Edited by H. Stoeckli-Evans, University of Neuchâtel, Switzerland

In the title molecule,  $C_{16}H_{12}Cl_2O_2Se$ , the C—Se—C angle is  $100.05 (14)^\circ$ , with the dihedral angle between the planes of the benzene rings being  $69.92 (17)^\circ$ . The average endocyclic angles (Se—C<sub>ar</sub>—C<sub>ar</sub>; ar = aromatic) facing the Se atom are  $120.0 (3)$  and  $119.4 (3)^\circ$ . The Se atom is essentially coplanar with the benzene rings, with Se—C<sub>ar</sub>—C<sub>ar</sub>—C<sub>ar</sub> torsion angles of  $-179.2 (3)$  and  $-179.7 (3)^\circ$ . In the crystal, molecules are linked via C—H···O hydrogen bonds forming chains propagating along the *a*-axis direction. The chains are linked via C—H···π interactions, forming a three-dimensional network.

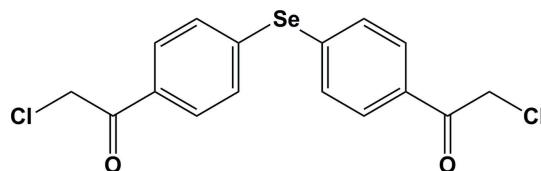

**Keywords:** crystal structure; organoselenium; selenium; C—H···O hydrogen bonds.

## Crystal structure of 1,1'-[selanediylbis(4,1-phenylene)]bis(2-chloroethan-1-one)

**Hazem Bouraoui, Ali Boudjada, Noudjoud Hamdouni, Youcef Mechehou and Jean Meinnel**

### S1. Comment

During the last few years, organoselenium chemistry (Procter, 2001) has been the subject of constant scientific interest and organoselenium compounds have been used intensively as important reagents and intermediates in organic synthesis (Zade *et al.*, 2005). Moreover, organoselenium compounds are of considerable interest as anti-cancer (Zhu & Jiang, 2008), anti-oxydant (Anderson *et al.*, 1996), anti-inflammatory, and antiallergic agents (Abdel-Hafez, 2008) and they are key intermediates for the synthesis of pharmaceuticals (Woods *et al.*, 1993), fine chemicals and polymers (Hellberg *et al.*, 1997). Selenium compounds have been found to play important roles in protecting the heart, preventing cancer and cardiovascular diseases (Yang *et al.*, 2005). Because selenium functions as an antioxidant it works in conjunction with vitamin E (Ellis *et al.*, 1984).

In the title compound, Fig. 1, the C1—Se1—C7 angle is 100.05 (14) °, similar to the value observed in two very similar compounds, viz. ca 99.47 ° in bis(4-nitrophenyl)selenide (Zuo, 2013), and 99.59 (14)° in bis(4-acetylphenyl) selenide (Bouraoui *et al.*, 2011) where the Se atom lies on a two-fold rotation axis. In the title compound the two benzene rings are inclined to one another by 69.92 (17) °. This is similar to the same angle observed for the 4-nitrophenyl derivative, ca 63.77 °, but considerably different to that observed for the acetylphenyl derivative, viz. 87.08 (15) °.

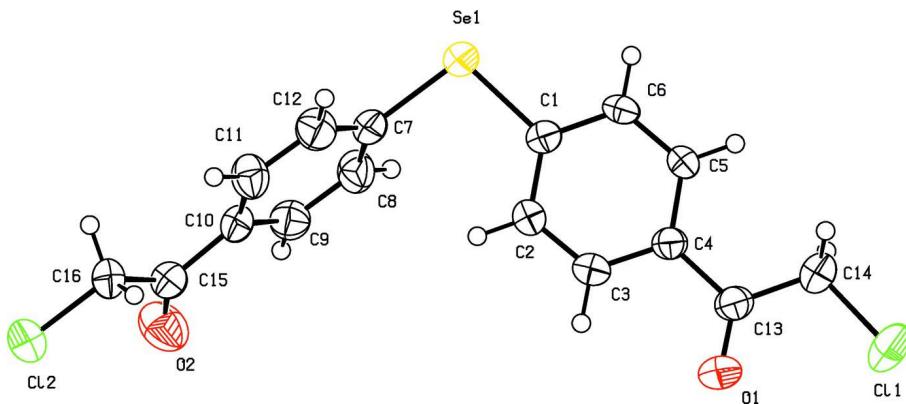

In the crystal of the title compound, molecules are linked by C—H···O hydrogen bonds forming chains along the *a* axis direction (Table 1 and Fig. 2). The chains are linked by C—H···π interactions (Table 1) forming a three-dimensional structure.

### S2. Synthesis and crystallization

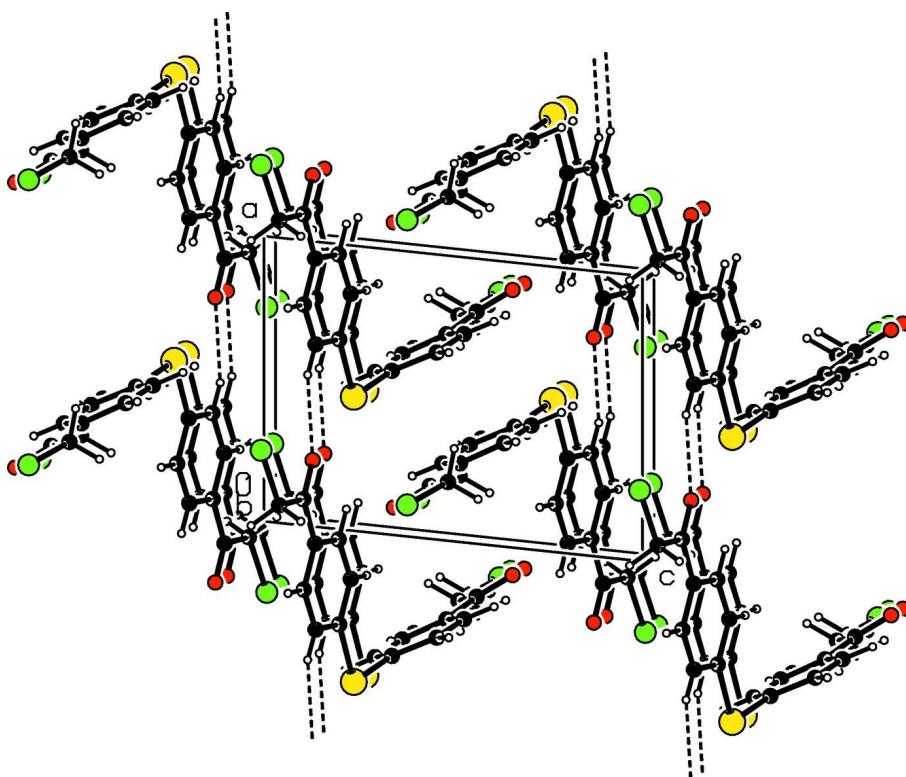

The title compound was prepared according to a method proposed by (Mechehoud *et al.*, 2010). Methylene chloride acyl chloride, ClCH<sub>2</sub>COCl, (36.5 mmol) and anhydrous aluminium chloride 5 g (37.5 mmol, 3 eq) were taken in dry CH<sub>2</sub>Cl<sub>2</sub> (100 ml). The reaction mixture was cooled to 273–278 K, protected from atmospheric moisture, and stirred continuously for 15 min. A solution of diphenyl selenide (1) 3 g (1.87 mmol) in CH<sub>2</sub>Cl<sub>2</sub> was added drop wise over a period of 5 min. The reaction mixture was allowed to reach room temperature gradually and then stirred at this temperature overnight. The solution was then washed with ice water-HCl (80 ml) and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was separated and dried (Na<sub>2</sub>SO<sub>4</sub>). Removal of the solvent under reduced pressure afforded the crude product which was recrystallized from ether-petrol to yield 4.2 g of the title compound. Yellow single crystals suitable for X-ray diffraction were obtained by recrystallization from CH<sub>2</sub>Cl<sub>2</sub>.

### S3. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All the H atoms were localized in difference Fourier maps but introduced in calculated positions and treated as riding atoms: C—H = 0.93–0.97 Å with U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(C).

**Figure 1**

The molecular structure of the title compound, with atom labelling. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Crystal packing of the title compound, viewed along the *b* axis. The hydrogen bonds are shown as dashed lines (see Table 1).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

*Hydrogen-bond geometry ( $\text{\AA}$ ,  $^\circ$ )*

Cg1 and Cg2 are the centroids of benzene rings C1-C6 and C7-C12, respectively.

$D—\text{H}\cdots A$	$D—\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D—\text{H}\cdots A$
C6—H61 $\cdots$ O1 <sup>i</sup>	0.93	2.41	3.288 (4)	158
C16—H161 $\cdots$ Cg2 <sup>ii</sup>	0.97	2.82	3.611 (4)	140
C16—H162 $\cdots$ Cg1 <sup>iii</sup>	0.97	2.92	3.749 (4)	144

Symmetry codes: (i)  $x+1, y, z$ ; (ii)  $-x+1, -y+1, -z+1$ ; (iii)  $x, y+1, z$ .
