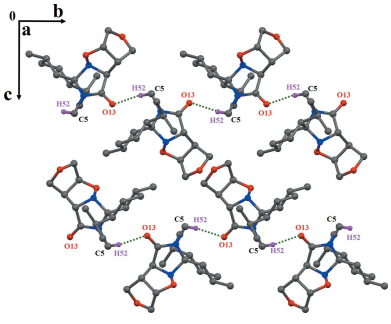
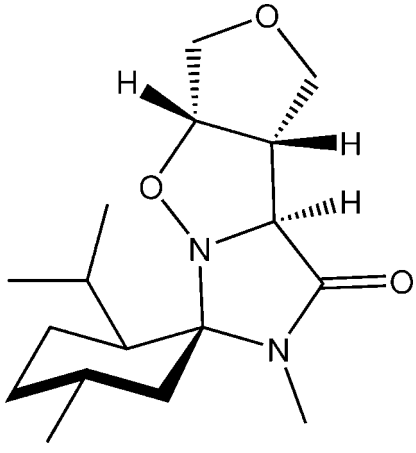
Supporting information: this article has supporting information at journals.iucr.org/e

In the title compound, $C_{17}H_{28}N_2O_3$, the isoxazolidine ring adopts an envelope conformation with the O atom deviating from the mean plane of the other four ring atoms by 0.617 (1) Å. In the crystal, molecules are linked *via* weak C—H···O hydrogen bonds, forming chains which extend along the *b*-axis direction.

1. Chemical context

The 1,3-dipolar cycloaddition of nitrones to alkenes has been applied to produce substituted isoxazolidines (Gothelf & Jørgensen, 1998). These compounds can be converted into *β*-amino alcohols (Padwa *et al.*, 2002), *β*-lactams (Hanselmann *et al.*, 2003) and *α*-amino acids (Aouadi *et al.*, 2006), by reductive cleavage of the N—O bond. Consequently, isoxazolidines have been used as key intermediates for the synthesis of various natural products or antifungal, anti-inflammatory, anti-mycobacterial, anti-tuberculosis and anti-viral agents. The previously mentioned importance of the isoxazolidine substructure led us to investigate the cyclo-addition of chiral nitrone [(5(*S*),6(*S*),9(*R*)-6-isopropyl-4,9-dimethyl-3-oxo-1,4-diazaspiro[4.5]dec-1-ene-1-oxide] with 2,5-dihydrofuran. The present work reports the synthesis and the X-ray crystallographic study of this substituted isoxazolidine, the title compound, $C_{17}H_{28}N_2O_3$, (I).





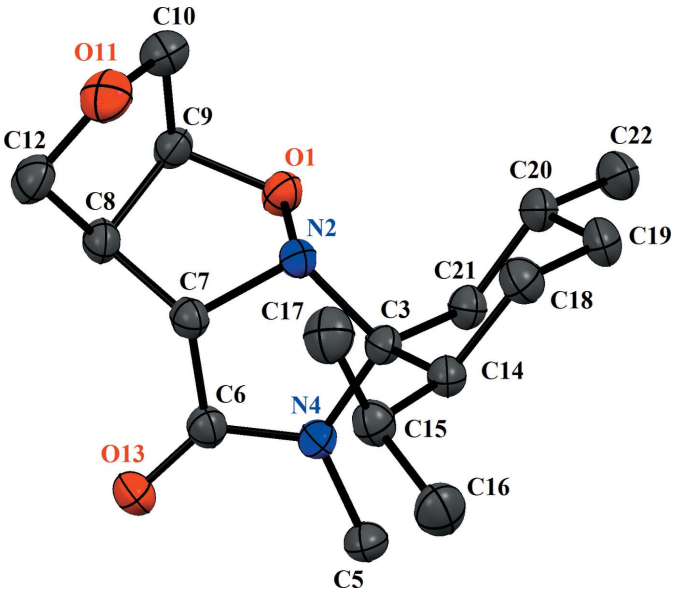


Figure 1
The molecular conformation in the molecules of (I), showing the atom labelling. Displacement ellipsoids are drawn at the 35% probability level. H atoms have been omitted for clarity.

2. Structural commentary

In the title compound (I), the asymmetric unit comprises a single molecule (Fig. 1). Each molecule has six stereogenic centres (Abda *et al.*, 2014) although the absolute configuration for the molecule was not determined definitively in this analysis. The isoxazolidine ring (O1/N2/C7–C9) adopts an envelope conformation with atom O1 displaced by 0.617 (1) Å from the mean plane through atoms N2/C7–C9. The N—O bond lengths of the isoxazolidine rings O1—N2 = 1.482 (2) Å, close to values reported for related compounds (Loh *et al.*, 2010; Molander *et al.*, 2013).

Table 1
Hydrogen-bond geometry (Å, °).

D—H···A	D—H	H···A	D···A	D—H···A
C5—H52···O13^{i}	0.97	2.57	3.536 (3)	172

Symmetry code: (i) $-x+1, y-\frac{1}{2}, -z+\frac{1}{2}$.

3. Supramolecular features

In the crystal, the molecules are linked *via* non-classical weak C5—H52···O13^{i} hydrogen bonds, forming zigzag chains, which extend along the *b*-axis direction (Table 1 and Fig. 2).

4. Synthesis and crystallization

In a Biotage Initiator 10 ml vial, nitrone [(5(*S*),6(*S*),9(*R*)-6-isopropyl-4,9-dimethyl-3-oxo-1,4-diazaspiro[4.5]dec-1-ene-1-oxide] (1 eq.) in anhydrous toluene (4 ml) was introduced.

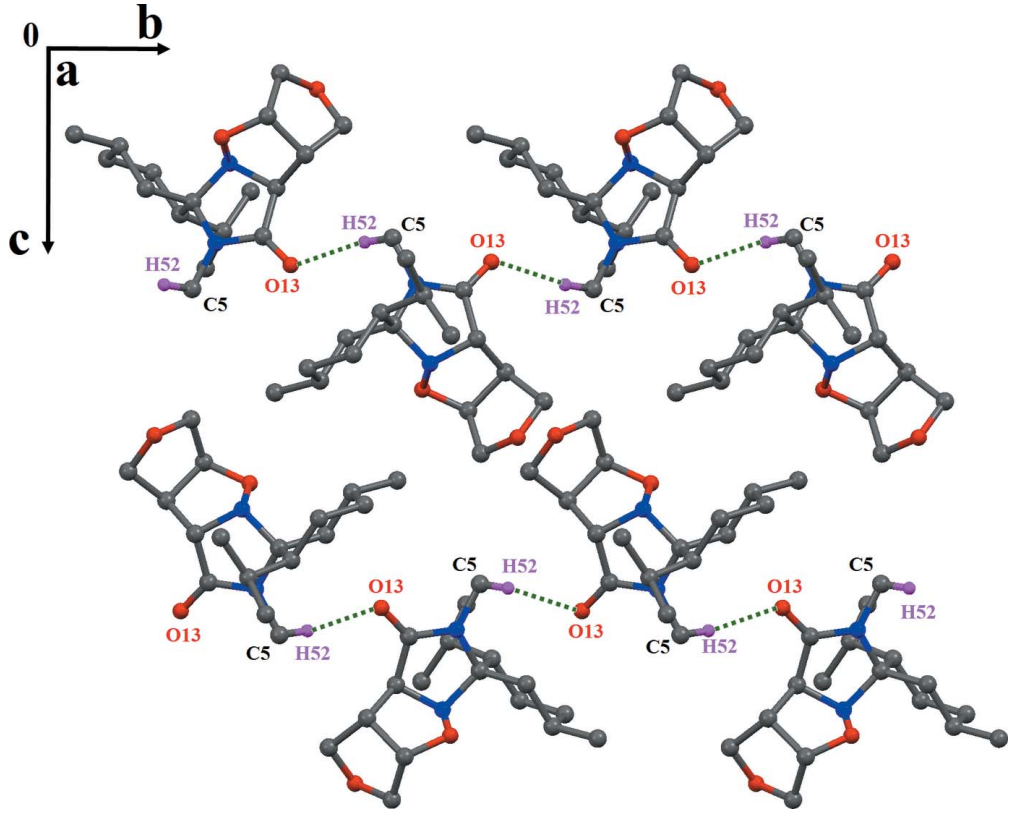

Figure 2
The C—H···O hydrogen-bonded chains extending along the *b* axis in the crystal structure of (I). Dashed lines indicate hydrogen bonds. Non-associated H atoms have been omitted.

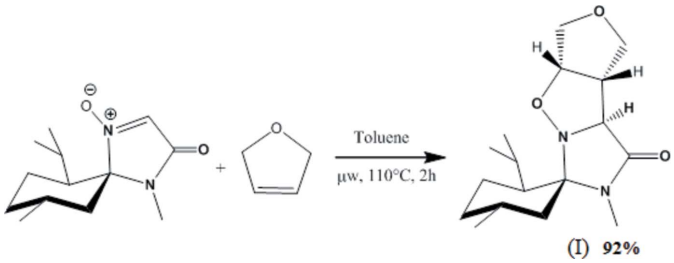

Figure 3
The cycloaddition reaction in the synthesis of (I).

The vial was flushed with argon and 2,5-dihydrofuran (3 eq,) was added. The vial was sealed with a septum cap and was irradiated with microwaves (temperature: 373 K) (Fig. 3). TLC monitoring (EtOAc/PE 5/5) showed full conversion after 2 h. After the crude mixture was concentrated and purified by flash column chromatography (silica gel, EtOAc/PE 5/5), the desired isoxazolidine (I) was obtained (m.p. = 410–411 K).

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The H atoms were located in a difference map, but these were repositioned geometrically and were initially refined with soft restraints on the bond lengths and angles to regularize their geometry (C—H in the range 0.93–0.98 Å) and U_{iso}(H) (in the range 1.2–1.5 times U_{eq} of the parent atom). These were subsequently refined with riding constraints (Cooper *et al.*, 2010). Although not definitive for this chiral structure, the Flack (1983) absolute structure parameter obtained [0.60 (3) for 1261 Friedel pairs] gave C3(*S*), C7(*S*), C8(*S*), C9(*S*), C14(*S*), C20(*R*) assignments for the six arbitrarily named chiral centres in the molecule. The inverted structure gave a similarly high Flack factor .

Absolute structure parameter: 0.6 (3)

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems open-flow nitrogen cryostat with a nominal stability of 0.1K.

Refinement. The analytical numeric absorption correction using a multi-faceted crystal model is based on expressions derived by Clark & Reid (1995). The relatively large ratio of minimum to maximum corrections applied in the multi-scan process (1:nnn) reflect changes in the illuminated volume of the crystal. Changes in illuminated volume were kept to a minimum, and were taken into account (Görbitz, 1999).
