Concentration factor

## ABSTRACT

This article provides the data which were analyzed in the research article “Different factors determine  $^{137}\text{Cs}$  concentration factors of freshwater fish and aquatic organisms in lake and river ecosystems” (Y. Ishii, S. S. Matsuzaki, S. Hayashi, 2019) [1]. Radionuclide accumulation in aquatic organism is defined in terms of the concentration factor (CF), which is calculated as the radionuclide concentration in the organism ( $\text{Bq kg}^{-1}$ ) divided by that in the surrounding water ( $\text{Bq L}^{-1}$ ). Quantification of the radionuclide CF allows estimation of environmental radionuclide transfer and the potential risks of consuming fish contaminated with the radionuclide. We calculated the  $^{137}\text{Cs}$  CF values for freshwater fish and aquatic organisms using the monitoring data of multiple sites in five rivers and three lakes of Fukushima in years 2013–2017 after the Fukushima Dai-ichi Nuclear Power Plant accident. The data also include the  $^{137}\text{Cs}$  activity concentration of the water and water chemistry data (pH, biochemical oxygen demand, chemical oxygen demand, dissolved oxygen, electric conductivity, salinity, total organic carbon, suspended solid concentration, turbidity) at each sampling location associated with each CF value.

## Specifications table

Subject area	Environmental Science
More specific subject area	Pollution
Type of data	Tables and Figures
How data was acquired	Coaxial germanium detectors (Canberra GC2020 [Mirion Technologies, San Ramon, CA, USA], Canberra GC4020 [Mirion Technologies], ORTEC GMX 60–83 [Ametek Ortec, Oak Ridge, TN, USA], and GEM 40–76 [Ametek Ortec]) and well-type germanium detectors (Canberra GCW2523 [Mirion Technologies] and ORTEC GWL–90–15–XLB–AWT [Ametek Ortec])
Data format	Raw and analyzed
Experimental factors	The $^{137}\text{Cs}$ activity concentrations were measured for the wet whole-body samples of freshwater fish and other aquatic organisms from five rivers and three lakes in Fukushima Prefecture after the Fukushima Daiichi Nuclear Power Plant accident.
Experimental features	The $^{137}\text{Cs}$ activity concentrations and their concentration factors, which are defined as the ratio of $^{137}\text{Cs}$ activity in the samples ( $\text{Bq kg}^{-1}$ fresh weight) to that of $^{137}\text{Cs}$ activity in the water ( $\text{Bq L}^{-1}$ ), were calculated for freshwater fish and other aquatic organisms.
Data source location	Uda river, Mano river, Niida river, Ota river, Abukuma river, Lake Hayama, Lake Akimoto, and Lake Inawashiro in Fukushima Prefecture, Japan
Data accessibility	Data presented in this article
Related research article	[If your data article is related to a research article, please cite your associated research article here]. Author's name: Yumiko Ishii, Shin-ichiro S. Matsuzaki, Seiji Hayashi Title: Different factors determine $^{137}\text{Cs}$ concentration factors of freshwater fish and aquatic organisms in lake and river ecosystems Journal: Journal of Environmental Radioactivity DOI: <a href="https://doi.org/10.1016/j.jenvrad.2019.106102">doi.org/10.1016/j.jenvrad.2019.106102</a>

**Value of the data**

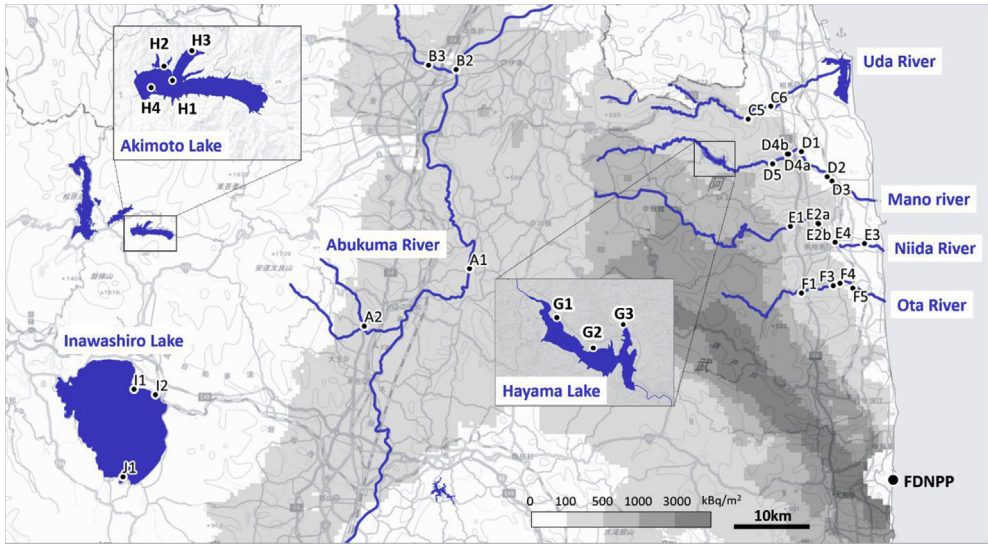

- This data can be useful for researchers for the estimation of the radiological risks associated with the freshwater ecosystem.
- The data can be useful for comparison of  $^{137}\text{Cs}$  bioaccumulation with other regions or other ecosystems.
- The data can be useful for further research of the factors affecting  $^{137}\text{Cs}$  accumulation in freshwater aquatic organisms.

**1. Data**

The dataset contains the  $^{137}\text{Cs}$  activity concentrations and their concentration factors (CF), which are defined as the ratio of  $^{137}\text{Cs}$  activity in the samples ( $\text{Bq.kg}^{-1}$  fresh weight) to that of  $^{137}\text{Cs}$  activity in the water ( $\text{Bq.L}^{-1}$ ), of freshwater fish and other aquatic organisms in Fukushima. We compiled the data from the Radioactive Material Monitoring Surveys of the Water Environment [2] sponsored by the Japanese Ministry of the Environment (MOE). Information about the sampling sites in Fukushima is presented in Fig. 1 (Map of the sampling sites), Fig. 2 (Pictures of the sampling sites) and Table 1 (List of sampling sites). The  $^{137}\text{Cs}$  CF values are summarized for freshwater fish species (Table 2) and other freshwater aquatic organisms (Table 3). The datasets which were used to calculate the  $^{137}\text{Cs}$  CF values and associated water chemistries are attached as a supplementary file to this article as Appendix A (freshwater fish species) and Appendix B (other freshwater aquatic organisms).

**2. Experimental design, materials and methods****2.1. The MOE monitoring**

The MOE monitoring data were obtained for  $^{137}\text{Cs}$  activity concentrations for freshwater fish and aquatic organisms at multiple sites in Fukushima Prefecture since 2011, after the Fukushima Daiichi Nuclear Power Plant accident. The MOE monitoring dataset presented the following advantages: low

**Fig. 1.** Map of locations of sampling sites.  $^{134}\text{Cs}$  and  $^{137}\text{Cs}$  total depositions in Fukushima are shown in gray scale, according to data from the 5th Airborne Radiation Monitoring by the Ministry of Education, Culture, Sports, Science, and Technology (MEXT) in 2012. This map used the digital topographic tile of the Geospatial Information Authority of Japan.

$^{137}\text{Cs}$  activity in water was quantified without it going below the detection limit; a large number of concentration factor (CF) values of fish and other aquatic organisms can be evaluated in a wide geographical range in Fukushima; and the water quality was measured in detail at every sampling location. Aquatic organisms included not only fish but also litter, plankton, periphyton, aquatic plants, aquatic insects, crustaceans, mollusks, and amphibians. From the calculation of the  $^{137}\text{Cs}$  concentration factors, it is evident that equilibrium between the biota and the water samples was not attained immediately after the accident. Because the data indicated the CFs were relatively stable after 2013, we calculated the CFs of  $^{137}\text{Cs}$  for the years 2013–2017.

## 2.2. Study area

The monitoring was conducted in five rivers (Uda River, Mano River, Niida River, Ota River, and Abukuma River) and three lakes (Lake Hayama, Lake Akimoto, and Lake Inawashiro) of Fukushima, Japan (Figs. 1 and 2). Table 1 shows the geographic coordinates (latitudes and longitudes) of the sampling locations. The Abukuma River in central Fukushima flows through areas with relatively low contamination levels. The Abukuma river includes the monitoring sites Abukuma A and B. Lakes Akimoto and Inawashiro are located in central Fukushima, and Lake Hayama is a dammed lake upstream of the Mano River. Fish, aquatic organisms, litter, and water samples were collected at 2–4 monitoring sites per river or lake.

## 2.3. Sample collection and preparation

The sampling was conducted four times a year (spring: May to July, summer: August to September, autumn: October to November, and winter: December) at each site. Water was sampled at each monitoring site. Each water sample was filtered through a plankton net (72–75  $\mu\text{m}$  mesh) to exclude organic and inorganic contaminants, the filtration process could not distinguish dissolved and particulate forms of  $^{137}\text{Cs}$  in water. The filtered water sample was used to measure pH, biochemical oxygen demand (BOD), chemical oxygen demand (COD), dissolved oxygen (DO), electric conductivity (EC), salinity, total organic carbon (TOC), suspended solid concentration (SS), turbidity and water

**Fig. 2.** Pictures of the sampling sites.

temperature. The level of  $^{137}\text{Cs}$  activity in the water samples was determined by the ammonium phosphomolybdate method [3].

Freshwater fish and other aquatic organisms were sampled and  $^{137}\text{Cs}$  activity concentrations measured as whole-body wet samples. All biota samples were rinsed with water, chopped, homogenized, and frozen from  $-25$  to  $-30$  °C in plastic containers (U8; diameter = 50 mm; height = 62 mm). Detailed descriptions of sample collection and preparation for germanium gamma-ray spectrometer analysis are given in Ishii et al. (2019) [1].

#### 2.4. Gamma spectrometric analysis

The  $^{137}\text{Cs}$  activity concentrations were measured using coaxial germanium detectors (Canberra GC2020 [Mirion Technologies, San Ramon, CA, USA], Canberra GC4020 [Mirion Technologies], ORTEC GMX 60–83 [Ametek Ortec, Oak Ridge, TN, USA], and GEM 40–76 [Ametek Ortec]) and well-type germanium detectors (Canberra GCW2523 [Mirion Technologies] and ORTEC GWL–90–15–XLB–AWT [Ametek Ortec]). The relative efficiency of these germanium detectors ranged from 23 to 60%. The instruments were calibrated using the standard volume radioactivity source for U8 containers (1 mm, 3 mm, 5 mm, 10 mm, 20 mm, 30 mm, and 50 mm) [Eckert & Ziegler, Berlin, Germany] and for Teflon tube containers (2 mm, 5 mm, 10 mm, 20 mm, and 40 mm) [Eckert & Ziegler]. Samples were measured considering <10% errors per net area counts. The counting time was extended up to 80,000 s. Gamma Station (Seiko EG&G Co. Ltd., Chuo-ku, Tokyo, Japan) and Gamma Explorer (Mirion Technologies) were used to analyze the  $\gamma$ -ray spectra for the 661.6382 keV of  $^{137}\text{Cs}$ .  $^{137}\text{Cs}$  activity concentration of samples was corrected for radioactive decay since the sample collection date.

#### 2.5. Calculation of $^{137}\text{Cs}$ CF for fish species

For the calculation of  $^{137}\text{Cs}$  CFs, the  $^{137}\text{Cs}$  activity levels of the freshwater fish were divided by the water  $^{137}\text{Cs}$  activity. The water  $^{137}\text{Cs}$  activity, and other water chemistry values which were measured simultaneously at the same monitoring site as fish collection were referenced from the monitoring data. When the values of BOD were described as < 0.5 in the monitoring data, they were replaced by 0.25, and when the values of SS were described as < 1, they were replaced by 0.5. If the sample was collected from multiple sampling points, the water  $^{137}\text{Cs}$  activity, and the water quality values of the

**Table 2**

$^{137}\text{Cs}$  concentration factors ( $\text{Lkg}^{-1}$ ) for freshwater fish. AM: arithmetic mean, ASD: arithmetic standard deviation, GM: geometric mean, GSD: geometric standard deviation. For *Carassius* sp., *Cottus* sp., Loach, and *Rhinogobius* sp., multiple species were merged to a group. The merged species name and the number of samples for each species are listed in the “merged species name” column.

<i>Tridentiger brevispinis</i>	Omnivore	Demersal	River	3	$1.2 \times 10^3$	$2.6 \times 10^2$	$1.2 \times 10^3$	1.2	$1.0 \times 10^3$	$1.5 \times 10^3$

**Table 3**

$^{137}\text{Cs}$  concentration factors ( $\text{Lkg}^{-1}$ ) for freshwater aquatic organisms. Samples which were identified to the species level are listed in the species name column. AM: arithmetic mean, ASD: arithmetic standard deviation, GM: geometric mean, GSD: geometric standard deviation.

Aquatic organisms	Species name	Ecosystem type	N	AM	ASD	GM	GSD	Min.	Max.
Litter		River	112	$3.2 \times 10^3$	$3.5 \times 10^3$	$1.9 \times 10^3$	3.0	$7.6 \times 10^1$	$2.4 \times 10^4$
Plankton		Lake	40	$1.7 \times 10^3$	$3.7 \times 10^3$	$4.1 \times 10^2$	5.2	$1.9 \times 10^1$	$2.0 \times 10^4$
Periphyton		River	116	$7.3 \times 10^3$	$5.4 \times 10^3$	$5.3 \times 10^3$	2.4	$2.7 \times 10^2$	$2.6 \times 10^4$
Moss	<i>Sphagnum</i> sp.(7)	River	9	$3.3 \times 10^3$	$3.0 \times 10^3$	$2.3 \times 10^3$	2.6	$4.9 \times 10^2$	$1.0 \times 10^4$
Filamentous algae	<i>Spirogyra</i> sp.(14), <i>Oedogonium</i> sp. (2), <i>Cladophora</i> sp.(1)	River	15	$8.2 \times 10^2$	$1.2 \times 10^3$	$3.2 \times 10^2$	4.3	$1.6 \times 10^1$	$4.5 \times 10^3$
Aquatic plant	<i>Elodea nuttallii</i> (7), <i>Nuphar japonicum</i> (17), <i>Nymphoides peltata</i> (8), <i>Phragmites australis</i> (6), <i>Potamogeton bertholdii</i> (4), <i>Potamogeton crispus</i> (5), <i>Potamogeton pusillus</i> (3)	Lake	2	$1.2 \times 10^3$	$1.5 \times 10^3$	$4.9 \times 10^2$	9.0	$1.0 \times 10^2$	$2.3 \times 10^3$
		River	18	$1.5 \times 10^3$	$2.7 \times 10^3$	$5.8 \times 10^2$	4.0	$9.2 \times 10^1$	$9.2 \times 10^3$
Snail	<i>Semisclospira libertina</i> (50)	Lake	32	$2.1 \times 10^2$	$2.4 \times 10^2$	$1.4 \times 10^2$	2.2	$2.6 \times 10^1$	$1.3 \times 10^3$
		River	43	$1.8 \times 10^3$	$4.1 \times 10^3$	$6.6 \times 10^2$	3.6	$2.1 \times 10^1$	$2.2 \times 10^4$
Shrimp	<i>Paratya improvisa</i> (44), <i>Palaemon paucidens</i> (24), <i>Neocaridina</i> sp.(14)	Lake	7	$1.9 \times 10^3$	$1.5 \times 10^3$	$1.4 \times 10^3$	2.5	$3.8 \times 10^2$	$4.7 \times 10^3$
		River	106	$1.2 \times 10^3$	$7.5 \times 10^2$	$9.9 \times 10^2$	2.2	$7.1 \times 10^1$	$3.2 \times 10^3$
Crayfish	<i>Procambarus clarkii</i> (53), <i>Pacifastacus leniusculus</i> (20)	River	53	$1.3 \times 10^3$	$1.1 \times 10^3$	$9.7 \times 10^2$	2.4	$9.7 \times 10^1$	$5.0 \times 10^3$
		Lake	20	$1.9 \times 10^3$	$6.9 \times 10^2$	$1.8 \times 10^3$	1.4	$9.3 \times 10^2$	$3.5 \times 10^3$
Crab	<i>Eriocheir japonica</i> (55), <i>Geothelphusa dehaani</i> (2)	River	57	$1.4 \times 10^3$	$1.1 \times 10^3$	$1.0 \times 10^3$	2.4	$6.6 \times 10^1$	$7.0 \times 10^3$
Detritivore insect	<i>Stenopsyche marmorata</i> (95), <i>Isonychia japonica</i> (9), <i>Ephemera strigata</i> (7), <i>Drunella cryptomeria</i> (2)	River	125	$2.9 \times 10^3$	$2.2 \times 10^3$	$2.2 \times 10^3$	2.2	$2.4 \times 10^2$	$1.4 \times 10^4$
Carnivore insect	<i>Protohermes grandis</i> (44), <i>Parachauliodes continentalis</i> (12), <i>Macromia amphigena amphigena</i> (19), <i>Sieboldius albardae</i> (7), <i>Anotogaster sieboldii</i> (6), <i>Kamimuria tibialis</i> (6)	River	176	$7.8 \times 10^2$	$8.1 \times 10^2$	$5.5 \times 10^2$	2.3	$6.9 \times 10^1$	$6.5 \times 10^3$
		Lake	3	$5.7 \times 10^2$	$1.1 \times 10^2$	$5.6 \times 10^3$	1.2	$4.8 \times 10^2$	$7.0 \times 10^2$
Tadpole	<i>Rana catesbeiana</i> (9), <i>Lithobates catesbeianus</i> (3)	River	49	$5.7 \times 10^3$	$4.0 \times 10^3$	$4.3 \times 10^3$	2.3	$5.0 \times 10^3$	$2.1 \times 10^4$
		Lake	3	$7.2 \times 10^3$	$4.6 \times 10^3$	$5.6 \times 10^3$	2.6	$1.8 \times 10^3$	$1.0 \times 10^4$
Adult amphibian	<i>Cynops pyrrhogaster</i> (22), <i>Rana rugosa</i> (16), <i>Rana ornativentris</i> (4), <i>Rana porosa porosa</i> (4), <i>Rana japonica</i> (3)	River	72	$1.4 \times 10^3$	$4.6 \times 10^3$	$5.5 \times 10^2$	3.0	$5.4 \times 10^1$	$3.6 \times 10^4$
		Lake	12	$8.9 \times 10^2$	$5.9 \times 10^2$	$7.2 \times 10^2$	2.0	$1.9 \times 10^2$	$2.2 \times 10^3$

sampling points were averaged. The CF values are summarized in Table 2, including 30 fish species ( $N = 1246$ ). The dataset which associated CF values with  $^{137}\text{Cs}$  activity concentration of water and water chemistries are attached as a supplementary file to this article (Appendix A). The dataset variables are as follows: site\_code: monitoring site code (see Table 1), site: monitoring site, ecosystem: the type of ecosystem (river or lake), samplingpoint: sampling point (see Table 1), date: date of sampling, season: season of sampling (spring, summer, autumn, winter), order: order of sample, family: family of sample, species: species of sample, habitat: habitat of fish (pelagic, benthopelagic, or demersal fish; based on fishbase.org information), N: number of merged fish individuals for Gamma spectrometric analysis, weight: weight of merged fish sample (kg), meansize: mean size of fish calculated by dividing the weight by N (g), remove\_IO: removal of internal organs (1: remove, 0: not removed, na: unknown), Cs137:  $^{137}\text{Cs}$  activity concentration of fish ( $\text{Bq kg}^{-1}$ ), Cs137.w:  $^{137}\text{Cs}$  activity concentration of water ( $\text{Bq kg}^{-1}$ ), CF:  $^{137}\text{Cs}$  concentration factor ( $\text{L kg}^{-1}$ ), pH: pH of water, BOD: biochemical oxygen demand of water ( $\text{mgL}^{-1}$ ), COD: chemical oxygen demand of water ( $\text{mgL}^{-1}$ ), DO: dissolved oxygen of water ( $\text{mgL}^{-1}$ ), EC: electric conductivity of water (mS/m), salinity: salinity of water (psu),

TOC: total organic carbon of water ( $\text{mgL}^{-1}$ ), SS: suspended solid concentration of water ( $\text{mgL}^{-1}$ ), turbidity: turbidity of water, and temperature: temperature of water ( $^{\circ}\text{C}$ ).

## 2.6. Calculation of $^{137}\text{Cs}$ concentration factor for other aquatic organisms

Litter, plankton, periphyton, aquatic plants, aquatic insects, crustaceans, mollusks, and amphibians were obtained from the same monitoring sites as the fish. The  $^{137}\text{Cs}$  concentration factor was calculated in the same way as for freshwater fish. The aquatic organisms, their dominant species, and their CF values are summarized in Table 3. The dataset which associated CF values with  $^{137}\text{Cs}$  activity concentration of water and water chemistries are attached as a supplementary file to this article (Appendix B). The dataset variables are as follows: site\_code: monitoring site code (see Table 1), site: monitoring site, ecosystem: the type of ecosystem (river or lake), samplingpoint: sampling point (see Table 1), date: date of sampling, season: season of sampling (spring, summer, autumn, winter), category1: category of aquatic organisms (litter, primary producer, mollusk, crustacean, aquatic insect, amphibian), category2: detailed category of aquatic organisms (litter, plankton, periphyton, aquatic plant, snail, shrimp, crab, crayfish, detritivore insect, carnivore insect, adult amphibian, tadpole), order: order of sample, species: species of sample, N: number of merged individuals for Gamma spectrometric analysis, weight: weight of merged sample, Cs137:  $^{137}\text{Cs}$  activity concentration of sample ( $\text{Bq kg}^{-1}$ ), Cs137.w:  $^{137}\text{Cs}$  activity concentration of water ( $\text{Bq kg}^{-1}$ ), CF:  $^{137}\text{Cs}$  concentration factor ( $\text{L kg}^{-1}$ ), pH: pH of water, BOD: biochemical oxygen demand of water ( $\text{mgL}^{-1}$ ), COD: chemical oxygen demand of water ( $\text{mgL}^{-1}$ ), DO: dissolved oxygen of water ( $\text{mgL}^{-1}$ ), EC: electric conductivity of water ( $\text{mS/m}$ ), salinity: salinity of water (psu), TOC: total organic carbon of water ( $\text{mgL}^{-1}$ ), SS: suspended solid concentration of water ( $\text{mgL}^{-1}$ ), turbidity: turbidity of water, and temp: temperature of water ( $^{\circ}\text{C}$ ).

## Acknowledgements

This work was financially supported by the research program on Disaster Environment, an internal budget of National Institute for Environmental Studies. The internal budget was originally issued by the Ministry of Environment, Japan (<http://www.nies.go.jp/shinsai/index-e.html>). The authors thank those who contributed to the Radioactive Material Monitoring Surveys of the Water Environment. We also thank Mr. M. Ono (KANSO CO. LTD.) for providing detailed information regarding sample processing and monitoring measurements.

## Conflict of Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

## Appendix A and B. Supplementary data

Supplementary data to this article can be found online at <https://doi.org/10.1016/j.dib.2019.105043>.
