA gene sequence. The representative 16S rRNA gene sequence of strain *S. carnicancri* Crm^T was compared with the most recent release of the EzTaxon-e database [21]. The multiple sequence alignment program CLUSTAL W [22] was used to generate alignments with other gene sequences collected from databases. The alignments were trimmed and converted to the MEGA format before phylogenetic analysis. Phylogenetic consensus trees were constructed based on the aligned gene sequences using the neighbor-joining [23], maximum-parsimony [24], and maximum-likelihood [25] methods with 1,000 randomly selected bootstrap replicates using MEGA version 5

[26]. The phylogenetic analysis based on the 16S rRNA gene sequence showed that strain Crm^T was most closely related to *Salinicoccus halodurans* W24^T with 96.99% similarity. The phylogenetic consensus tree based on the 16S rRNA gene sequences indicated that strain Crm^T was clustered within a branch containing other species in the genus *Salinicoccus* (Figure 1).

Strain Crm^T (Table 1) was isolated from the fermented seafood ganjang-gejang during a project that investigated microbial communities in fermented foods, i.e., the Next-Generation BioGreen 21 Program (No. PJ008208) in Korea. Ganjang-gejang, with a NaCl (w/v) concentration of 24.5%, was produced by preserving scabbard crabs in soy sauce, garlic, and onions at -5°C for 4–5 days.

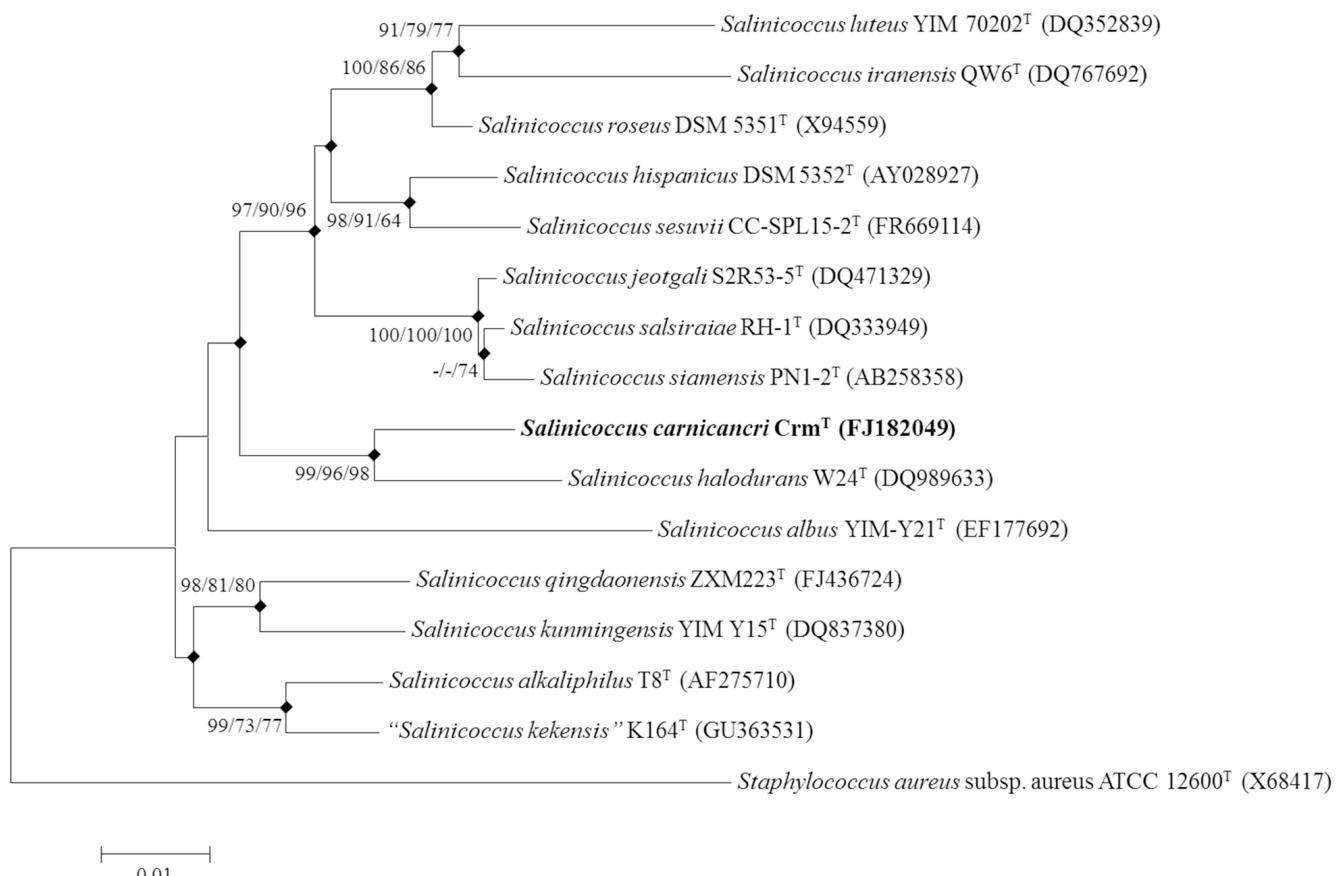

Figure 1. Phylogenetic consensus tree based on 16S rRNA gene sequences showing the relationship between *Salinicoccus carnicancri* strain Crm^T and the type strains of other species in the genus *Salinicoccus*. The type strain of *Staphylococcus aureus* was used as an outgroup. The GenBank accession numbers for the 16S rRNA genes of each strain are shown in parentheses. Filled diamonds indicate identical branches present in the phylogenetic consensus trees constructed using the neighbor-joining (NJ), maximum-parsimony (MP), and maximum-likelihood (ML) algorithms. The numbers at the nodes represent the bootstrap values as percentages of 1,000 replicates and values <70% are not shown at the branch points. The scale bar represents 0.01 nucleotide change per nucleotide position.

S. carnicancri strain Crm^T is a Gram-positive, moderately halophilic, non-motile, non-sporulating, and aerobic heterotrophic coccus with a diameter of 1.0–2.5 µm [20]. Figure 2 shows the morphological features of strain Crm^T, which were obtained by scanning electron microscopy (SEM). Colonies were ivory-colored [20]. Growth occurred at 4–45°C, with an optimum of 30–37°C, and at pH values of 6.0–11.0, with an optimum of 7.0–8.0. The salinity range suitable for growth was 0–20% (w/v) NaCl, with an optimum of 12% (w/v) NaCl [20]. Strain Crm^T contains menaquinone MK-6 as the predominant respiratory quinone [20]. The major fatty acids (>10% of total fatty acid) are anteiso-C_{15:0} (40.61%), iso-C_{15:0} (22.0%), and anteiso-C_{17:0} (12.12%) [20]. The major cellular polar lipids are phosphatidylglycerol and diphosphatidylglycerol [20]. Glycine and lysine are the major amino acid constituents of the cell-wall hydrolysate [20].

Genome sequencing and annotation

Genome project history

S. carnicancri strain Crm^T was selected for sequencing because of its environmental potential as part of the Next-Generation BioGreen 21 Program (No.PJ008208). The genome project is deposited in the Genomes OnLine Database [40] and the genome sequence is deposited in GenBank. Sequencing and annotation were performed by ChunLab Inc., South Korea. A summary of the project information is shown in Table 2.

Growth conditions and DNA isolation

S. carnicancri strain Crm^T was grown aerobically in marine 2216 (Marine medium, BBL), supplemented with 10% (w/v) NaCl at 30°C. Genomic DNA was extracted using a Wizard Genomic DNA

Purification Kit (Promega A1120), according to the manufacturer's instructions.

Genome sequencing and assembly

The genome of *S. carnicancri* Crm^T was sequenced using a combination of a 454 Genome Sequencer FLX Titanium system (Roche Diagnostics) with an 8 kb paired end library, an Illumina Hiseq system with a 150 base pair (bp) paired end library, and a PacBio RS system (Pacific Biosciences). A total of 7,434,400 sequencing reads (443.6-fold genome coverage) were obtained using the Roche 454 system (187,030 reads; 12.1-fold coverage), Illumina Hiseq system (7,219,019 reads; 408.4-fold coverage), and PacBio RS system (28,351 reads; 23.1-fold coverage) combined. The Roche 454 pyrosequencing and Illumina sequencing reads were assembled using Roche gsAssembler 2.6 (Roche Diagnostics) and CLCbio CLC Genomics Workbench 5.0 (CLCbio), respectively. Table 2 shows the project information and its associated MIGS version 2.0 compliance levels [27].

Genome annotation

The open reading frames (ORFs) of the assembled genome were predicted using a combination of the Rapid Annotation using Subsystem Technology (RAST) pipeline [41] and the GLIMMER 3.02 modeling software package [42]. Comparisons of the predicted ORFs using the SEED [43], NCBI COG [44], NCBI Refseq [45], CatFam [46], Ez-Taxon-e [21], and Pfam [47] databases were conducted during gene annotation. RNAmmer 1.2 [48] and tRNAscan-SE 1.23 [49] were used to find rRNA genes and tRNA genes, respectively. Additional gene prediction analyses and functional annotation were performed using the Integrated Microbial Genomes - Expert Review (IMG-ER) platform [50].

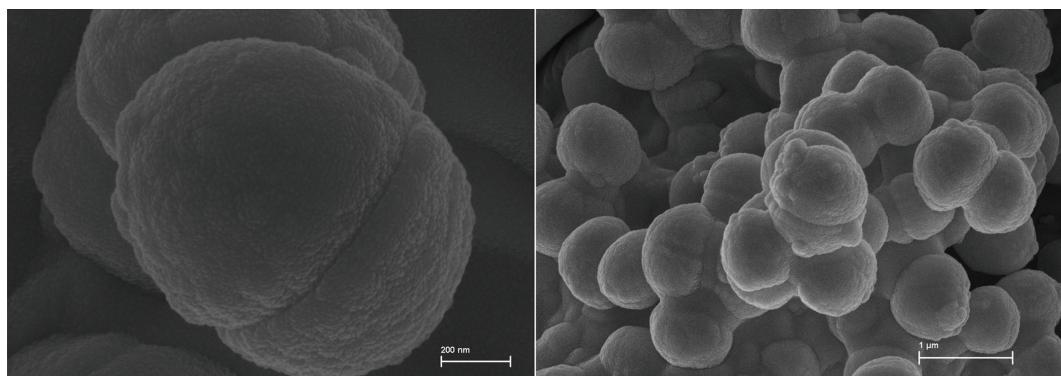

Figure 2. Scanning electron microscopy images of *S. carnicancri* Crm^T obtained using a SU-PRA VP55 (Carl Zeiss) at an operating voltage of 15kV. The scale bars represents 200 nm (left) and 1 µm (right), respectively.

Table 1. Classification and general features of *Salinicoccus carnicancri* strain Crm^T according to the MIGS recommendations [27].

Genome properties

The draft genome sequence of *S. carnicancri* Crm^T was 2,673,309 bp, which comprised three scaffolds that included 12 contigs. The G+C content was 47.93 mol% (Figure 3 and Table 3). RAST and GLIMMER predicted 2,778 coding sequences (CDSs) in the genome. Of the predicted ORFs, 2,700 ORFs were assigned to protein-coding genes. A total of 2,298 genes (82.72%) were

assigned putative functions, whereas the remaining genes were annotated as hypothetical proteins. The genome contained 78 ORFs assigned to RNA genes, including 61 predicted tRNA genes, nine rRNA genes (three 5S rRNA, three 16S rRNA, and three 23S rRNA genes), and eight other RNA genes. The distributions of genes in the COG functional categories are presented in Table 4.

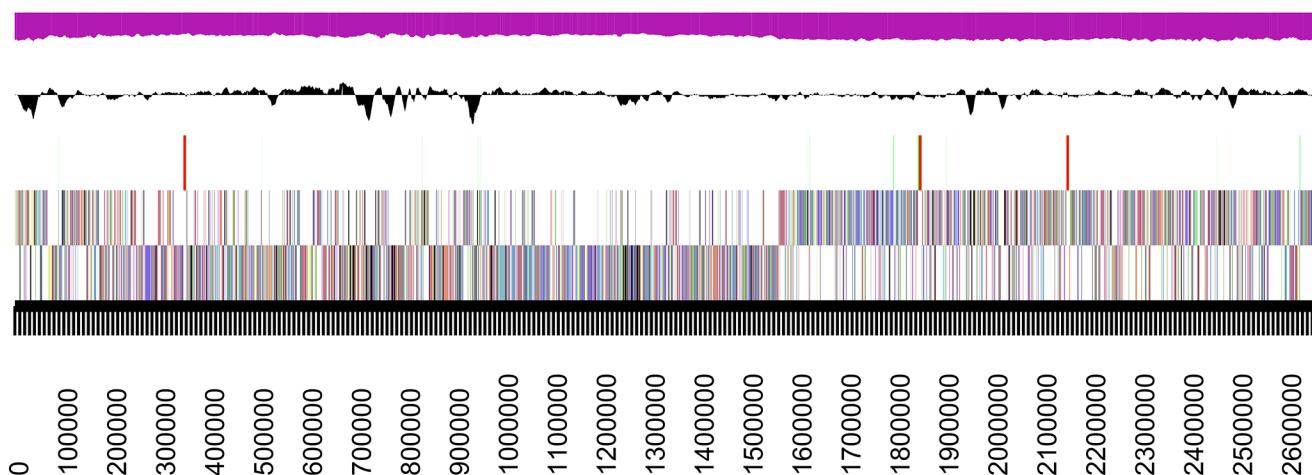

Figure 3. Graphical map of the largest scaffold, C792_Scaffold00001.1, which represented >99.6% of the chromosome. The smaller scaffolds of the chromosome are not shown. From bottom to top: genes on the forward strand (colored according to COG categories), genes on the reverse strand (colored according to COG categories), RNA genes (tRNAs = green, rRNAs = red, and other RNAs = black), GC content, and GC skew.

Table 3. Genome statistics.

Attribute	Value	% of total ^a
Genome size (bp)	2,673,309	100.00%
DNA coding region (bp)	2,420,461	90.54%
DNA G+C content (bp)	1,279,282	47.93%
Total genes	2,778	100%
RNA genes	78	2.81%

^aThe total is based on the total number of protein-coding genes in the annotated genome.

Insights from the genome sequence

S. carnicancri Crm^T encoded 72 predicted genes associated with the biosynthesis of compatible solutes and the transport of osmolytes, such as choline-glycine betaine transporter (BetT) and periplasmic glycine betaine/choline-binding lipo-protein of an ABC-type transport system (OpuBC). Potentially, these genes are key factors that allow

S. carnicancri to adapt to high-salt environments (e.g., salt-fermented food) by regulating the osmotic concentration. Further studies are required to elucidate the osmoregulation mechanism, which could facilitate biotechnological applications of this halophilic bacterium.
