### Circ-MALAT1 Functions as Both an mRNA Translation Brake and a microRNA Sponge to Promote Self-Renewal of Hepatocellular Cancer Stem Cells

*Liang Chen, Ruijiao Kong, Cong Wu, Shuo Wang, Zixin Liu, Shupeng Liu, Shuiping Li, Tian Chen, Chuanbin Mao,\* and Shanrong Liu\**

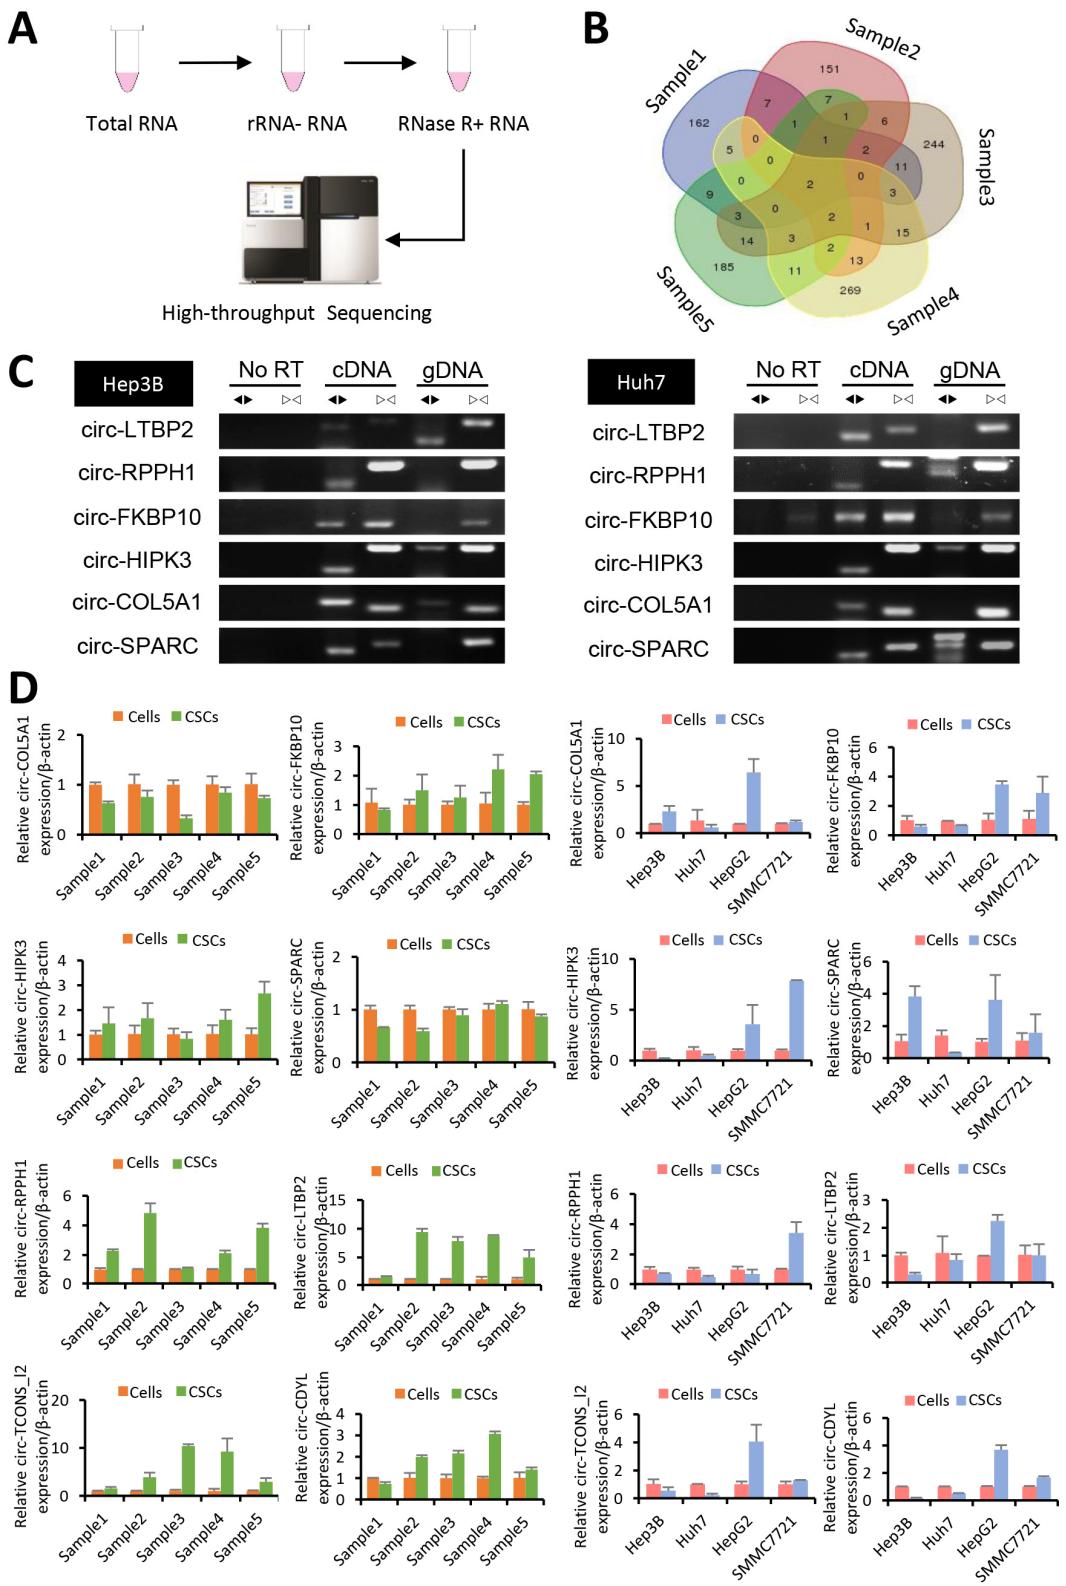

## Supplementary Materials

### Supplemental Figures

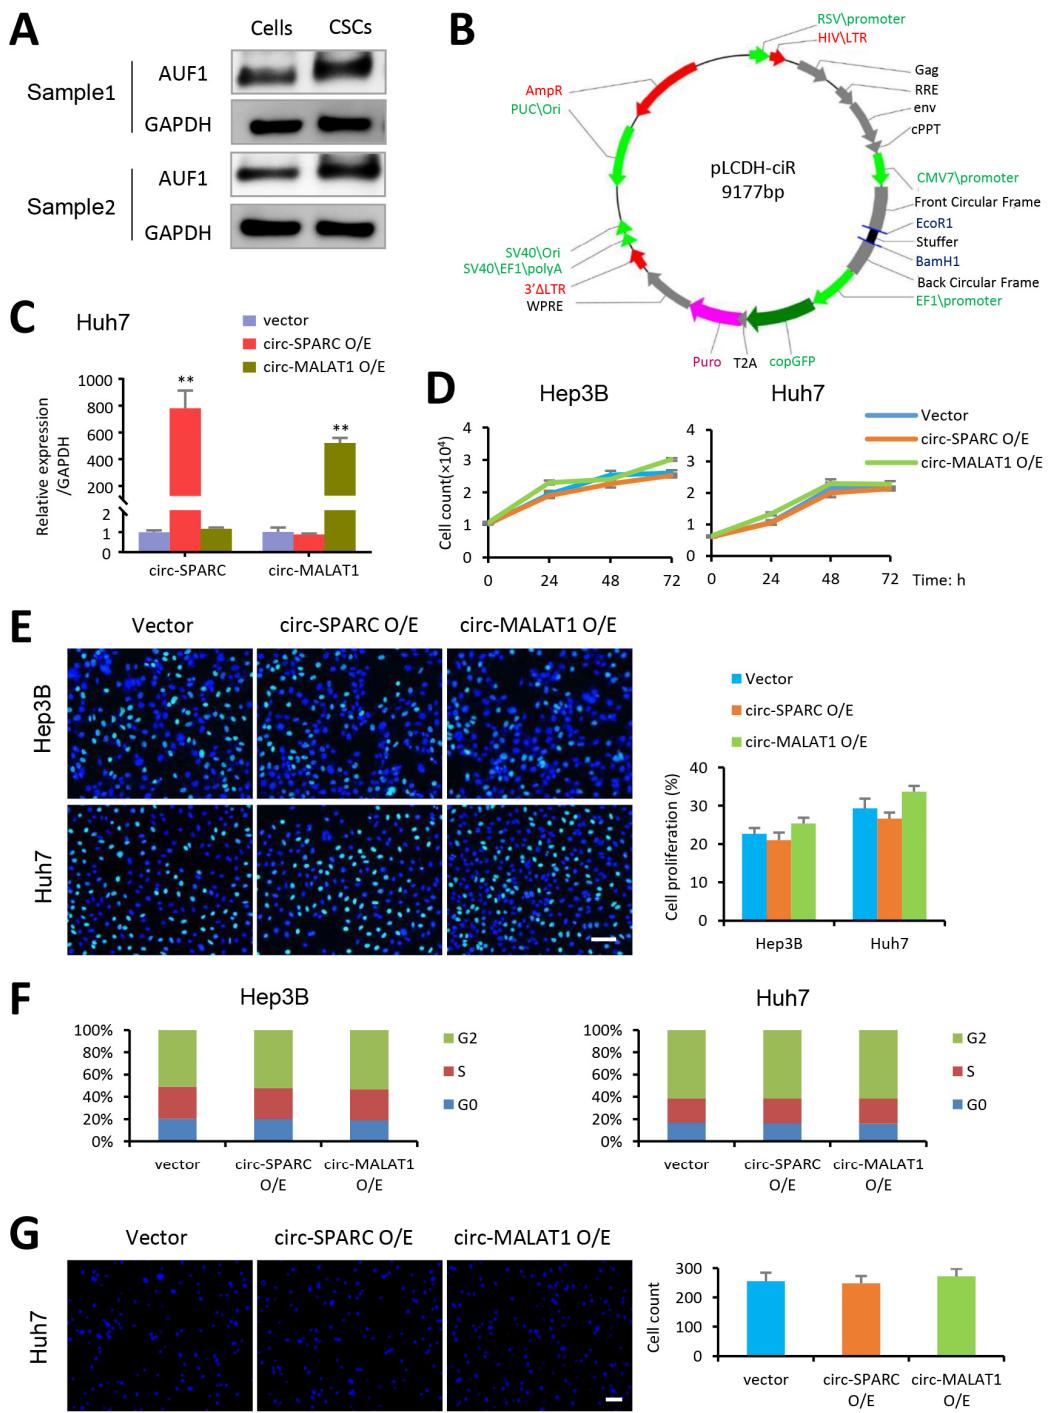

**Supplementary Figure 1 (related to Figure 1). Enrichment of CSCs by serum-free medium culture.**

(A) Pictures of tumorsphere formation were imaged by a light microscope. Scale bar, 50  $\mu$ m. (B) The mRNA levels of CSC markers, including OCT4, NANOG and SOX2 were measured by qRT-PCR. Control primers,  $\beta$ -actin. (C) The protein level of CSC marker OCT4 was measured in spheres by immunofluorescence. Scale bar, 20  $\mu$ m. Columns, mean from three independent experiments; bars, SD. \*\*  $P < 0.01$ .

**Supplementary Figure 2 (related to Figure 1). CircRNAs are expressed differentially in HCC CSCs.**

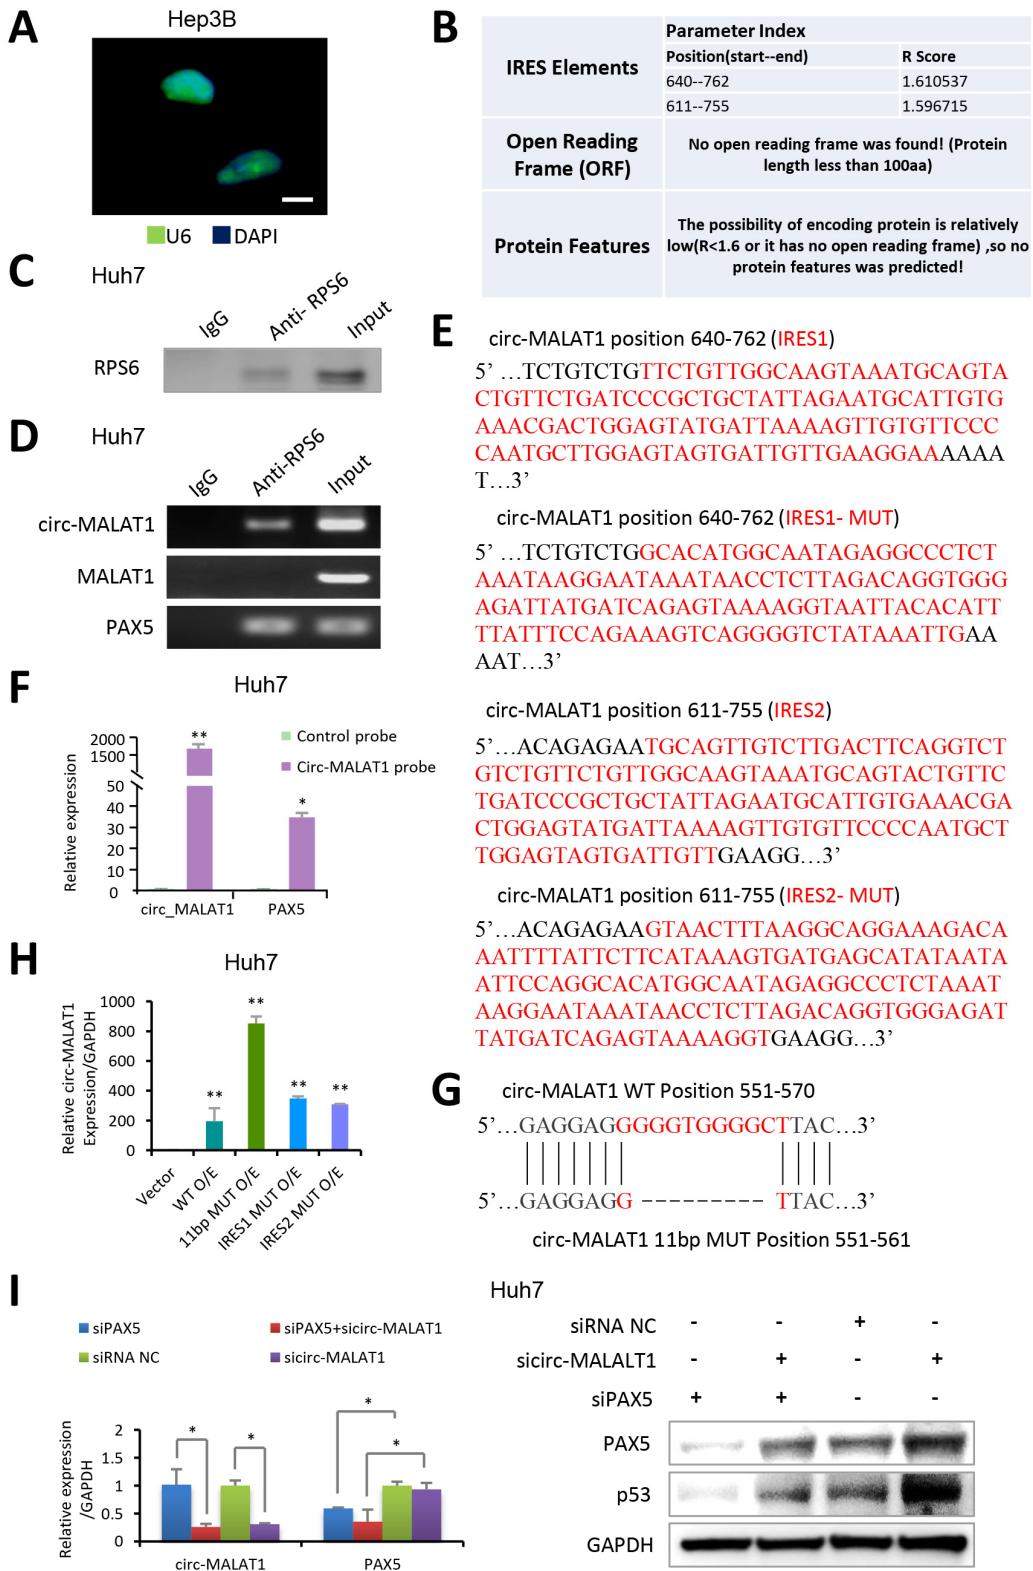

(A) Total RNA was depleted of rRNA by using RiboMinus method. rRNA-depleted samples (rRNA-) were then treated with the RNase R exonuclease (RNase R+). Sequencing libraries were prepared from each and samples were sequenced and compared. (B) Venn diagram showing that 2 circRNAs were identified in all five pairs of samples and 21 were identified in at least three of the five pairs of samples. (C) Divergent primers amplified 6 candidate circRNAs in cDNA but not genomic DNA (gDNA) and RNA (No RT). (D) Differential expression of candidate circRNAs in CSCs and matched adherent cells of HCC primary cells or HCC cell lines. Control primers,  $\beta$ -actin. CSCs were enriched by tumorsphere assay. Columns, mean from three independent experiments; bars, SD.

**Supplementary Figure 3 (related to Figure 2). Circ-MALAT1 has no significant effect on cell proliferation, cell cycle and migration of HCC cells.**

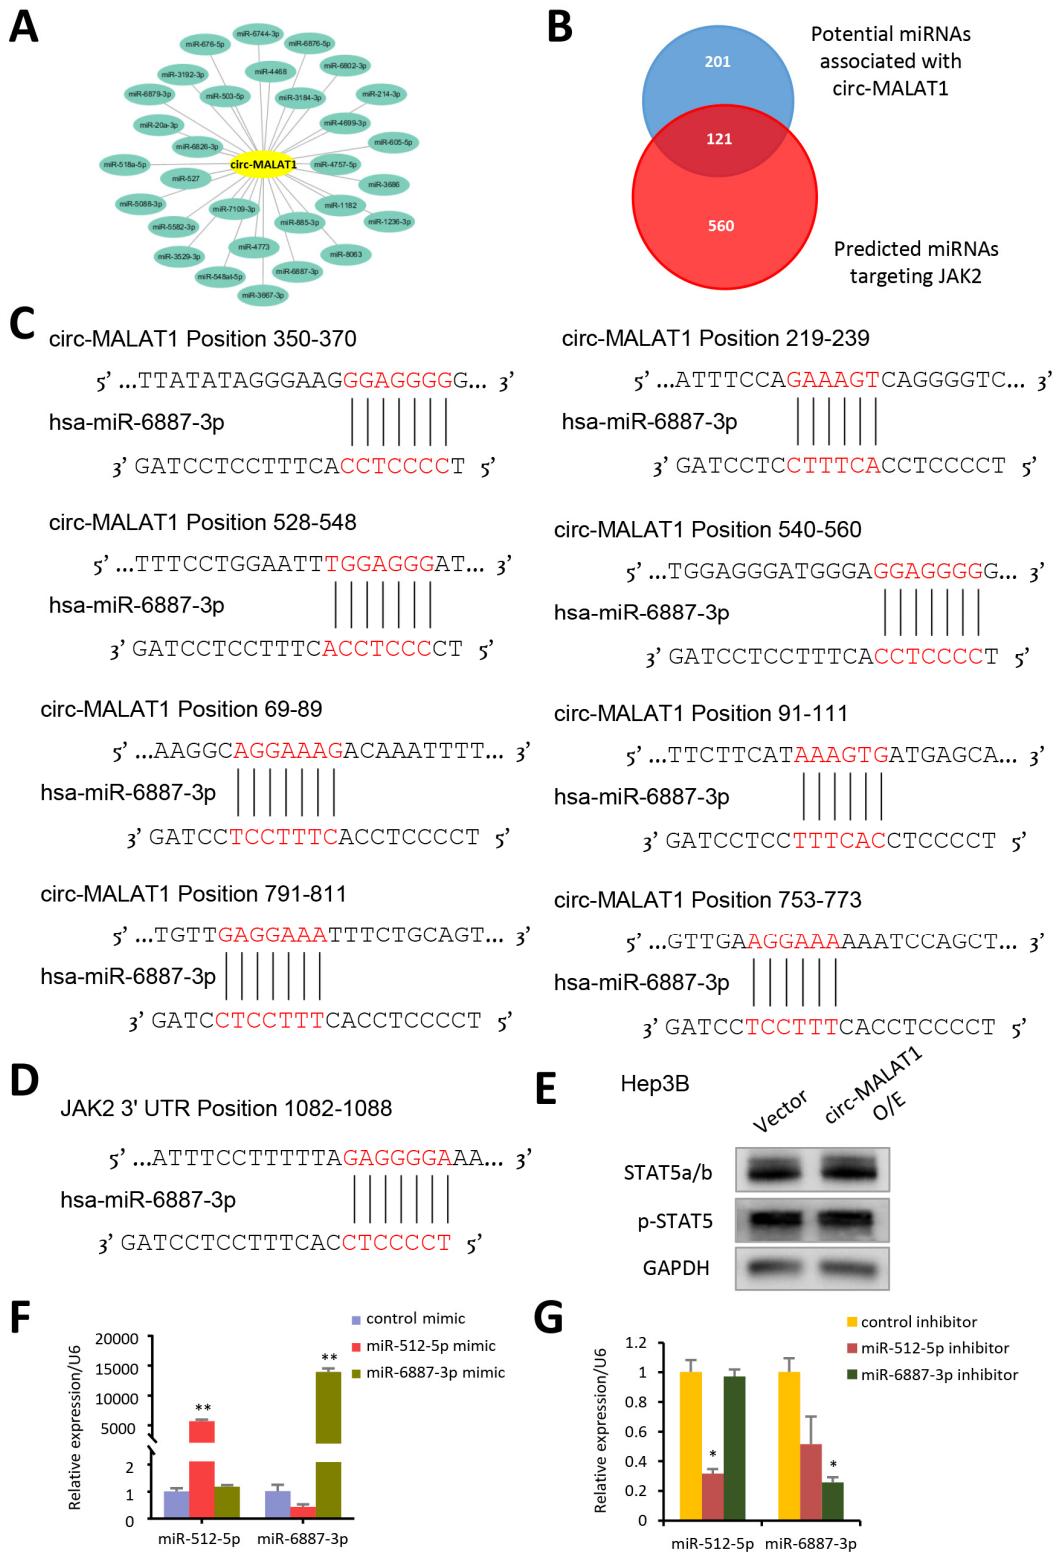

(A) AUF1 was analyzed in CSCs and matched adherent cells of HCC primary cells (Sample1 and Sample2) by western blot. CSCs were enriched by tumorsphere assay. (B) Vector map of construct used for circ-MALAT1 overexpression experiments. (C) qRT-PCR confirmed that

circ-SPARC and circ-MALAT1 were specifically overexpressed when cells were transfected with the circ-SPARC overexpression plasmid (circ-SPARC O/E) and circ-MALAT1 overexpression plasmid (circ-MALAT1 O/E) using divergent primers, respectively. Vector, empty plasmid. Control primers,  $\beta$ -actin. (D) (E) Proliferation of Hep3B and Huh7 cells transfected with circ-MALAT1 overexpression plasmid (circ-MALAT1 O/E), circ-SPARC overexpression plasmid (circ-SPARC O/E), or empty plasmid (Vector) was detected by Cell Counting Kit-8 assay and EdU imaging analysis. Scale bar, 100  $\mu$ m. (F) There was no significant difference between circ-MALAT1 overexpression (circ-MALAT1 O/E), circ-SPARC overexpression (circ-SPARC O/E), and empty vector control (Vector) on the cell cycle progression of both Hep3B and Huh7 cells. (G) Transwell assays showed no significant effect of circ-MALAT1 on cancer cell invasion. Scale bar, 100  $\mu$ m. Vector, empty plasmid; circ-SPARC O/E, circ-SPARC overexpression plasmid; circ-MALAT1 O/E, circ-MALAT1 overexpression plasmid. Similar results were obtained in three to six independent experiments. \*\*  $P < 0.01$ .

**Supplementary Figure 4 (related to Figure 4). Circ-MALAT1 obstructs PAX5 translation by binding to PAX5 coding sequence and ribosomes.**

(A) RNA fluorescence *in situ* hybridization for U6. Nuclei were stained with DAPI. Green staining signal against U6 was localized in nucleus. Scale bar, 10  $\mu$ m. (B) Analysis was performed by the circRNADb and ORFfinder databases to predict the potential IRESs and ORFs. (C) RPS6 antibody was confirmed by western blot. RPS6 protein was observed in the anti-RPS6 RIP (lane 2) and 10% Input (lane 3) but not the IgG RIP (Lane1). (D) RIP was performed using Huh7 cell lysate and either anti-RPS6 or IgG as IP antibody. PCR products of Circ-MALAT1 and PAX5 were observed in the anti-RPS6 RIP (lane RPS6) and 10% Input and substantially less was detected in the IgG RIP (Lane IgG). MALAT1 PCR product was only clearly observed in 10% input. (E) Predicted two IRES elements in circ-MALAT1 were mutated as shown. (F) *In vivo* circ-MALAT1 pull-down using circ-MALAT1 probe 2 was performed in circ-MALAT1 overexpressed Huh7 cells, followed by qRT-PCR to detect circ-MALAT1 (left panel) and PAX5 (right panel). (G) 11 bases complementary to PAX5 coding sequence in circ-MALAT1 were mutated as shown. (H) The level of circ-MALAT1 was detected in Huh7 cells overexpressing circ-MALAT1 wild (WT O/E) or mutant type (11bp MUT O/E, IRES1 MUT O/E and IRES2 MUT O/E) or not (Vector) by qRT-PCR. Control primers, GAPDH. (I) Left panel, RNA levels of circ-MALAT1 and PAX5 were analyzed by qRT-PCR. Right panel, protein levels of PAX5 and p53 were analyzed by western blot. siRNA NC, scramble control siRNA; sicirc-MALAT1, siRNA against circ-MALAT1; siPAX5, siRNA against PAX5. Control primers, GAPDH. Columns, mean from three independent experiments; bars, SD. \*\*  $P < 0.01$ , \*  $P < 0.05$ .

**Supplementary Figure 5 (related to Figure 5 and Figure 6). MiR-6887-3p has binding sites with circ-MALAT1 and potentially targets JAK2.**

(A) Radial pattern showed a part of 322 miRNA binding sites on circ-MALAT1 predicted by bioinformatics analysis. (B) 121 predicted miRNAs having binding sites with both circ-MALAT1 (blue pie) and potentially targeting JAK2 (red pie) were screened out. (C) Predicted 8 duple combinations between circ-MALAT1 and miR-6887-3p. (D) Predicted duplex combination between the JAK2 3'UTR and miR-6887-3p. (E) STAT5 and phospho-STAT5 (p-STAT5), the downstream molecules of JAK2, were analyzed in cells with circ-MALAT1 overexpressed (circ-MALAT1 O/E) or not (Vector) by western blot. (F) After treatment with miR-6887-3p mimic, miR-512-5p mimic or its scrambled version (control mimic), miRNAs of xenograft tumors were detected by qRT-PCR. miR-512-5p was used as a control miRNA. U6 was used as a control primer. (G) After treatment with miR-6887-3p inhibitor, miR-512-5p inhibitor or its scrambled version (control inhibitor), miRNAs of xenograft tumors were detected by qRT-PCR. miR-512-5p was used as a control miRNA. U6 was used as a control primer. Columns, mean from three independent experiments; bars, SD. \*\*  $P < 0.01$ , \*  $P < 0.05$ .

## Detailed Experimental Section

**Isolation of HCC Primary Cells and Cell Culture:** The tumor tissues for isolation of HCC primary cells were collected from HCC patients at the Second Affiliated Hospital of Navy Medical University (Shanghai, China). HCC primary cells were prepared from patients' tumor tissues within 2 h after surgical resection by human tumor dissociation kit (Miltenyi) according to

the recommended procedure in the manual. Cells were resuspended by Dulbecco's modification of Eagle's medium (DMEM; Corning) with 10% fetal bovine serum (FBS; Gibco) for further culture. All HCC primary cells and HCC cell lines were routinely cultured in DMEM supplemented with 10% FBS at 37°C, 5% CO<sub>2</sub>. This study was authorized by the Committee on Ethics of Biomedicine, Navy Medical University.

**Tumorsphere Assays:** Confluent routinely cultured monolayers of HCC cells were trypsinized and plated as single-cell suspensions ( $5 \times 10^4$  cells/well) onto 6-well polyHEMA (Sigma)-coated plates (Corning), and grown in DME/F-12 1:1 (Hyclone) supplemented with 20 ng/mL insulin-like growth factor (IGF; PEPROTECH), 1.0 ng/mL basic fibroblast growth factor (bFGF; PEPROTECH), and 20 ng/mL epidermal growth factor (EGF; PEPROTECH). The primary tumorspheres were counted or harvested after 5-7 d. Tumorspheres were then dissociated into single-cell suspension to be reseeded for a second round of tumorspheres formation. After 5-7 d, the secondary tumorspheres were collected and dissociated to be reseeded for a tertiary round. The tertiary tumorspheres were cultured for 5-7 d and then counted.

**CircRNA-seq Analysis:** Total RNA of over 20 µg per sample was purified using TRIzol reagent (Invitrogen). CircRNA-seq was then performed by RiboBio (Guangzhou, China). Briefly, total RNA was removed poly(A) RNA and rRNA and treated with RNase R before constructing RNA-seq libraries. Strand-specific RNA-seq libraries were then prepared and sequenced using IlluminaHiSeq 2500 platform. RNA-seq reads were sequentially aligned to the reference genome of human hg19 using TopHat<sup>[1]</sup> and TopHat-Fusion. The reads mapped with TopHat-Fusion but not with TopHat on the same chromosome were screened as candidate back-spliced junction

reads, and their precise positions were determined by further realigning against existing gene annotation. Mapping errors were adjusted with GT/AG. From the remaining reads circRNAs were identified using a computational pipeline according to the method described by Memczak et al.<sup>[2]</sup>. Reads mapped to the human hg19 genome and across an identified backsplice in each sample were counted, and counts were normalized by Reads Per Million mapped reads [RPM] and read length. CircRNAs differentially expressed between samples were selected by fold change (> 2 or < 0.5) and significance level ( $P < 0.001$ ).

**RNase R Treatment:** Total RNA was first incubated with DNase I (Invitrogen) for 15 min at 37°C to remove poly(A) RNA and rRNA and then incubated with or without 3 U/ $\mu$ g of RNase R (Epicentre) for 3 h at 37°C before they were subjected to RNA extraction.

**RNA Isolation, Reverse Transcription and qRT-PCR:** For all samples, total RNA was purified with the TRIzol Reagent (Invitrogen). First-strand cDNA was synthesized using PrimeScript™ RT Master Mix (TaKaRa) according to the manufacturer's protocol, except that reverse transcription reaction for miRNA was used miRcute Plus miRNA First-Strand cDNA Kit (TIANGEN). For circRNAs, first-strand cDNA was synthesized without Oligo dT Primer. cDNA was prepared for qRT-PCR with SYBR® Premix Ex Taq™ (TaKaRa) in a 96-well plate with specific primers (see table S6) on a LightCycler® 480 System (Roche) following the instructions. The relative expression of RNA compared with control was calculated using the  $2^{-\Delta \Delta Ct}$  method. Divergent primers were used for circRNAs-specific amplification unless otherwise indicated .

**Immunocytochemistry:** Tumorspheres were washed twice with 4% sucrose, and then fixed with

4% sucrose/4% formaldehyde (Thermo) for 15 min. Tumorspheres were washed three times for 5 min each time with 1X phosphate-buffered-saline (PBS; Corning) before dehydrating and paraffin-embedding, and cut to 6  $\mu$ m slices. Then the slices were permeabilized with 0.2% Triton X-100 (Amresco) for 10 min, and blocked with 5% normal goat serum (Abcam) for 30 min. Slices were then incubated with primary antibody for 1 h at room temperature, washed three times for 5 min each time in 1X PBS, and incubated in the secondary antibody dilution for 1 h at room temperature. Primary antibodies used included rabbit anti-Oct4 (1: 250; Abcam) and mouse anti-AFP (1: 200; Abcam). 4,6-diamidino-2-phenylindole (DAPI) was used for nucleic acid staining (Invitrogen). Secondary antibodies to IgG of rabbit or mouse were conjugated with Alexa Fluor®488 or 594, respectively (1: 250-500; Invitrogen).

**Western Blot Analysis:** Total soluble proteins extracted from the samples were separated on 10% SurePAGE™ Bis-Tris gels (GenScript) and transferred electrophoretically to an Immobilon® PVDF Membrane (Millipore). Blots were blocked in 5% bovine serum albumin, followed by incubation with antibodies specific for either proteins of interest or GAPDH. Blots were then incubated with goat anti-rabbit HRP-conjugated secondary antibodies (Santa Cruz) and visualized through enhanced chemiluminescence. Primary antibodies of GAPDH, JAK2, PAX5, FGF2, TGFB1, PTK2, GH1, ACTA1, ARFIP1, CLDN5, KRT18, STAT3, STAT5a/b, phospho-JAK2, phospho-STAT3, phospho-STAT5 and p53 were purchased from Abcam. AUF1 Rabbit mAb was purchased from Cell Signaling Technology.

**Construction of Overexpression Plasmids:** To construct circ-MALAT1 and circ-SPARC overexpression plasmid, PCR fragments were amplified from Huh7 transcripts using primers as

follows: circ-MALAT1-forward, 5'-  
 ATCTGTTCAATTACGAATTCTGAAATATGCTATCTTACAGAAACTTGTCTGCGAAC  
 -3'; circ-MALAT1-reverse: 5'- ATCATCCCAAATTA  
 GTGGATCCTCAAGAAAAAATATTCACCTAAAAATACACCAGCAA -3'; circ-SPARC  
 -forward, 5'-  
 ATCTGTTCAATTACGAATTCTGAAATATGCTATCTTACAGGTGTGCAGCAATGACA  
 ACAAG -3'; circ-SPARC-reverse: 5'-  
 ATCATCCCAAATTAGTGGATCCTCAAGAAAAAATATTCACTCTGCTTGATGCCGA  
 AGCA -3'. Fragments were inserted into the pLCDH-ciR vector (Geneseed) digested with restriction endonuclease EcoR1 and BamH1 (Thermo) using ClonExpress®II One Step Cloning Kit (Vazyme).

**Plasmid, SiRNA and MiRNA Transfection:** Circ-MALAT1 was overexpressed using custom designed plasmid as mentioned above and knocked down using custom designed siRNA oligonucleotides (RiboBio, see Table S10) with Lipofectamine 3000 (Invitrogen). AUF1 and PAX5 were knocked down using custom designed siRNA oligonucleotides (Sangon, see Table S10) with Lipofectamine 3000 (Invitrogen).  $2 \times 10^6$  cells were transfected with 5 µg plasmid or 10 nM siRNA duplex or miRNA oligonucleotides following the manufacturer's protocol. For stable overexpression of circ-MALAT1, lentivirus was produced using three-plasmid packaging system. 293T cells were co-transfected with the plasmid of interest and packaging plasmids pMD2G and psPAX2 by calcium phosphate transfection. Infectious lentiviruses were harvested at 48 h after transfection.

**Cell Proliferation, Cell Cycle and Invasion Assays:** For cell proliferation assay,  $1\times 10^4$  Hep3B or  $5\times 10^3$  Huh7 cells per well were plated into 96-well flat-bottomed plates with 100  $\mu\text{L}$  of cell suspension. Every 24 h, cell viability was measured with Cell Counting Kit-8 (Dojindo), and each experiment with six replicates was repeated three times. EdU incorporation assays were performed using the Click-iT™ EdU cell proliferation Assay Kit (Invitrogen). Before beginning, HCC cells were seeded in the appropriate amount such that they would be 60-70% confluent at the time of incubation with 2  $\mu\text{M}$  EdU. At last, the stained sections were examined using a fluorescence microscope and cell numbers in at least three random fields were counted. For cell cycle analysis, HCC cells were prepared as single cell suspensions before being fixed in 70% ethanol at 4°C overnight. The cells were labeled with propidium iodide (Sigma) and analyzed through flow cytometry (BD Biosciences). Transwell assays were carried out in Millicell chambers in triplicate.  $5-10\times 10^4$  cells were added to the upper coated filters in serum-free DMEM, and the lower chambers were supplemented with cell-free DMEM containing 10% FBS as a chemoattractant. After 12-16 h culture, cells that migrated through the filters to the bottom were fixed and stained. Cell numbers in at least three random fields were counted.

**Protein Microarrays:** Differential expressions of proteins between circ-MALAT1-overexpressed and empty vector-transfected Huh7 cells were measured using H-Wayen Biotin Label-based Human Antibody Array (#SET100), according to recommended procedures. These arrays could detect 1358 proteins. Hybridization was done at room temperature for 2 h. All slides were scanned using Axon's GenePix 4000B (Axon Instruments) scanner and analyzed using GenePix Pro 6.0. F532 Median-B532 score on each array was averaged across triplicates. Internal controls were used to normalize the results and values of vector controls were subtracted. All results were

available in Table S2.

**RNA Fluorescence *in situ* Hybridization:** Hep3B cells were fixed at 70-80% confluence in the exponential growth phase with 4% paraformaldehyde and then permeabilized in 0.5% Triton X-100. After 30 min of pre-hybridization at 37°C, the cells were hybridized with DIG-labelled probes (DIG 5'- GCAGACAAAGTTCTAAAAATACACCAGCA -3' DIG) specific to circ-MALAT1 at 37°C overnight. Signals were measured using Alexa Fluor™ 488 Tyramide Reagent (Invitrogen). Nuclei were counterstained with DAPI.

**Prediction of MiRNAs Related to CircRNAs:** The sequences and annotations of published miRNAs were obtained via miRBase database ([www.mirbase.org](http://www.mirbase.org)). The miRNAs with high confidence in humans were selected. The circRNA-miRNA interaction networks were predicted using miRanda pipeline<sup>[3]</sup>. Match score was set above 170 and minimum free energy was less than -30 to improve reliability of our prediction.

**Dual Luciferase Reporter Assay:** The 3'UTR of human Janus kinase 2 (JAK2) containing miR-6887-3p target sites was cloned using the following primers: forward, 5'- GACTAGTCACATGAGGGCTGGTGTCA -3'; reverse, 5'- GGTTTAAACTGACAACAAACGAACAAACCCC -3'. The fragment was then inserted into the pMIR-REPORT vector to generate a wild-type pMIR-JAK2-3'UTR reporter. A mutated pMIR-JAK2-3'UTR plasmid was cloned with substitution of miR-6887-3p target site. Both were verified by sequencing. HEK293T cells were co-transfected with wild type or mutant constructs, scrambled mimic (or inhibitor) or miR-6887-3p mimic (or inhibitor) and pRL-TK using

Lipofectamine 3000 (Invitrogen). The cells were collected for detecting luciferase activity at 24 h post transfection using the Dual Luciferase Reporter Assay Kit (Promega). The luciferase activity was measured using the Multiscan Spectrum (PerkinElmer). miRNA mimics and inhibitors were synthesized by Sangon Biotech. The miRNA sequences were shown in Table S10.

**RNAs *in vivo* Pull Down:** The following assay was performed referring to the protocols of circRNAs *in vivo* precipitation (circRIP) by Han et al.<sup>[4]</sup> with minor modifications. Circ-MALAT1-overexpressing Huh7 cells were prepared in advance and then transfected with the biotin-tagged specific probes or control probe (Sangon, sequences shown in Table S11) at a final concentration of 0.2 μM at ~70% confluency. Cells were incubated at 37°C and 5% CO<sub>2</sub> for 24 h. The next day, after thoroughly homogenized by washing twice with Solution A and once with Solution B, 100 μL of M-280 Streptavidin Dynabeads (Invitrogen) suspension per sample was blocked for 3 h. Then, the beads mixture was washed twice in a lysis buffer and ready to be used. During blocking, cells transfected with the probes were fixed by 1% formaldehyde for 10 min, equilibrated by glycine solution for 5 min and washed with ice-cold PBS three times. After that, cell samples were resuspended with 1 mL lysis buffer, followed by sonication (50% amplitude, 10 s constant pulse, and 10 s pause) for 10 min and centrifugation at 12000 rpm for 10 min at room temperature. The supernatant was then allowed to interact with the prepared M-280 dynabeads, followed by incubation overnight with rotating at room temperature. On day 3, the resultant dynabeads-probes-RNAs mixture was washed with wash buffer A and wash buffer B twice, and resuspended in 500 μL TRIzol (Invitrogen) and subjected to RNA purification.

**RNA-binding Protein Immunoprecipitation (RIP):** RIP experiment was performed with the

Millipore universal RIP immunoprecipitation kit (Millipore) according to the manufacturer's guidelines. Briefly, circ-MALAT1-overexpressing Huh7 cells were harvested at ~90% confluence. Cell samples was resuspended and homogenized thoroughly in complete RIP lysis buffer, incubated on ice, and centrifuged at 4°C. Before cells lysis, antibodies of interest (anti-AUF1 (CST), anti-RPS6 (Abcam)) or Rabbit IgG were added to the beads suspension and incubated with rotation for 30 min at room temperature. The beads-antibody complex was then washed and resuspended in the RIP immunoprecipitation buffer. 5% of the cell supernatant was transferred into a new tube as an input and stored at -80°C until RNA purification was started. The remaining supernatant was split equally into each beads-antibody complex in the RIP immunoprecipitation buffer and incubated with rotating at 4°C overnight. Next day, each immunoprecipitation tube was washed completely with the RIP wash buffer, resuspended in the protein K buffer and incubated with shaking for 30 min at 55°C to digest the proteins. After incubation and magnetic separation, the supernatant was transferred into a new RNase-free tube and subjected to RNA isolation.

**Tumor Xenograft Model:** Male BALB/c nude mice without specific pathogens of 4-5 weeks were purchased from the Charles River Laboratories (Beijing, China), and maintained under a specific pathogen-free condition. After about 1 week,  $2 \times 10^6$  HCC cells resuspended in DMEM were subcutaneously inoculated into the dorsal flank of a nude mouse (day 0). One month later, the mice were dislocated and the subcutaneous tumors were removed and measured. To verify the miRNA regulatory mechanism *in vivo*, miRNA mimic- or inhibitor-overexpressing lentivirus was injected intratumorally into mice bearing established tumors on day 14, once weekly for two weeks. After two weeks, the mice were sacrificed, and subcutaneous tumors were analyzed. All

experiments involving mice were conducted in accordance with the guidelines for animal welfare formulated by the laboratory animal center at Navy Medical University.

**Statistical Analysis:** Statistical analysis was performed by GraphPad Prism 7.0. All numerical data were presented as mean $\pm$ SD for multiple samples with at least three replicates. Differences between groups were evaluated by the two-tailed Student's *t*-test. *P* values less than 0.05 were considered significant, indicated by an asterisk (\*), and below 0.01 were considered extremely significant, indicated by two asterisks (\*\*).
