## Abstract

*Paenibacillus ihumii* sp. nov. strain AT5 (= CSUR 1981 = DSM 100664) is the type strain of *P. ihumii*. This bacterium was isolated from a stool sample from a morbidly obese French patient using the culturomics approach. The genome of this Gram-negative, facultative anaerobic, motile and spore-forming bacillus is 5 924 686 bp long. Genomic analysis identified 253 (5%) of 3812 genes as ORFans and at least 2599 (50.03%) of 5194 orthologous proteins not shared with the closest phylogenetic species.

## Introduction

*Paenibacillus ihumii* strain AT5 (= CSUR P1981 = DSM 100664) is the type strain of *P. ihumii* sp. nov. This isolate is part of an exploratory study of the gut flora from obese patients before and after bariatric surgery using a microbial culturomics approach, the aim of which is to exhaustively explore the microbial ecosystem of gut flora by using different culture conditions [1]. This bacterium was isolated from a stool sample collected before bariatric surgery from a 33-year-old Frenchwoman living in Marseille with morbid obesity.

The conventional parameters used in the delineation of bacterial species include 16S rRNA sequence identity and phylogeny [2], genomic (G + C content) diversity and DNA-DNA hybridization (DDH) [3,4]. However, these methods

present some shortfalls, mainly due to their cutoff values, which vary according to species or genera [5]. The advent of new technology tools such as high-throughput sequencing has enabled us to access descriptions of many bacterial species in the public nucleotide sequence library [6]. Recently we proposed including genomic data in a polyphasic approach to describe new bacterial taxa (taxonogenomics). This strategy considers phenotypic characteristics, genomic analysis and the matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF) spectrum and comparison [7,8]. These characteristics support the circumscription and description of the species *P. ihumii* as a novel bacterium. Here we provide a brief classification and set of characteristics for *P. ihumii* sp. nov. strain AT5 alongside the description of the complete genome sequencing and annotation.

## Materials and Methods

### Sample collection

A stool sample was collected from a 33-year-old obese Frenchwoman (body mass index 38.6 kg/m<sup>2</sup>; 100 kg, 1.61 m

tall) in November 2011. Written consent was obtained from the patient at the Nutrition, Metabolic Disease and Endocrinology service at Timone Hospital, Marseille, France. The study and consent procedures were approved by the local IFR 48 ethics committee under consent 09-022, 2010. The stool sample was stored at  $-80^{\circ}\text{C}$  after collection and studied using microbial culturomics as previously reported [1].

### Isolation and identification of strain

Growth of *P. ihumii* strain AT5 was performed in May 2015. The sterile stool extract was preincubated in blood culture bottles enriched with rumen fluid and sheep's blood as described elsewhere [1]. The culture was monitored for 30 days. On various days (days 1, 3, 7, 10, 15, 21 and 30), a seeding of the preincubated product was done on sheep's blood-enriched Columbia agar (bioMérieux, Marcy l'Etoile, France) and incubated for 24 hours in an aerobic atmosphere at  $37^{\circ}\text{C}$ . The colonies that emerged were cultivated under the same conditions for isolation. They were then identified by MALDI-TOF as described elsewhere [9]. In short, one isolated bacterial colony was picked up with a pipette tip from a culture agar plate and spread as a thin smear on an MTP 384 MALDI-TOF target plate (Bruker Daltonics, Leipzig, Germany). Each smear was overlaid with  $2\ \mu\text{L}$  of matrix solution (saturated solution of  $\alpha$ -cyano-4-hydroxycinnamic acid in 50% acetonitrile, 2.5% trifluoroacetic acid) and allowed to dry for 5 minutes. Measurements were performed with a Microflex spectrometer (Bruker). Spectra were recorded in the positive linear mode for the mass range from 2000 to 20 000 Da (parameter settings: ion source 1 (ISI), 20 kV; IS2, 18.5 kV; lens, 7 kV). A spectrum was obtained after 675 shots with variable laser power. The time of acquisition was between 30 seconds and 1 minute per spot. Identification was carried out as previously reported [10].

The 16S rRNA PCR, coupled with sequencing, was performed using GeneAmp PCR System 2720 thermal cyclers (Applied Biosystems, Foster City, CA, USA) and ABI Prism 3130xl Genetic Analyser capillary sequencer (Applied Biosystems) respectively [11]. Chromas Pro 1.34 software (Technelysium, Tewantin, Australia) was used to correct sequences, and BLASTn searches were performed in National Center for Biotechnology Information (NCBI; <http://blast.ncbi.nlm.nih.gov/gate1.inist.fr/Blast.cgi>). Sequences were then aligned using Clustal W, and phylogenetic inferences were obtained using the neighbour-joining method with MEGA 6 (Molecular Evolutionary Genetics Analysis version 6) software. The numbers of nodes correspond to the percentages of bootstrap values obtained by repeating the analysis 1000 times in order to generate a consensus tree.

### Growth conditions

Different growth temperatures (25, 28, 37, 45 and  $55^{\circ}\text{C}$ ) were tested on sheep's blood-enriched Columbia agar (bioMérieux). Growth of this strain was tested in an anaerobic atmosphere using the GENbag anaer system (bioMérieux), in a microaerophilic atmosphere using GENbag microaer system (bioMérieux) and in an aerobic atmosphere with or without 5%  $\text{CO}_2$ . The saltiness of this species was tested using 5% NaCl on Schaedler agar with 5% sheep's blood (bioMérieux) in an aerobic atmosphere.

### Biochemical, sporulation and motility assays

Biochemical assays were performed using API Gallery systems: API ZYM (bioMérieux), API 20NE (bioMérieux) and API50 CH (bioMérieux). Detection of catalase (bioMérieux) and oxidase (Becton Dickinson, Franklin Lakes, NJ, USA) was also conducted. A thermal shock at  $100^{\circ}\text{C}$  for half an hour was carried out in order to test sporulation. A fresh colony was observed between blades and slats using a Leica DM 1000 photonic microscope (Leica Microsystems, Wetzlar, Germany) at  $40\times$  to assess the motility of the bacteria.

### Microscopy

Transmission electron microscopy using a Tecnai G20 device (FEI Company, Limeil-Brevannes, France) at an operating voltage of 60 kV was performed to observe the *P. ihumii* strain AT5 after negative colouration. Gram staining was performed and observed using a Leica DM 2500 photonic microscope with a  $100\times$  oil-immersion objective lens.

### Antibiotic susceptibility

Antibiotic susceptibility of the strain was tested using 18 antibiotics, including amoxicillin 25  $\mu\text{g}$ , amoxicillin 20  $\mu\text{g}$ /clavulanic acid 10  $\mu\text{g}$ , cefalexin 30  $\mu\text{g}$ , ceftriaxone 30  $\mu\text{g}$ , ciprofloxacin 5  $\mu\text{g}$ , doxycycline 30 IU, erythromycin 15 IU, nitrofurantoin 300  $\mu\text{g}$ , gentamicin 500  $\mu\text{g}$ , gentamicin 15  $\mu\text{g}$ , imipenem 10  $\mu\text{g}$ , metronidazole 4  $\mu\text{g}$ , oxacillin 5  $\mu\text{g}$ , penicillin G 10 IU, rifampicin 30  $\mu\text{g}$ , trimethoprim 1.25  $\mu\text{g}$ /sulfamethoxazole 23.75  $\mu\text{g}$ , tobramycin 10  $\mu\text{g}$  and vancomycin 30  $\mu\text{g}$  (i2a, Montpellier, France). The Scan 1200 was used to interpret the results (Interscience, Saint-Nom-La-Bretèche, France).

### Genome sequencing and assembly

*P. ihumii* genomic DNA (gDNA) was sequenced on the MiSeq Technology (Illumina, San Diego, CA, USA) using the mate pair strategy. The gDNA was barcoded in order to be mixed with 11 other projects with the Nextera Mate Pair sample prep kit (Illumina). The gDNA was quantified by a Qubit assay using the high sensitivity kit (Thermo Fisher Scientific, Waltham, MA) to 145 ng/ $\mu\text{L}$ . The mate pair library was prepared with 1  $\mu\text{g}$  of gDNA using the Nextera mate pair Illumina guide. The gDNA

sample was simultaneously fragmented and tagged with a mate pair junction adapter. The pattern of the fragmentation was validated on an Agilent 2100 BioAnalyzer (Agilent Technologies, Santa Clara, CA, USA) using a DNA 7500 lab chip. DNA fragments were ranged in size from 1.5 to 11 kb, with an optimal size of 3.987 kb. No size selection was performed, and only 334 ng of tagmented fragments were circularized. The circularized DNA was mechanically sheared into small fragments with an optimal size of 1051 bp on the Covaris device S2 in T6 tubes (Covaris, Woburn, MA, USA). The library profile was visualized on a High Sensitivity BioAnalyzer LabChip (Agilent), and the final concentration library was measured at 2.90 nmol/L. The libraries were normalized at 2 nM and pooled. Following a denaturation step and dilution at 15 pM, the pool of libraries was loaded onto the reagent cartridge and then onto the instrument along with the flow cell. Automated cluster generation and a sequencing run were performed in a single  $2 \times 301$  bp run. In total, 7.3 Gb of information was obtained from a  $511 \text{ K/mm}^2$  cluster density, with a cluster passing quality control filters of 97.0% (12 079 000 passing filter paired reads). Within this run, the index representation for *P. ihumii* was determined to 10.02%. The 1 210 259 paired reads were trimmed and assembled to 12 scaffolds using the SPAdes software [12].

### Genome annotation and comparison

Open reading frames (ORFs) were predicted using Prodigal [13] with default parameters. Nevertheless, the predicted ORFs were excluded if they spanned a sequencing gap region (containing N). The predicted bacterial protein sequences were searched against the GenBank database and the Clusters of Orthologous Groups (COGs) database using BLASTP ( $E$  value  $1e-03$ , coverage 0.7 and 30% identity). If no hit was found, it searched against the NR database using BLASTP with an  $E$  value of  $1e-03$ , coverage 0.7 and 30% identity. If the sequence length was smaller than 80 amino acids, we used an  $E$  value of  $1e-05$ . The tRNAs and rRNAs were predicted using the tRNA Scan-SE and RNAmmer tools respectively [14,15]. SignalP and TMHMM were used to foresee the signal peptides and the number of transmembrane helices respectively [16,17]. Mobile genetic elements were predicted using PHAST and RAST [18,19]. ORFans were identified if their BLASTP  $E$  value was lower than  $1e-03$  for an alignment length greater than 80 amino acids. If alignment lengths were smaller than 80 amino acids, we used an  $E$  value of  $1e-05$ . Artemis and DNA Plotter were used for data management and visualization of genomic features respectively [20,21]. Genomes were automatically retrieved from the 16S rRNA tree using Xegen software (PhyloPattern) [22]. For each selected genome, complete genome sequence, proteome genome sequence and Orfeome genome sequence were retrieved from the FTP site of National Center for

Biotechnology Information (NCBI). All proteomes were analysed using proteinOrtho [23]. A similarity score was then computed for each pair of genomes. This score is the mean value of nucleotide similarity between all orthologous pairs in the two genomes studied (average genomic identity of orthologous gene sequences, AGIOS) [6]. For the genomic comparison, we used *P. ihumii* strain AT5 (CYXK000000000), *P. fonticola* strain DSM21315 (ARMT000000000), *P. peoriae* strain KCTC 3763 (CP011512), *P. stellifer* strain DSM 14472 (CP009286), *P. terrae* strain HPL-003 (CP003107) and *P. borealis* strain DSM 13188 (CP009285). An annotation of the entire proteome was performed to define the distribution of functional classes of predicted genes according to the clusters of orthologous groups of proteins (using the same method as for the genome annotation). *P. ihumii* genome was locally aligned two by two by using the BLAT algorithm [24,25] against each of the selected genomes previously cited, and DDH values were estimated from a generalized model. The DDH threshold is less than 70%

## Results

### Phenotypic and biochemical characterization

The *P. ihumii* strain AT5 is a Gram-negative motile rod which is catalase and oxidase negative (Fig. 1). The growth of the strain

occurred between 28 to 55°C, but optimal growth was observed at 37°C after 24 hours of incubation in an aerobic atmosphere. The colonies were approximately 1 to 2 mm in diameter and grey on 5% sheep's blood-enriched Columbia agar. Cells had a diameter ranging from 0.50 to 1.75 µm, with a mean diameter of 1 µm measured using electron microscopy (Fig. 2). No growth of this bacterium was observed using 5% NaCl on Schaedler agar with 5% sheep's blood. This bacterium is a facultative anaerobe bacillus but can also grow in a microaerophilic atmosphere. The strain was able to form spores. Table 1 summarizes the classification and main features of *P. ihumii*.

Of all the 18 antibiotics tested, the *P. ihumii* strain AT5 was susceptible to all of them except metronidazole and tobramycin. Using an API ZYM strip, we observed that *P. ihumii* possesses alkaline phosphatase, esterase (C4), esterase lipase (C8), naphthol-AS-BI-phosphohydrolase, α-galactosidase (melibiose), β-galactosidase (hydrolyase), α-glucosidase (maltase) and β-glucosidase (cellulose) activities. However, there are no activities of lipase (C14), leucine arylamidase, valine arylamidase, cystine arylamidase, trypsin, α-chymotrypsin, phosphatase acid, β-glucuronidase, N-acetyl-β-glucosaminidase, α-mannosidase and α-fucosidase. Using an API 20 NE strip, positive reactions were obtained for nitrate reduction, β-galactosidase, arabinose, β-glucosidase, mannose, mannitol, N-acetyl-glucosamine and maltose. Negative reactions were obtained for L-tryptophan, D-glucose, L-arginine, urea, gelatine, potassium gluconate, capric acid, adipic acid, malic acid, trisodium citrate and phenyl acetic acid. Using an

API 50 CH strip, we demonstrated that *P. ihumii* is able to ferment L-arabinose, D-ribose, D-xylose, methyl- $\beta$ -D-xylopranoside, D-galactose, D-glucose, D-fructose, D-mannose, D-mannitol, methyl- $\alpha$ -D-glucopyranoside, N-acetylglucosamine, amygdalin, arbutin, esculin ferric citrate, salicin, D-cellobiose, D-maltose, D-lactose, D-melibiose, D-saccharose, D-trehalose, D-raffinose, starch, glycogen, gentiobiose and D-lyxose. No fermentation were recorded for glycerol, erythritol, D-arabinose, L-xylose, D-adonitol, L-sorbose, L-rhamnose, dulcitol, inositol, D-sorbitol, methyl- $\alpha$ -D-mannopyranoside, inulin, D-melezitose, xylitol, D-turanose, D-tagatose, D-fucose, L-fucose, D-arabitol, L-arabitol, potassium gluconate, potassium 2-ketogluconate and potassium 5-ketogluconate. Table 2 presents a comparison of the different characteristics with other representatives of the *Paenibacillus* genus.

### Phylogenetic analysis

No match could be found from the spectrum generated from clean *P. ihumii* strain AT5 spots and those in the Bruker database (Fig. 3). The phylogenetic analysis, performed using 16S rRNA sequences, showed that *P. ihumii* sp. nov. strain AT5 exhibited 98.2% identity with *Paenibacillus lentus* [29], classified in the *Paenibacillaceae* family created by Ash in 1993 [30]. However, this percentage remains lower than the 98.7% 16S rRNA gene sequence threshold recommended by Stackebrandt and Ebers [2] to delineate a new species. This enables us to say that the *P. ihumii* strain AT5 is a new species within the *Paenibacillaceae* family (Table 1). A neighbour-joining phylogenetic tree (Fig. 4) based on 16S rRNA gene sequences shows the relationships between *P. ihumii* and some related taxa. The

**FIG. 4.** Phylogenetic tree highlighting position of *Paenibacillus ihumii* strain AT5 relative to other close species. Sequences are recovered using nucleotide blast against 16S rRNA Database of Silva 'All-Species Living Tree' project (LTPs119). Sequences were aligned using muscle and phylogenetic inferences obtained using approximately maximum likelihood method within Fast Tree software. Numbers at nodes are support local values computed using Shimodaira-Hasegawa test. Corresponding GenBank accession numbers for 16S rRNA genes are indicated at right of strains in tree.

*P. ihumii* 16S rRNA sequence was deposited in European Molecular Biology Laboratory–European Bioinformatics Institute (EMBL–EBI) under accession number LN881615. A gel view was performed in order to observe spectra differences between *P. ihumii* and other close bacteria (Fig. 5).

**FIG. 3.** MALDI-TOF reference mass spectrum from *Paenibacillus ihumii* strain AT5. MALDI-TOF, matrix-assisted laser desorption/ionization time-of-flight mass spectrometry.

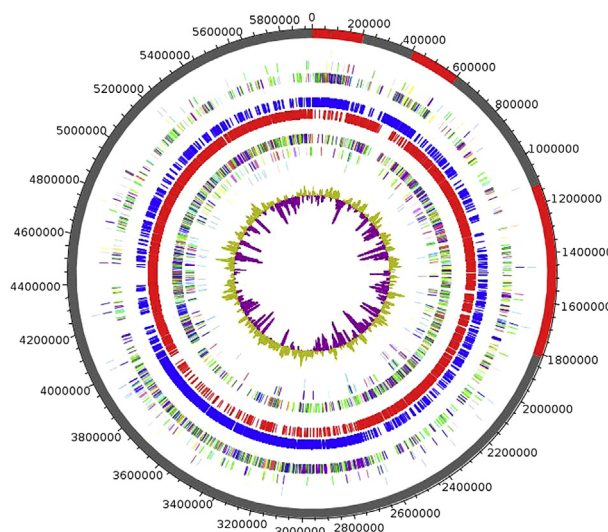

**FIG. 5.** Gel view comparing *Paenibacillus ihumii* strain AT5 to other species. Gel view displays raw spectra of loaded spectrum files arranged in pseudo-gel-like look. x-axis records *m/z* value. Left y-axis displays running spectrum number originating from subsequent spectra loading. Peak intensity is expressed by greyscale scheme code. The right y-axis indicates the peak intensity according to the colour of this peak, in arbitrary units. Displayed species are indicated on left.

**Genome properties**

The genome of *P. ihumii* strain AT5 (Fig. 6) is 5 924 686 bp long with 50.20% G + C content (Table 3). It consists of 12 scaffolds (composed of 16 contigs). Of the 5274 predicted genes, 5194 were protein-coding genes and 80 were RNAs (six 5S rRNA, five 16S rRNA, two 23S rRNA, 67 tRNA). A total of 3812 genes (73.39%) were assigned as having a putative function (by cogs or by NR blast), and 253 genes (4.87%) were identified as ORFans. The remaining genes (896 genes, 17.25%) were annotated as hypothetical proteins. Using ARG-ANNOT [31], no resistance genes were found. Nevertheless, 15 genes associated to polyketide synthase or nonribosomal peptide synthetase [32] were discovered through genome analysis and implicated in the production of secondary metabolites. The distribution of genes into COGs functional categories is presented in Table 4.

**Genome comparison**

*P. borealis*, *P. fonticola*, *P. peoriae*, *P. stellifer* and *P. terrae* are species closely related to *P. ihumii* with available genomes (Table I) and were consequently chosen for this comparative analysis. The G + C content of *P. ihumii* is smaller than that of

**FIG. 6.** Circular graphical map of genome. COGs, Clusters of Orthologous Groups database.

*P. borealis* and *P. stellifer* (50.20, 51.39 and 53.54% respectively) but larger than that of *P. fonticola*, *P. peoriae* and *P. terrae* (47.68, 46.44 and 46.77% respectively). The gene content of *P. ihumii* is smaller than that of *P. fonticola*, *P. borealis* and *P. terrae* (5194, 5645, 6213 and 5525 respectively) but larger than that of *P. peoriae* and *P. stellifer* (5122 and 4464 respectively). Fig. 7 shows that the distribution of genes into COGs categories was similar across all compared genomes. In addition, *P. ihumii* shared 2595, 2141, 1998, 2217 and 2414 orthologous genes with *P. fonticola*, *P. peoriae*, *P. stellifer*, *P. terrae* and *P. borealis* respectively (Table 5). The AGIOS values ranged from 57.59 to 87.31% among compared *Paenibacillus* species with the exception of *P. ihumii*. When *P. ihumii* was compared to other *Paenibacillus* species, the AGIOS value ranged from 57.88% for *P. fonticola* to 67.99% for *P. peoriae* (Table 5). DDH was  $28\% \pm 2.43$  for *P. fonticola*,  $17.5\% \pm 2.23$  for *P. peoriae*,  $18.2\% \pm 2.26$  for *P. stellifer*,  $17.6\% \pm 2.23$  for *P. terrae* and  $17.6\% \pm 2.24$  for *P. borealis* (Table 6). These data confirm *P. ihumii* as a unique species.

### Conclusion

On the basis of phenotypic, genomic and phylogenetic analyses, we formally propose the creation of *P. ihumii* sp. nov., which contains the strain AT5. This bacterium was isolated from a stool sample of a 33-year-old morbidly obese Frenchwoman living in Marseille.

### Taxonomic and Nomenclatural Proposals

#### Description of *P. ihumii* strain AT5 sp. nov.

*Paenibacillus ihumii* (i.hum.i'i. N.L. gen. n. *ihumii*, based on the acronym IHUMI, the Institut Hospitalo-Universitaire Méditerranée-Infection in Marseille, France, where the type strain was isolated).

Cells are Gram-negative, spore-forming, motile, rod-shaped bacilli with a size of 0.5–1.75 µm. Colonies are grey, with a diameter of 1–2 mm on 5% sheep's blood-enriched Columbia agar. The strain is catalase and oxidase negative. It has an optimum growth temperature of 37°C and is a facultative anaerobe, able to grow in a microaerophilic atmosphere.

Using API Gallery systems, positive reactions were observed for alkaline phosphatase, esterase (C4), esterase lipase (C8), naphthol-AS-BI-phosphohydrolase, α-galactosidase, β-galactosidase, α-glucosidase, β-glucosidase, nitrate reduction, β-galactosidase, mannose, mannitol, N-acetylglucosamine, arabinose, maltose, L-arabinose, D-ribose, D-xylose, methyl-βD-xylopranoside, D-galactose, D-glucose, D-fructose, D-mannose, D-mannitol, methyl-αD-glucopyranoside, N-acetylglucosamine, amygdalin, arbutin, esculin ferric citrate, salicin, D-cellobiose, D-maltose, D-lactose, D-melibiose, D-saccharose, D-trehalose, D-raffinose, starch, glycogen, gentiobiose and D-lyxose.

Cells are susceptible to amoxicillin, amoxicillin/clavulanic acid, cefalexin, ceftriaxone, ciprofloxacin, doxycycline, erythromycin, nitrofurantoin, gentamicin, imipenem, oxacillin, penicillin G, rifampicin, trimethoprim/sulfamethoxazole and vancomycin, and are resistant to metronidazole and tobramycin.

The length of the genome is 5 924 686 bp with 50% G + C content. The 16S rRNA gene sequence and whole-genome shotgun sequence of the *P. ihumii* strain AT5 were deposited

**TABLE 4. Number of genes associated with 26 general COGs functional categories**

Code	Value	% of total	Description
J	271	5.21	Translation
A	0	0	RNA processing and modification
K	462	8.89	Transcription
L	133	2.56	Replication, recombination and repair
B	1	0.01	Chromatin structure and dynamics
D	64	1.23	Cell cycle control, mitosis and meiosis
Y	0	0	Nuclear structure
V	165	3.17	Defence mechanisms
T	281	5.41	Signal transduction mechanisms
M	214	4.12	Cell wall/membrane biogenesis
N	81	1.55	Cell motility
Z	9	0.17	Cytoskeleton
W	21	0.40	Extracellular structures
U	49	0.94	Intracellular and trafficking secretion
O	159	3.06	Post-translational modification, protein turnover, chaperones
C	150	2.88	Energy production and conversion
G	623	11.99	Carbohydrate transport and metabolism
E	269	5.17	Amino acid transport and metabolism
F	110	2.11	Nucleotide transport and metabolism
H	211	4.06	Coenzyme transport and metabolism
I	125	2.40	Lipid transport and metabolism
P	212	4.08	Inorganic ion transport and metabolism
Q	95	1.82	Secondary metabolites biosynthesis, transport and catabolism
R	399	7.68	General function prediction only
S	233	4.48	Function unknown
—	1313	25.27	Not in COGs

COGs, Clusters of Orthologous Groups database.

**FIG. 7.** Distribution of functional classes of predicted genes according to clusters of orthologous groups of proteins.

**TABLE 5.** Numbers of orthologous proteins shared between genomes (upper right), average percentage similarity of nucleotides corresponding to orthologous protein shared between genomes (lower left) and numbers of proteins per genome (bold)

	<i>Paenibacillus ihumii</i>	<i>Paenibacillus fonticola</i>	<i>Paenibacillus peoriae</i>	<i>Paenibacillus stellifer</i>	<i>Paenibacillus terrae</i>	<i>Paenibacillus borealis</i>
<i>P. ihumii</i>	<b>5194</b>	2595	2141	2328	2217	2414
<i>P. fonticola</i>	57.88	<b>5645</b>	2249	2067	2328	2517
<i>P. peoriae</i>	67.99	67.76	<b>5122</b>	2084	2792	2448
<i>P. stellifer</i>	58.11	57.59	57.65	<b>4464</b>	2141	2345
<i>P. terrae</i>	67.96	67.73	87.31	57.69	<b>5525</b>	2549
<i>P. borealis</i>	58.25	57.88	58.20	72.26	58.19	<b>6213</b>

**TABLE 6.** Pairwise comparison of *Paenibacillus ihumii* with other species using GGDC, formula 2 (DDH estimates based on identities/HSP length)<sup>a</sup>

	<i>Paenibacillus ihumii</i>	<i>Paenibacillus fonticola</i>	<i>Paenibacillus peoriae</i>	<i>Paenibacillus stellifer</i>	<i>Paenibacillus terrae</i>	<i>Paenibacillus borealis</i>
<i>P. ihumii</i>	100%	28% ± 2.43	17.5% ± 2.23	18.2% ± 2.26	17.6% ± 2.23	17.6% ± 2.24
<i>P. fonticola</i>		100%	16.8% ± 2.21	17.1% ± 2.22	17.2% ± 2.22	17% ± 2.22
<i>P. peoriae</i>			100%	18.2% ± 2.26	33.7% ± 2.47	18.1% ± 2.75
<i>P. stellifer</i>				100%	18.3% ± 2.26	19.7% ± 2.3
<i>P. terrae</i>					100%	18.1% ± 2.25
<i>P. borealis</i>						100%

<sup>a</sup>Confidence intervals indicate inherent uncertainty in estimating DDH values from intergenomic distances based on models derived from empirical test data sets (which are always limited in size). These results are in accordance with the 16S rRNA and phylogenomic analyses as well as the GGDC results. DDH, DNA-DNA hybridization; GGDC, Genome-to-Genome Distance Calculator; HSP, high-scoring segment pairs.

in EMBL-EBI under accession numbers LN881615 and CYXK00000000 respectively.

The AT5 type strain (= CSUR P1981 = DSM 100664) was isolated from a stool sample from an obese Frenchwoman. The habitat of this microorganism is the human digestive tract.

### Acknowledgements

The authors thank the Xegen Company (<http://www.xegen.fr/>) for automating the genomic annotation process. This study was

funded by the Fondation Méditerranée Infection. We thank C. Andrieu for administrative assistance.

## Conflict of Interest

None declared.
