Background: MicroRNA-562 (miR-562) has been found to possess anti-cancer function in certain tumors. However, the function of miR-562 in glioblastoma (GBM) is still not fully understood.

Purpose: The aim at present study is to analyze the function of miR-562 and its possible target in GBM cells.

Patients and methods: In the present study, a total of 80 GBM samples and 16 adjacent noncancerous tissues were used to examine the expression of miR-562 and c-MET. In order to gain a deep insight into the molecular network of miR-562 and c-MET in GBM, the miR-562 mimic and inhibitor were transfected into two GBM cell lines (U251 and U87), respectively. Meanwhile, lentiviral vector was used to mediate overexpression of c-MET. Cell proliferation was examined via Cell Counting Kit-8 (CCK-8) assays. Meanwhile, cell apoptosis was analyzed by Annexin V-FTTC/PI staining assay.

Results: Our results indicated that the level of miR-562 was downregulated in GBM tissues and the expression of c-MET was upregulated in tumors. Cell proliferation analysis indicated that miR-562 was an anti-proliferation effector in GBM cells. Moreover, cell apoptosis analysis suggested the pro-apoptosis function of miR-562 in GBM cells.

Conclusion: Our results demonstrated that miR-562 negatively regulated the c-MET/AKT signal pathway. In addition, caspase-3 might also serve as another target for miR-562 in GBM cells. This research not only obtained a deep understanding of miR-562 but also provided evidence in terms of developing new prognostic biomarker for GBM.

Keywords: glioblastoma, miR-562, c-MET, AKT, p-AKT, caspase-3

Introduction

Glioblastomas (GBMs) are one of the malignant brain tumors all over the world that are most commonly diagnosed in adults.¹ More than half of GBM sufferers died within 1 year because of its worst prognosis. Much attention has been paid to determining the effective therapy method for GBM. However, the survival rate of GBM patients is still very low.²⁻⁴ Therefore, gaining a deep insight into the GBM molecule mechanisms is urgently needed.

MicroRNAs (miRs) are a group of small noncoding RNAs, which serve as a valuable post-transcription mediator through binding on the 3'UTRs of the targeting miRs.^{5,6} Growing evidence has indicated that miRs play an essential regulatory role in tumorigenesis and cellular processes of GBM.⁷⁻⁹ Reports have demonstrated that miR-562 is downregulated in Wilms tumor, which is capable of inducing tumorigenesis.¹⁰ However, it is rather less known about the function of miR-562 in GBM.

c-MET is the receptor for hepatocyte growth or scatter factor, which is mapped on chromosome 7 at band 7q21-q31.¹¹ The c-MET receptor plays a critical role in many human cancers. Previous report has indicated that knockdown of the expression of c-MET leads to the inhibition of cell growth and the induction of apoptosis in GBM cells.¹² Moreover, c-MET has been suggested as a direct target of miR-449b-5p and

miR-410 in the pathogenesis of GBM.^{13,14} Therefore, there is a close relationship between c-MET and miRs in GBM. However, whether there is a correlation between c-MET and miR-562 in GBM is still not clear.

Cleaved caspase-3 belongs to the cysteine protease family, which is the active form of caspase-3.¹⁵ Previous report has indicated that cleaved caspase-3 shows the potential value as a biomarker for tumor prognosis.¹⁶ Moreover, cleaved caspase-3 contributes to the apoptosis process in tumor.¹⁷ In addition, cleaved caspase-3 has the function to inhibit chemical-induced hepatocarcinogenesis.¹⁸ However, it is still less known about the molecular network of cleaved caspase-3 in GBM cells.

The AKT pathway plays an important role in various biological functions, which is usually abnormal in human cancer.¹⁹ The phosphorylation of AKT (p-AKT) is essential for its biological function. Previous report has indicated that the p-AKT correlates with the activity of AKT in human non-small-cell lung cancer.²⁰ Moreover, the PI3K/AKT pathway has participated in the cell cycle and apoptosis of lung cancer cells.²¹ Co-activation of AKT and c-MET has triggered rapid hepatocellular cancer in mice.²² Therefore, it is valuable to examine the function of AKT in GBM cells.

In this study, we systemically analyzed the function of miR-562 and its possible target gene in GBM cells. Our research not only gained a deep insight into the molecular network of miR-562 but also provided evidence in terms of developing a new prognostic biomarker for GBM.

Materials and methods

Tissue specimen and cell culture

GBM samples (n=80) and adjacent noncancerous tissues (n=16) were obtained from Huzhou Central Hospital, Huzhou, Zhejiang, P.R. China. Samples were snap-frozen in liquid nitrogen, stored at -80°C for further analysis. All patients were informed and gave written consent. This study was approved by the independent ethics committee of Huzhou Central Hospital, Huzhou, Zhejiang and was in accordance with the Declaration of Helsinki. The median expression value of miR-562 was used to define the high expression group (above the median) and the low expression group (below the median).

The GBM cell lines (U87 and U251) used in this study were obtained from cell bank of Shanghai Biology Institute (Shanghai, P.R. China). A 10% FBS (Thermo Fisher Scientific) mixed into all culture media, 2 mM L-glutamine, and 1% penicillin/streptomycin (Solarbio, Beijing, P.R. China). Cells were grown in DMEM (Trueline, Kaukauna, WI, USA) and were maintained under a 5% CO_2 atmosphere, at 37°C .

RNA isolation and real-time PCR

Total RNA from GBM samples was extracted by TRIzol Reagent (Invitrogen, Waltham, MA, USA). Then, RNA was reverse transcribed into cDNA by cDNA synthesis kit (Thermo Fisher Scientific, Waltham, MA, USA) according to the manufacturer's instructions. The conditions of real-time PCR were as follows: 95°C for 10 minutes followed by 40 cycles of 95°C for 15 seconds, 60°C for 45 seconds and normalized to glyceraldehyde 3-phosphate dehydrogenase. The gene relative expression was calculated by the $2^{-\Delta\Delta\text{Ct}}$ method. All data represent the average of three replicates. The primers used in this study were listed in Supplementary material S1.

Western blot

Whole protein lysates were extracted from indicated cells (U87 and U251) by RIPA lysis buffer (JRDUN, Shanghai, P.R. China) with EDTA-free Protease inhibitor Cocktail (Roche, Heidelberg, Germany). The concentration was estimated by an enhanced BCA protein assay kit (Thermo Fisher Scientific). Equal amounts of total protein (25 μg) were fractionated on 10% SDS-PAGE and transferred to a nitrocellulose membrane (Millipore, Billerica, MA, USA) overnight. Then, after being blocked with 5% nonfat dry milk for 1 hour at room temperature, the membranes were probed at 4°C overnight with the primary antibodies followed by secondary antibody anti-mouse IgG (1:1,000; Beyotime, Shanghai, P.R. China) for 1 hour at 37°C . An enhanced chemiluminescence system (Tanon, Shanghai, P.R. China) was used for detection protein expression value. All the detail information of primary antibodies was provided in Table S1. The caspase-3 inhibitor Z-VAD was purchased from Selleck, Houston, TX, USA.

Cell transfection

The miR-562 mimics, inhibitor, and negative control (NC) were purchased from GenePharma (Shanghai, P.R. China). Cells were grown on 80% confluence prior to transfection. Transfection of the miR-562 mimics or inhibitor into glioma U251 and U87 cells was performed by using Lipofectamine 2000 (Invitrogen) according to the manufacturer's protocol. After 48 hours posttransfection, transfection efficacy was measured by qRT-PCR or Western blot. The sequence information was provided in Table S2.

Lentiviral-mediated overexpression of c-MET

Lentiviral plasmid (pLVX-puro) containing the full length of human c-MET (BC130420.1) cDNA sequence and the

empty plasmid acted as its overexpressing negative control (oeNC). All of them were transiently transfected into cells by Lipofectamine 2000 (Invitrogen) according to the instruction of the manufacturer. Experiments were performed 48 hours after being transfected.

Cell proliferation assay

Cell Counting Kit-8 (CCK-8) assay kits (SAB, College Park, MD, USA) was used to examine cell proliferation according to the protocol of the manufacturer. Briefly, cells transfected as indicated were seeded in 96-well plates and cultured for 0, 24, 48, and 72 hours, CCK-8 solution (1:10) was mixed to each well and incubated for 1 hour. Microplate reader (Pulangxin, Beijing, P.R. China) was used to measure the ODs at wave length 450 nm. Triplicates were performed at each time point.

Cell apoptosis assay

In brief, cells (U87 and U251) were collected and stained by Annexin V-fluorescein isothiocyanate' apoptosis detection kit (Beyotime) according to the instructions of the manufacturer at 48 hours after viral infection. Then, flow cytometer (BD, San Diego, CA, USA) were used to determine cells. All data represented the average of three replicates.

Dual-luciferase reporter assays

The c-MET 3'-UTR, containing the NC, wild type (WT), and mutated target sequences of miR-562, was cloned into Dual-Luciferase Expression Vector pGL3-Promoter (Promega, Madison, WI, USA) and all vectors were transfected to U87 cells. Then, cells were harvested after 48 hours of transfection and then detected using the Dual-GLO Luciferase Assay Kit (Promega).

Statistical analysis

GraphPad Prism software Version 7.0 (La Jolla CA, USA) was used for statistical analyses. Data were displayed as mean \pm SD for at least three samples. Statistical significance was determined by one-way ANOVA for multiple comparisons. A P -value <0.05 indicates statistical significance.

Results

miR-562 negatively correlated with c-MET in GBM tissues

The expression level of miR-562 and c-MET was examined by qRT-PCR in 80 GBM tissues and 16 normal brain samples, respectively. As shown in Figure 1A, the expression level of miR-562 was significantly downregulated in GBM tissues

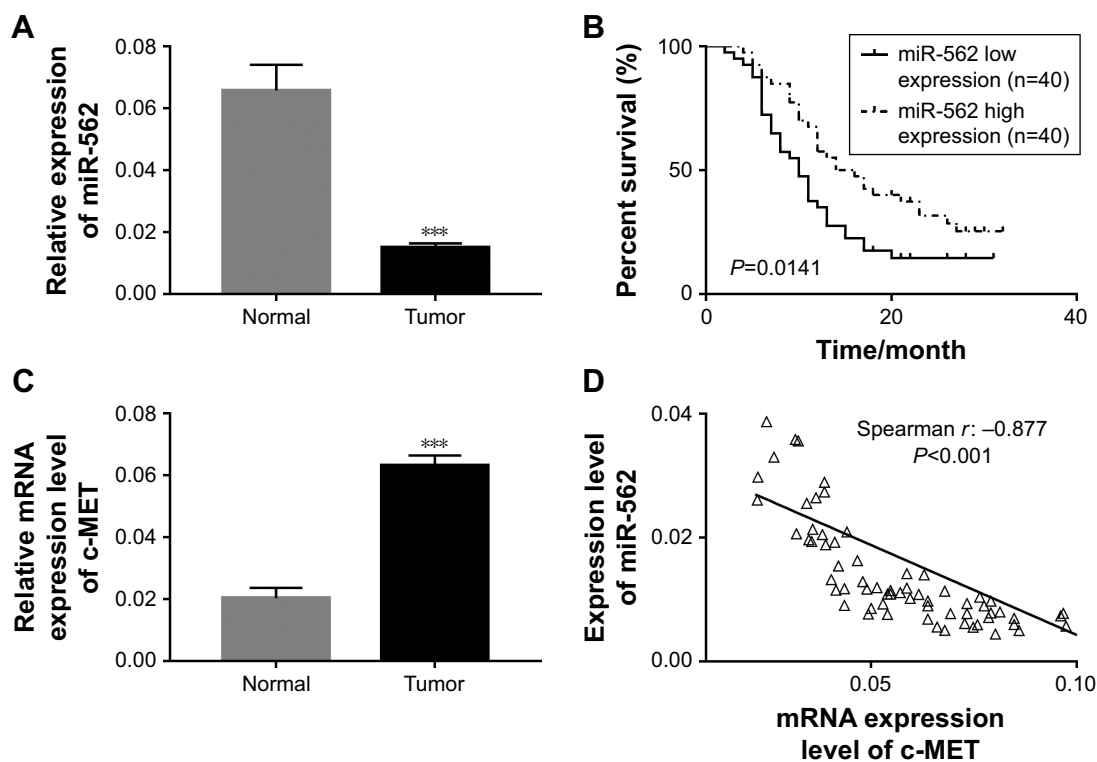

Figure 1 The negative correlation between miR-562 and c-MET in GBM tissues.

Notes: (A) The miR expression level of miR-562 in GBM tissues (n=80) and para-cancerous tissues (n=16). *** $P<0.001$ vs normal. (B) The overall survival time of 80 patients with GBM. (C) The mRNA expression level of c-MET in GBM tissues (n=80) and para-cancerous tissues (n=16). *** $P<0.001$ vs normal. (D) Correlation between the expression of miR-562 and c-MET in GBM samples.

compared with that in normal tissues. Kaplan–Meier survival analysis (Figure 1B) indicated that the survival time of patients with higher expression of miR-562 was significantly longer than that of patients with lower miR-562 expression ($P < 0.05$). On the contrary, the level of c-MET was significantly higher in GBM than that of normal tissues (Figure 1C). Moreover, Spearman correlation analysis indicated a negative correlation between miR-562 and c-MET (Figure 1D).

miR-562 suppressed cell proliferation and induced cell apoptosis in GBM cells

In order to investigate the effect of miR-562 on cell proliferation and cell apoptosis, we utilized gain-of-function

and loss-of-function assay by transiently transfecting the miR-410-3p mimic and inhibitor, as well as their NC into U87 and U251 cells, respectively. The untreated cells served as blank control (BLANK).

As shown in Figure 2A and B, overexpression of miR-562 strongly inhibited the expression of c-MET. On the other side, the expression of c-MET was significantly upregulated in miR-562 inhibitor transfected cells. Then, cell proliferation was examined via CCK-8 assays among different transfected cells as indicated. From the results, the cell proliferation rate was deeply suppressed in miR-562 mimic transfected cells compared with that of NC cells. Meanwhile, the miR-562 inhibitor transfected cells showed a significantly upregulated

in cell proliferation. Therefore, miR-562 inhibited the proliferation of GBM cells (Figure 2C and D). Next, cell apoptosis was analyzed by Annexin V-FITC/PI staining assay among different transfected cells as indicated, the cell apoptosis ratio of miR-562 mimic transfected cells was significantly increased compared with that of NC cells in U87 and U251 cell lines, which reflected the pro-apoptosis role of miR-562 on GBM cells (Figure 2E and F).

In addition, Western blot was performed to determine the protein level of c-MET, AKT, p-AKT, and cleaved caspase-3 in the cells as indicated. As shown in Figure 2G and H, the protein level of c-MET was significantly decreased in miR-562 mimic transfected cells and showed a negative correlation with miR-562. Moreover, our results suggested that the p-AKT was deeply suppressed by miR-562. In addition to that the protein level of cleaved caspase-3 presented a positive correlation with the expression of miR-562 in GBM cells.

c-MET neutralized the effect of miR-562 on GBM cells

To further explore the connection between c-MET and miR-562, U87 cells was transfected with a plasmid over-expressing c-MET (oec-MET), mock plasmid (oeNC), and mock plasmid with miR-562 NC (NCV). As shown in Figure 3A and B, the mRNA and protein level of c-MET was significantly upregulated in oec-MET transfected cells compared with oeNC transfected cells. Moreover, the cell proliferation rate was significantly upregulated in oec-MET transfected cells. However, this effect was deeply neutralized by miR-562 mimic (Figure 3C). As shown in Figure 3D, the cell apoptosis rate was downregulated in oec-MET transfected cells compared with that of NCV and miR-562 mimic transfected cells. Interestingly, the cell apoptosis rate showed no significant difference between oec-MET and miR-562 mimic + oec-MET transfected cells. However, the cell apoptosis rate of the double-transfected (miR-562 mimic + oec-MET) cells was significantly decreased compared with miR-562 mimic, which indicated that the c-MET suppressed the effect of miR-562 on cell apoptosis. Taken together, these results suggested that c-MET neutralized the effect of miR-562 on GBM cells.

In addition, some highly conserved regions in 3'-UTR of c-MET were investigated using miRDB database (<http://www.mirdb.org>), and predicted the possible binding sites for miR-562. To further determine the interaction between c-MET and miR-562, luciferase reporters that contained the WT or mutant 3'-UTR of c-MET was generated (Figure 3E).

As shown in Figure 3F, the results showed that the luciferase activity of the WT c-MET 3'-UTR reporter vector was markedly decreased by miR-562 mimic and significantly enhanced by miR-562 inhibitor. However, the luciferase activity of the mutant 3'-UTR of c-MET reporter vector showed no significant difference among different transfected cells. Taken together, these results indicated that miR-562 regulated c-MET expression by directly binding on its 3'-UTR. In addition, Western blot was used to examine the protein level of c-MET, AKT, p-AKT, and cleaved caspase-3 in different transfected cells as indicated. Our results suggested that miR-562 inhibited the expression of c-MET and p-AKT in GBM cells. Meanwhile, the level of cleaved caspase-3 was positively correlated with the expression of miR-562 in GBM cells (Figure 3G).

The effect of miR-562 was suppressed by a specific caspase-3 inhibitor Z-VAD on GBM cells

In order to further examine the correlation between miR-562 and caspase-3, a specific caspase-3 inhibitor Z-VAD was used to culture the miR-562 mimic transfected cells. As shown in Figure 4A, the protein level of cleaved caspase-3 was deeply downregulated in Z-VAD cultured cells compared with that of miR-562 mimic transfected cells. Moreover, the cell apoptosis rate also showed significantly decreased in Z-VAD-treated cells (Figure 4B). These results indicated that miR-562 might regulate the apoptosis of GBM cells through activating caspase-3.

Discussion

As in the case of common malignant brain tumors, the survival rate of GBM is usually limited to 2 years. Although the traditional therapy (tumor resection and radiotherapy) can help to fight against the development of GBM, the prognosis is usually disappointing. Therefore, gaining a deep insight into the molecular mechanism of GBM would contribute to develop novel therapy approach for its treatment.

In the present study, we systemically analyzed the function of the miR-562 on GBM cells. In order to obtain a reliable result, the miR-562 mimic and inhibitor were used for overexpression and suppression of miR-562. Results from these two experimental phases were in agreement. Hence, our results were more understandable.

From the CCK-8 assay, the cell proliferation rate was deeply suppressed in miR-562 mimic transfected cells, which was upregulated in miR-562 inhibitor transfected cells. Therefore, these results demonstrated the anti-proliferation function of miR-562. Apoptosis is the basic essential process

for eliminating damaged or unnecessary cells. Dysregulation of the apoptotic pathway has been confirmed as a key event in cancer development and progression.²³ In this study, results from cell apoptosis assay indicated a pro-apoptosis role of miR-562 in GBM cells. Taken together, these results indicated the potential value of miR-562 as a promising prognostic biomarker for GBM.

The c-MET signaling pathway is essential for cell proliferation and apoptosis. Overexpression of c-MET often leads to the tumor growth. Therefore, inhibiting the expression

of c-MET is believed as a promising target for cancer treatment. Growing evidence has indicated that miRs are a novel and additional system to regulate c-MET expression in tumors.²⁴ Previous reports have demonstrated that miR-139-5P and miR-206 inhibit proliferation and causes apoptosis through downregulating c-Met in lung cancer cells.^{25,26} Moreover, it has been reported that miR-34a has suppressed the expression of c-MET through binding on its 3'-UTR.²⁷ In addition, miR-23b can recognize four sites in the c-MET 3'-UTR, which decreases the migration and

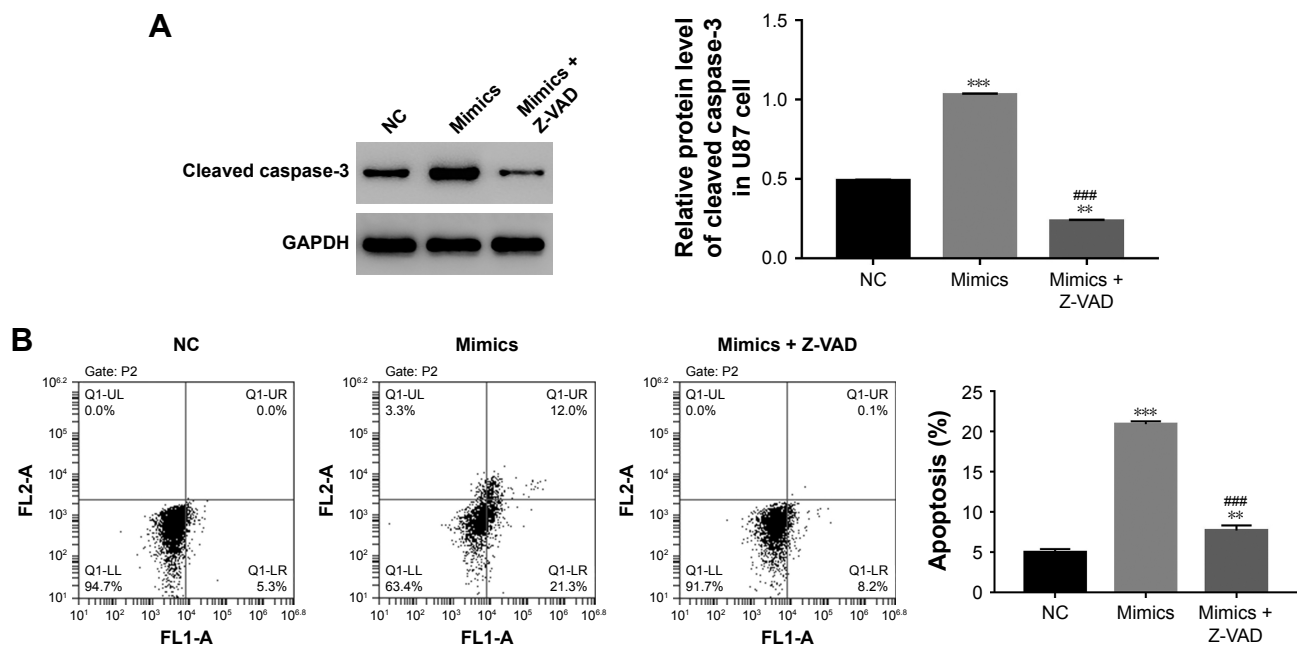

Figure 4 The effect of miR-562 mimic was suppressed by Z-VAD in GBM cells.

Abbreviations: GBM, glioblastoma; miR, microRNA; NC, negative control.

proliferation of hepatocellular carcinoma cells.²⁸ In the present study, our results also reflected that miR-562 negatively regulated the c-MET through binding on its 3'-UTR. Therefore, all these miRs binding sites on the 3'-UTR of c-MET contributed to develop novel approach for certain cancers treatment.

It has been reported that HGF/c-MET/AKT pathway regulates the cell apoptosis process in tumors.²⁹ Previous report has demonstrated that the main function of miR-206 is depended on suppressing the c-MET/AKT signaling pathway.³⁰ In this study, the p-AKT was downregulated by miR-562. Therefore, we suspected that miR-562 might regulate the proliferation and apoptosis of GBM cells via mediating the c-MET/AKT signaling pathway as well. In addition to that the caspase-3 might serve as another target by miR-562 in the apoptosis of GBM cells. Hence, miR-562 might regulate apoptosis through inhibiting the c-MET/AKT pathway and activating the downstream effectors caspase-3.

Conclusion

In this study, we examined the effect of miR-562 mimic and inhibitor on GBM cells. Our results not only gained a better understanding of the miR-562 function but also provided evidence to indicate its potential value as a prognostic biomarker for GBM.

Primer F 5' CGCGCGAAAGTAGCTGTACC 3'

Primer R 5' AGTGCAGGGTCCGAGGTATT 3'

1.2 *Homo sapiens* MET proto-oncogene, receptor tyrosine kinase (MET), transcript variant 2, mRNA

NCBI Reference Sequence: NM_000245.3

Primer F: 5' TTGGGACATCAGAGGGTCG 3'

Primer R: 5' AACAAAGGGTGGGGCAGAG 3'

Pos: 1364–1608

Amplified product: Size: 245 bps

1.3 *Homo sapiens* RNA, U6 small nuclear 1 (RNU6-1), small nuclear RNA NR_004394.1

Primer F: 5' CTCGCTTCGGCAGCACACA 3'

Primer R: 5' AACGCTTCACGAATTTGCGT 3'

Pos: 4–97

Amplified product: Size: 94 bps

Table S1 The primary antibodies information

Antibody name	Source	Dilution factor
c-MET	Abcam, UK	1:500
Caspase-3	Abcam, UK	1:500
AKT	CST, USA	1:1,000
p-AKT	CST, USA	1:2,000
GAPDH	CST, USA	1:2,000

Abbreviations: GAPDH, glyceraldehyde 3-phosphate dehydrogenase; p-AKT, phosphorylation of AKT.

Table S2 The sequence information of miR-562 mimic and inhibitor

Name	Sequence
hsa-miR-562	5'-AAAGUAGCUGUACCAUUUGC-3'
hsa-miR-miR-562 mimic	5'-AAAGUAGCUGUACCAUUUGC-3'
hsa-miR-miR-562 inhibitor	5'-GCAAAUGGUACAGCUACUUU-3'
microRNA NC	5'-CAGUACUUUUGUGUAGUACAA-3'

Abbreviation: NC, negative control.

OncoTargets and Therapy

Publish your work in this journal

OncoTargets and Therapy is an international, peer-reviewed, open access journal focusing on the pathological basis of all cancers, potential targets for therapy and treatment protocols employed to improve the management of cancer patients. The journal also focuses on the impact of management programs and new therapeutic agents and protocols on

Submit your manuscript here: <http://www.dovepress.com/oncotargets-and-therapy-journal>

patient perspectives such as quality of life, adherence and satisfaction. The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
