Received 13 December 2007; accepted 2 January 2008

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.041; wR factor = 0.097; data-to-parameter ratio = 21.7.

The asymmetric unit of the title compound, $\{[\text{Cu}(\text{C}_4\text{H}_2\text{O}_4)(\text{C}_3\text{H}_{10}\text{N}_2)(\text{H}_2\text{O})]\cdot\text{H}_2\text{O}\}_n$, consists of two Cu^{II} atoms, half each of two propane-1,3-diamine ligands and two coordinated water molecules, all lying on crystallographic mirror planes, also one fumarate dianion and one uncoordinated water molecule in a general position. The $\text{Cu}(\text{C}_3\text{H}_{10}\text{N}_2)(\text{H}_2\text{O})$ units are linked *via* fumarate dianions into a zigzag chain running along the a axis. A longer $\text{Cu}-\text{O}$ distance [2.873 (3) Å] is to a water molecule bridging equivalent Cu^{II} atoms in adjacent chains, forming a three-dimensional framework. One of the Cu^{II} atoms is in a distorted square-pyramidal environment and the other is in a pseudo-octahedral geometry of the [5+1] type. $\text{O}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds are observed in the crystal structure.

Comment

Metallo-polymers are of current interest because of their physical properties and applications in many areas (Chan, 2007; Rudkevich, 2007; Shi *et al.*, 2007; Mori *et al.*, 2005). The synthesis and crystal structure of copper-polycarboxylate polymers have been reported (Mukherjee *et al.*, 2004; Ye *et al.*, 2005). Now we report here the crystal structure of the title compound.

The asymmetric unit of the title compound consists of two Cu^{II} atoms, one half each of two 1,3-diaminopropane ligands and two water molecules, all lying on crystallographic mirror planes, and one fumarate dianion. As shown in Fig.1, the [(aqua)(propane-1,3-diamino- κ^2 -N,N)copper(II)] units are linked *via* amphi-monodentate fumarate dianions into a zigzag chain along the *a* axis. Each Cu^{II} atom has a distorted square-pyramidal environment, being coordinated by two N atoms of the 1,3-diaminopropane ligand and two *cis*-oxygen atoms from two bridging fumarate dianions in the basal positions and a water molecule in the apical position. The axial Cu—O bond distance [2.180 (3) Å] is shorter, and the Cu···Cu distance [9.084 Å] is longer than the corresponding distances [2.481 Å and 8.857 Å] reported for fumarate bridged [(aqua)(1,2-dimethylethane-1,2-diamine- κ^2 -N,N)copper(II)] (Mukherjee *et al.*, 2004). The six-membered metallocyclic ring formed by the N,N-bidentate propane-1,3-diamine ligand and the Cu^{II} atom adopts a chair conformation.

In the crystal structure, the longer Cu2—O3'(-*x*, -*y*, -1/2 + *z*) coordination [2.873 (3) Å] involving the water molecule bridges Cu^{II} atoms of adjacent zigzag chains, leading to the formation of a three-dimensional framework. The coordination of the Cu2 atom in the network is pseudo-octahedral of the [5 + 1] type. The structure is further stabilized by O—H···O and N—H···O hydrogen bonds (Table 2). The geometry of hydrogen bonds are similar to those reported for a variety of copper compounds (Zheng & Xie, 2004; Dong *et al.*, 2006).

Due to their convenient synthesis and potential catalytic and sorption applications, studies are in progress in our laboratories to synthesize several other polycarboxylate metallopolymers which are structurally and electronically tuned by polyamines.

Experimental

Fumaric acid (0.12 g, 1.0 mmol) was added to an aqueous suspension of CuCO₃.Cu(OH)₂.H₂O (0.12 g, 0.50 mmol), and then propane-1,3-diamine (0.08 ml, 1.0 mmol) was added dropwise, with stirring and heating. The mixture was allowed to react for 2 h and filtered, and the filtrate was allowed to stand at room temperature for 4 d. At the end of this time, deep blue colourless crystals deposited, which were filtered off and dried in air.

Refinement

The water H atoms were located from a difference Fourier map and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. The remaining H atoms were placed in idealized positions and constrained to ride on their parent atoms, with $\text{N}-\text{H} = 0.90 \text{ \AA}$, $\text{C}-\text{H} = 0.93$ or 0.97 \AA and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$.

Figures

Fig. 1. The coordination environment of the Cu^{II} center, showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms have been omitted for clarity. [symmetry code: $-x + 1, y, z$.]

Fig. 2. Part of a zigzag polymeric chain of the title compound. Hydrogen bonds are shown as dashed lines.

1 restraint	$\Delta\rho_{\min} = -0.82 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 1415 Friedel pairs
	Flack parameter: 0.011 (18)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
