Received 10 October 2011; accepted 28 October 2011

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.056;  $wR$  factor = 0.139; data-to-parameter ratio = 26.7.

In the title compound,  $[\text{Cr}(\text{C}_{18}\text{H}_{12}\text{F}_3\text{P})_2(\text{CO})_4]$ , the Cr atom is octahedrally coordinated by four carbonyl ligands and the two tertiary phosphanes, which are *trans* to each other. The three benzene rings in one phosphane ligand make dihedral angles of 53.50 (9), 75.51 (10) and 80.63 (10) $^\circ$  with each other, while in the other ligand these angles are 51.92 (10), 78.56 (11) and 86.80 (10) $^\circ$ . C–H $\cdots$ O and C–H $\cdots$ F interactions link the molecules into a three-dimensional network. Each of the F atoms is disordered over two positions with refined occupancies of 0.944 (3):0.056 (3), 0.702 (4):0.298 (4), 0.829 (4):0.171 (4), 0.567 (4):0.433 (4), 0.545 (4):0.455 (4) and 0.920 (4):0.080 (4).

### ***trans*-Tetracarbonylbis[tris(3-fluorophenyl)phosphane]chromium(0)**

**M. N. Norlidah, M. Y. Yazid, O. bin Shawkataly, M. M. Rosli and H.-K. Fun**

#### **Comment**

The bonding characteristics of metal carbonyls with a phosphine ligand in phosphine-substituted metal carbonyls are of interest. Several crystal structures of phosphine-substituted group 6 carbonyls with *trans* coordination of phosphine have been reported (Brunet *et al.*, 2002; Bennett *et al.*, 2004).

In the title compound where the fluorine atom is in the *meta* position on each benzene ring (Fig. 1), the Cr—P bond lengths, with an average value of 2.3327 Å (Table 1), are relatively short despite the presence of the bulky phosphine ligand, compared to the average value of 2.3656 (16) Å in the complex *trans*-Cr(CO)<sub>4</sub>(PPh<sub>3</sub>)<sub>2</sub> (Bennett *et al.*, 2004). We have previously reported the C<sub>40</sub>H<sub>24</sub>CrF<sub>6</sub>O<sub>4</sub>P<sub>2</sub> but the fluorine atom is in the *para* position whereby the average of Cr—P bond lengths is almost similar (Norlidah *et al.*, 2011).

All six fluorine atoms in the title compound are disordered over two positions with the final refined occupancies being 0.944 (3):0.056 (3) (F1:F1X), 0.702 (4):0.298 (4) (F2:F2X), 0.829 (4):0.171 (4) (F3:F3X), 0.567 (4):0.433 (4) (F4:F4X), 0.545 (4):0.455 (4) (F5:F5X) and 0.920 (4):0.080 (4) (F6:F6X) (Fig. 1). The dihedral angles of the three benzene rings attached to the P1 atom are 53.50 (9)° (between C1—C6 & C7—C12), 80.63 (10)° (between C1—C6 & C13—C18) and 75.51 (10)° (between C7—C12 & C13—C18) and the dihedral angles of the three benzene ring attached to the P2 atom are 86.80 (10)° (between C19—C24 & C25—C30), 78.56 (11)° (between C19—C24 & C31—C36) and 51.92 (10)° (between C25—C30 & C31—C36).

C4—H4A···F1<sup>ii</sup> interaction showing a R<sub>2</sub><sup>2</sup>(8) hydrogen ring motif and other intermolecular interactions C2—H2A···O2<sup>i</sup>, C10—C10A···F4<sup>iii</sup>, C28—H28A···F5<sup>iv</sup> and C34—H34A···F3<sup>v</sup> (Table 2) linked the molecules to form an infinite three-dimensional network (Fig. 2).

#### **Experimental**

All manipulations were performed under a dry, oxygen-free nitrogen atmosphere using standard Schlenk techniques. All solvents were dried over sodium under dry oxygen-free nitrogen. Chromium hexacarbonyl (200 mg, 0.909 mmol) and tris-(3-fluorophenyl)-phosphine (301.8 mg, 0.9542 mmol) in 30 ml of pet ether (100–130 °C) was refluxed for 12 h. Suitable single crystals were obtained by solvent-solvent diffusion in a mixture of dichloromethane/methanol.

#### **Refinement**

All six fluorine atoms are disordered over two position with the final refined occupancies being 0.944 (3):0.056 (3) (F1:F1X), 0.702 (4):0.298 (4) (F2:F2X), 0.829 (4):0.171 (4) (F3:F3X), 0.567 (4):0.433 (4) (F4:F4X), 0.545 (4):0.455 (4) (F5:F5X) and 0.920 (4):0.080 (4) (F6:F6X). C5—F1X, C11—F2X, C23—F4X and C35—F6X distances were restrained to be around

## supplementary materials

---

1.399 (1) Å. F1X and F6X were refined isotropically due to the very small occupancies. All hydrogen atoms were positioned geometrically and refined using a riding model with C—H = 0.95 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

### Figures

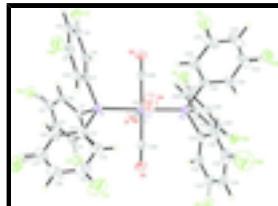

Fig. 1. The molecular structure of the title compound, showing 50% probability displacement ellipsoids. Hydrogen atoms are shown as spheres of arbitrary radius.

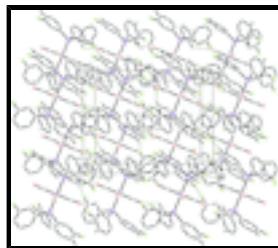

Fig. 2. The packing diagram of the title compound. Dashed lines indicate hydrogen bonds. H atoms not involved in the hydrogen bond interactions have been omitted for clarity.

	$l = -24 \rightarrow 22$

## *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.056$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.139$	H-atom parameters constrained
$S = 1.21$	$w = 1/[\sigma^2(F_o^2) + (0.041P)^2 + 2.0091P]$ where $P = (F_o^2 + 2F_c^2)/3$
14097 reflections	$(\Delta/\sigma)_{\max} < 0.001$
528 parameters	$\Delta\rho_{\max} = 1.19 \text{ e } \text{\AA}^{-3}$
4 restraints	$\Delta\rho_{\min} = -1.41 \text{ e } \text{\AA}^{-3}$

## *Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
