In the asymmetric unit of the title complex, $[\text{Ni}(\text{C}_{16}\text{H}_{14}\text{N}_3\text{OS})_2]$, the nickel ion is tetracoordinated in a distorted square-planar geometry by two independent molecules of the ligand which act as mononegative bidentate N,S -donors and form two five-membered chelate rings. The ligands are in *trans* (*E*) conformations with respect to the C≡N bonds. The close approach of hydrogen atoms to the Ni^{2+} atom suggests anagostic interactions ($\text{Ni}\cdots\text{H}\cdots\text{C}$) are present. The crystal structure is built up by a network of two C—H···O interactions. One of the interactions forms inversion dimers and the other links the molecules into infinite chains parallel to [100]. In addition, a weak C—H··· π interaction is also present.

1. Chemical context

Thiosemicarbazones containing N and S donor atoms have been widely used in metal coordination chemistry due to their structural flexibility and versatility (Pelosi *et al.*, 2010; Yousef *et al.*, 2013; Jagadeesh *et al.*, 2015). The chemistry of transition metal complexes of thiosemicarbazones has gained significant attention due to their potential medicinal applications (Pelosi *et al.*, 2010; Li *et al.*, 2012; Manikandan *et al.*, 2014). The variable mode of binding of thiosemicarbazone towards nickel has encouraged us to explore its coordination chemistry further since nickel has the ability to take up different coordination environments. Nickel complexes are known to catalyse carbon–carbon cross-coupling and other reactions (Suganthy *et al.*, 2013; Wang *et al.*, 2014).

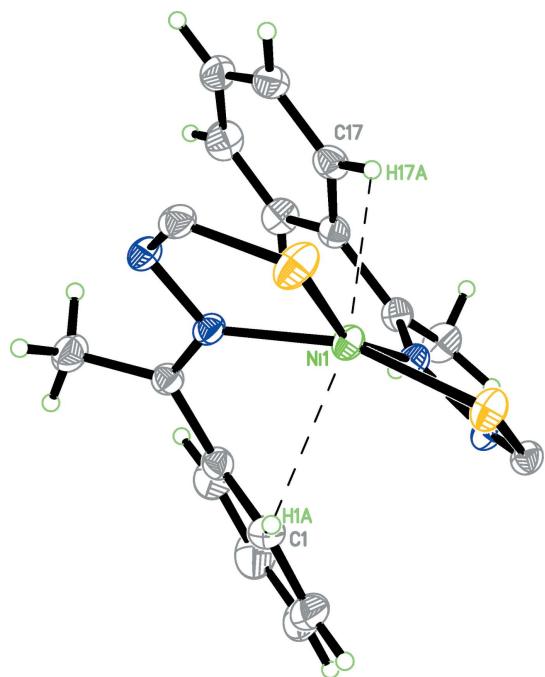

**Figure 1**

The molecular structure of (I) showing 50% probability displacement ellipsoids. H atoms are shown as spheres of arbitrary radius.

2. Structural commentary

The molecular structure of the title complex (I) with the numbering scheme is shown in Fig. 1. The nickel ion is tetra-coordinated in a square-planar geometry by two crystallographically independent molecules of the ligand which act as mononegative bidentate *N,S*-donors and form two five-membered chelate rings. The ligands are in *trans* (*E*) conformations with respect to the C7=N1 and C23=N4 bonds, as evidenced by the torsion angles N2—N1—C7—C6 = −171.0 (2) and N5—N4—C23—C22 = −171.8 (2)°, respectively. This is in close agreement with previously reported data (Sampath *et al.*, 2013; Suganthy *et al.*, 2013). A remarkable tetrahedrally distorted square-planar coordination geometry is shown by the nickel metal ion, with the two ligands displaying a less common *cis* *N,S*-chelation mode (de Oliveira *et al.*, 2014). The Ni—S and Ni—N bond lengths (Table 1) and

the N1—Ni1—S2 and N4—Ni1—S1 bond angle of 159.86 (7) and 159.67 (7)°, respectively, confirm the distortion from a typical coordination geometry.

**Figure 3**

Inversion dimers found in complex (I), formed by C—H···O hydrogen bonds (dashed lines; see Table 2).

**Figure 4**

A view along the *c* axis of the crystal packing of complex (I), showing the infinite chain [100] formed by C—H···O interaction (dashed lines; see Table 2). H atoms not involved in the hydrogen bonding have been omitted for clarity.

Upon chelation to the Ni^{II} ion, the ligands underwent deprotonation from the tautomeric thiolates and their negative charges are delocalized over atoms N1–N2–C9–S1 and N4–N5–C22–S2. Consequently, the bond lengths S1–C9 in one ligand and S2–C25 in the other ligand are 1.728 (3) and 1.735 (3) Å, respectively, which are consistent with single-bond character (Sankaraperumal *et al.*, 2013). Furthermore, the Ni–N [1.922 (2) and 1.928 (2) Å] and Ni–S bond lengths [range 2.1489 (10) and 2.1518 (10) Å] are consistent with those in similar reported compounds. The S–C [1.728 and 1.735 (3) Å] and N–C [1.293 (3) and 1.294 (3) Å] bond lengths of the ligand are consistent with literature values (Sankaraperumal *et al.*, 2013; de Oliveira *et al.*, 2014).

Notably, two anagostic interactions in the *trans*-arrangement are observed in the title complex between the nickel(II) ion and the aromatic C–H groups (Fig. 2). The Ni1···H1A and Ni1···H17A distances are 2.616 and 2.527 Å, respectively, which are shorter than the van der Waals radii sum for Ni (1.63 Å; Bondi, 1964) and H (1.10 Å; Rowland & Taylor, 1996). In addition, the Ni1–H1A–C1 and Ni1–H17A–C17 bond angles are 109.6 and 112.7°, respectively. These observed values of contact distances and bond angles fall in the range

for anagostic interactions reported by Brookhart *et al.* (2007). Similar observations have been reported recently by de Oliveira *et al.* (2014).

3. Supramolecular features

The crystal structure of (I) contains a network of C—H···O interactions (Table 2). First the interaction C16—H16A···O1 links pairs of molecules to form inversion dimers enclosing centrosymmetric *R*₂²(10) ring motifs, as shown in Fig. 3. These dimers are further linked by C21—H21A···O2 interactions, resulting in infinite chains along [100] (Fig. 4). In addition, a C—H···π interaction is also present (Table 2).

4. Synthesis and crystallization

The title complex was prepared by adding a solution of acetophenone-4-benzoyl-3-thiosemicarbazone (75 mg; 0.25 mmol) in dichloromethane (10 mL) dropwise to a stirred solution of nickel(II) nitrate hexahydrate (47.5 mg; 0.26 mmol) in 2-propanol (10 mL) in a small beaker. The resulting mixture solution was stirred continuously for 1 h at 318–323 K. The resultant green precipitate was separated by vacuum filtration, washed with 2-propanol and then with ether, and dried in a vacuum desiccator over dry silica gel. Single crystals suitable for X-ray analysis were obtained after slow evaporation of a dichloromethane solution saturated

with 2-propanol. Yield; 52.5 mg, 65%. Melting point: 521–523 K.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The H atoms attached to nitrogen were located in difference Fourier maps and freely refined. The remaining H atoms were positioned geometrically and refined using a riding model with C—H = 0.95–0.98 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{C-methyl})$. A rotating group model was applied to the methyl groups.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Hydrogen-bond geometry (Å, °)

Cg1 is the centroid of the C27—C32 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C16—H16A···O1 ⁱ	0.95	2.51	3.306 (5)	141
C21—H21A···O2 ⁱⁱ	0.95	2.60	3.522 (4)	165
C19—H19A···Cg1 ⁱⁱⁱ	0.95	2.86	3.400 (4)	117

Symmetry codes: (i) -x+1, -y, -z; (ii) x+1, y, z; (iii) -x+1, -y+1, -z.
