Received 23 June 2010; accepted 28 June 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.050; wR factor = 0.147; data-to-parameter ratio = 19.5.

Molecules of the title compound, $C_{11}\text{H}_{10}\text{ClN}$, are essentially planar (r.m.s. deviation for all non-H atoms = 0.009 Å) and are stacked along the a axis with the centroids of the benzene and pyridine rings alternately separated by 3.649 (1) and 3.778 (1) Å.

4-Chloro-2,5-dimethylquinoline

K. Prabha, K. N. Vennila, K. J. R. Prasad and D. Velmurugan

Comment

This paper presents the first crystal structure of *meta* isomer of chloro-quinoline derivatives. It was reported earlier that the introduction of methyl group at the 5th position of quinoline nucleus enhanced characteristically the antibacterial activity against Gram-positive bacteria, including *Streptococcus pneumonia*, which is a major pathogen in the respiratory tract infection (Miyamoto *et al.*, 1995). Also quinoline derivatives are well known to have many biological activities such as anti-malarial (Milner *et al.*, 2010), inhibition of melanogenesis (Li *et al.*, 2008), antifungal (Musiola *et al.*, 2006), antibacterial activities etc. (Muthumani *et al.*, 2010).

The non-hydrogen atoms of the title molecule are essentially coplanar (r.m.s. deviation 0.009 Å). The molecules are stacked along the *a* axis with the centroids of quinoline ring systems alternately separated by 3.649 (1) Å and 3.778 (1) Å (Fig.2).

Experimental

Ethylacetacetate (0.25 mol) and *m*-toluidine (0.25 mol) were mixed. 5–10 drops of dilute hydrochloroacid (1:1) was added, the mixture was shaken well and kept inside a vacuum desiccator over concentrated sulfuric acid for 2 d. A deep yellow oily liquid, (*E*)-Ethyl-3-(*m*-tolylamino)but-2-enoate, was formed. It was dried over anhydrous sodium sulfate and was added dropwise from a dropping funnel to diphenyl ether (50 ml) kept at reflux in a two necked flask, one fitted with the dropping funnel and the other with an air condenser to distill off the ethanol formed during the reaction. After the addition, the refluxing was continued for further 10 min and the contents were cooled. 50 ml of petroleum ether was added and the precipitated solid was collected, washed with petroleum ether, dried and recrystallized from ethanol to give (*E*)-ethyl-3-(*m*-tolylamino)but-2-enoate as a crystalline white powder.

Phosphorous oxy chloride (100 ml) was added to 2,5-dimethylquinolin-4 (1*H*)-one (0.1 mol) and kept on a water bath for about 1 h and poured into ice water and neutralized with saturated sodium carbonate solution. The formed precipitate was filtered, dried, purified using silica gel column chromatography and eluted with petroleum ether (100%) to get a white solid. It was recrystallized using methanol.

Refinement

H atoms were positioned geometrically [C–H = 0.93 or 0.96 Å] and were allowed to ride on their parent atoms, with $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$ for methyl H and $1.2U_{\text{eq}}(\text{C})$ for other H atoms.

$c = 10.4306 (11) \text{ \AA}$	$T = 293 \text{ K}$
$\beta = 99.239 (8)^\circ$	Block, colourless
$V = 936.09 (19) \text{ \AA}^3$	$0.27 \times 0.26 \times 0.22 \text{ mm}$
$Z = 4$	

Data collection

Bruker SMART APEXII area-detector diffractometer	2345 independent reflections
Radiation source: fine-focus sealed tube graphite	1502 reflections with $I > 2\sigma(I)$
ω and ϕ scans	$R_{\text{int}} = 0.027$
Absorption correction: multi-scan (<i>SADABS</i> ; Bruker, 2008)	$\theta_{\text{max}} = 28.5^\circ, \theta_{\text{min}} = 2.5^\circ$
$T_{\text{min}} = 0.909, T_{\text{max}} = 0.925$	$h = -9 \rightarrow 9$
8798 measured reflections	$k = -17 \rightarrow 12$
	$l = -13 \rightarrow 10$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
---------------------	--

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.050$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.147$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0468P)^2 + 0.6973P]$ where $P = (F_o^2 + 2F_c^2)/3$
2345 reflections	$(\Delta/\sigma)_{\max} = 0.007$
120 parameters	$\Delta\rho_{\max} = 0.23 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.21 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
