Received 11 January 2008; accepted 11 February 2008

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.038;  $wR$  factor = 0.087; data-to-parameter ratio = 14.3.

In the title compound,  $[\text{Fe}(\text{C}_5\text{H}_5)(\text{C}_{16}\text{H}_{14}\text{N}_3\text{O}_3)]$ , the pyrazoline ring and the substituted cyclopentadienyl ring are nearly coplanar, with a dihedral angle of  $8.17(2)^\circ$ , while the nitro-substituted benzene ring is twisted out of the pyrazoline ring plane by  $70.76(1)^\circ$ . The molecules in the crystal structure are held together by three intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds. There is also an intramolecular  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bond. The H atoms of the methyl group are disordered equally over two positions.

### 1-Acetyl-3-ferrocenyl-5-(2-nitrophenyl)-2-pyrazoline

G. Turgut Cin, S. Demirel, N. Karadayi and O. Büyükgüngör

#### Comment

Pyrazolines are widely studied as five-membered heterocyclic compounds. Condensation of nitrogen-containing binucleophilic agents with  $\alpha$ - $\beta$  unsaturated ketones is one of the most suitable synthetic pathways for 2-pyrazolines (Kudar *et al.*, 2005), which possess widespread pharmaceutical properties such as antimicrobial (Küçüküzel *et al.*, 2000), anticonvulsant (Karthikeyan *et al.*, 2007), antidepressant Özdemir *et al.*, 2007), antiandrogenic (Amr *et al.*, 2006), antifungal and anti-inflammatory (Guirado *et al.*, 2004) activities. Metallocenes are also known to exhibit a wide range of biological activity. Among them ferrocenyl compounds display interesting antibacterial (Fouda *et al.*, 2007), antitumor (Jaouen *et al.*, 2004), antimalarial and antifungal (Biot *et al.*, 2004) activities. Therefore, incorporation of a ferrocene fragment into a heterocyclic ring may enhance their biological activities or generate new medicinal properties (Fang *et al.*, 2003). As a part of an ongoing investigation of the chemistry of ferrocenyl pyrazolines, the title compound was synthesized and its crystal structure was determined.

The molecular structure of the title compound is shown in Fig. 1. The puckering parameters (Cremer & Pople, 1975) are  $q_2=0.037$  (3) $\text{\AA}$  and  $\phi=43.3$  (8) $^\circ$  for the pyrazoline ring,  $q_2=0.008$  (3) $\text{\AA}$  and  $\phi=156.3$  (2) $^\circ$  for the substituted cyclopentadienyl (Cp) ring and  $q_2=0.004$  (3) $\text{\AA}$  and  $\phi=69.6$  (5) $^\circ$  for the unsubstituted Cp ring. The dihedral angle of 8.17 (2) $^\circ$  between the pyrazoline ring and the substituted Cp ring indicates that they are conjugated with each other; this is in accord with the C9—C12 bond [1.456 (4)  $\text{\AA}$ ], showing a double-bond character (Shi *et al.*, 2006a). Furthermore, N3—C9 bond length [1.284 (3)  $\text{\AA}$ ] increases as a result of this conjugation. This observation is in good agreement with those reported for 2,6-bis(3-ferrocenyl-5-methyl-1*H*-pyrazol-1-ylcarbonyl)pyridine (Shi *et al.*, 2006b) and 1,3-bis(3-ferrocenyl-5-methyl-1*H*-pyrazol-1-ylcarbonyl)benzene (Shi *et al.*, 2006).

The Fe— $C_{\text{gs}}$  and Fe— $C_{\text{gas}}$  distances are 1.6398 (14) and 1.6544 (14)  $\text{\AA}$ , respectively, and the  $C_{\text{gs}}\text{—Fe—}C_{\text{gas}}$  angle is 177.78 (7) $^\circ$ , where  $C_{\text{gs}}$  and  $C_{\text{gas}}$  are the centroids of the substituted and unsubstituted Cp rings. The small dihedral angle of 3.68 (2) $^\circ$  between the unsubstituted and substituted Cp rings indicates that the two Cp rings are parallel to each other (Shi *et al.*, 2006a). The C12— $C_{\text{gs}}$ — $C_{\text{gas}}$ —C20 torsion angle of 3.71 (2) $^\circ$  indicates that the two Cp rings of the ferrocenyl group is nearly in an eclipsed conformation, as was previously observed in a ferrocene-containing compound (Zora *et al.*, 2008). The C—C bond distances in the Cp rings range from 1.389 (4) to 1.434 (4)  $\text{\AA}$ , while Fe—C bond lengths range between 2.016 (3) and 2.051 (3) $\text{\AA}$  (Table 1), all of which are as expected (Zora *et al.*, 2006).

The pyrazoline ring and the nitro substituted phenyl group make a dihedral angle of 70.76 (1) $^\circ$ . The dihedral angle between the nitro plane and phenyl ring is 18.30 (5) $^\circ$ . The dihedral angles between the phenyl ring and the substituted and unsubstituted Cp planes are 76.16 (1) and 76.12 (1) $^\circ$ , respectively. The molecules in crystal are held together by three intermolecular C—H···O hydrogen bonds (Table 2; Fig. 2). There is one intramolecular C—H···N hydrogen bond.

## Experimental

A mixture of 1-ferrocenyl-3-(2-nitrophenyl)-2-propenone (0.09 g, 0.24 mmol), 80% hydrazine hydrate (0.264 g, 5.28 mmol) and glacial acetic acid (10 ml) was refluxed under nitrogen atmosphere for 5 h. TLC indicated the formation of the reaction product. It was poured into ice-water to give dark orange solid. The participate was separated by filtration and washed with water. The solid product was dried at room temperature. Single crystals of the title compound suitable for X-ray measurements were obtained by recrystallization from methanol at room temperature (yield 50.5%; m.p. 425–426 K). IR (KBr,  $\text{cm}^{-1}$ ): 1653 (C=O), 1601 (C=C), 1574 (C=N), 1527 (*asym* N=O), 1333 (*sym* N=O), 1107 (C—N).  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ , p.p.m.): 2.33 (s, 1H,  $\text{CH}_3$ ), 2.89 (dd, 1H, pyrazoline H<sub>4</sub>), 3.84 (dd, 1H, pyrazoline H<sub>4</sub>), 4.04 (s, 5H, ferrocene), 4.36 (s, 2H, ferrocene), 4.53 (s, 1H, ferrocene), 4.60 (s, 1H, ferrocene), 6.03 (dd, 1H, pyrazoline H<sub>5</sub>), 7.23–8.05 (m, 4H, aromatic).  $^{13}\text{C-NMR}$  ( $\text{CDCl}_3$ , p.p.m.): 21.75 ( $\text{CH}_3$ ), 43.83 (C4), 56.52 (C5), 67.30, 67.78 (C2', C5'), 69.46 (C6–C10'), 70.61, 71.10 (C3', C4'), 74.86 (C1'), 125.56 (C8), 126.37 (C9), 128.50 (C11), 134.28 (C10), 137.33 (C6), 147.08 (C7), 156.63 (C3), 168.30 (C=O).

## Refinement

H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (aromatic), 0.98 (CH) and 0.97 Å (CH<sub>2</sub>) and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . H atoms of the methyl group (C11) show rotational disorder from a difference Fourier map. These H atoms were refined as riding atoms, with C—H = 0.96 Å and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ .

## Figures

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
