Received 17 November 2008; accepted 21 November 2008

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.036; wR factor = 0.103; data-to-parameter ratio = 23.9.

In the racemic (*S,S/R,R*) title compound, $\text{C}_{19}\text{H}_{21}\text{BrO}_4$, the two benzene rings are almost coplanar to each other, forming a dihedral angle of $3.58(10)^\circ$. The crystal packing is strengthened by intermolecular Br–O [2.9800 (16) Å] short contacts, which link the molecules into infinite one-dimensional chains along [001].

rac-2-Bromo-3-ethoxy-1,3-bis(4-methoxyphenyl)propan-1-one

H.-K. Fun, S. R. Jebas, J. N. Rao and B. Kalluraya

Comment

Chalcones, one of the major classes of natural products with widespread distribution in fruits, vegetables, spices, tea and soy based foodstuff, have recently been the subject of great interest for their interesting pharmacological activities (Di Carlo *et al.*, 1999). Chalcones and its derivatives have been reported to possess many useful properties including anti-inflammatory, antimicrobial, antifungal, antioxidant, cytotoxic, antitumor and anticancer activities (Dimmock *et al.*, 1999; Go *et al.*, 2005). Monobromo chalcones are used in the formation of many heterocyclic compounds having multiple applications (Kalluraya *et al.*, 1994; Rai *et al.*, 2007). Due to these varied applications, we have synthesized a new α -bromo chalcone and report its crystal structure.

Bond lengths and angles in (I) (Fig. 1) are found to have normal values (Allen *et al.*, 1987). There are two chiral centres C7 and C8 in the molecular structure therefore the centrosymmetric crystal is a racemate. The dihedral angle formed by the phenyl (C1—C6; C10—C15) rings is 3.58 (10) $^{\circ}$, indicating that they are almost coplanar to each other.

The crystal packing is strengthened by intermolecular Br \cdots Oⁱ=2.9800 (16) \AA [symmetry code: $X,1/2-Y,-1/2+Z$] short contact. In the crystal packing, the molecules are linked into infinite one-dimensional chains along the [001] direction (Fig 2).

Experimental

1,3-Di(*p*-anisyl)-2,3-dibromopropane (0.01 mol) when treated with ethanol(25 mL) at room temperature in presence of triethyl amine (0.02 mol) resulted in the formation of the title compound involving a nucleophilic substitution reaction.

Refinement

H atoms were positioned geometrically (C—H=0.93–0.98 \AA) and refined using a riding model with, $U_{\text{iso}}(\text{H})=1.2U_{\text{equ}}(\text{C})$ and $1.5U_{\text{equ}}(\text{Cmethyl})$. A rotating group model was used for the methyl groups.

Figures

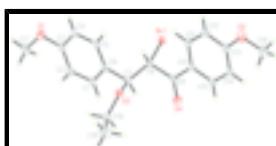

Fig. 1. The molecular structure of the title compound, showing 50% probability displacement ellipsoids and the atom numbering scheme.

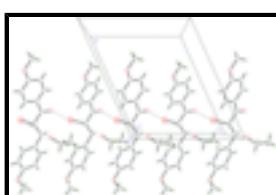

Fig. 2. The crystal packing of the title compound, viewed down the b axis, showing the linking of the molecules by Br \cdots O short contacts into an infinite one-dimensional chain along the [0 0 1]-direction.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.036$	H-atom parameters constrained
$wR(F^2) = 0.103$	$w = 1/[\sigma^2(F_o^2) + (0.0572P)^2 + 0.6245P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.09$	$(\Delta/\sigma)_{\max} = 0.001$
5229 reflections	$\Delta\rho_{\max} = 1.15 \text{ e \AA}^{-3}$
219 parameters	$\Delta\rho_{\min} = -1.21 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Experimental. The data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
