Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.035; wR factor = 0.086; data-to-parameter ratio = 15.7.

The title monohydrate, $\text{C}_9\text{H}_{10}\text{N}_2\text{O}_3\cdot\text{H}_2\text{O}$, contains an aziridine ring including two contiguous stereocenters, both of which exhibit an *R* configuration. The methylhydroxy and nitrophenyl groups are *cis*-disposed about the aziridine ring. The mean plane of the benzene ring is tilted to the aziridine ring by $66.65(8)^\circ$. The nitro group is nearly coplanar with the benzene ring [dihedral angle = $2.5(2)^\circ$]. In the crystal, the components are linked by $\text{N}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{N}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, generating supramolecular layers parallel to (001).

[(2*R*,3*R*)-3-(4-Nitrophenyl)aziridin-2-yl]methanol monohydrate

V. Gaumet, C. Denis, F. Leal, M. Madesclaire and V.P. Zaitsev

Comment

Because of their powerful alkylating properties (Li *et al.*, 1995), aziridine-containing natural products such as mitomycin C, dibenzyl aziridine-2,3-dicarboxylate, *N*-(diethylphosphonopropionyl)-2-hydroxymethylaziridine, aziridinylbenzoquinones are potent antitumor and antibiotic agents (Sheldon *et al.*, 1999; Danshiitsoodol *et al.*, 2006; Vicik *et al.*, 2006; Keniche *et al.*, 2011; Lee *et al.*, 1992; Ngo *et al.*, 1998). Furthermore chiral aziridine derivatives offer a combination of reactivity, synthetic flexibility, and atom economy that is commonly employed in heterocyclic chemistry for the preparation of important pharmaceutical products like effective antiretroviral drugs used in the treatment of the human immunodeficiency virus (Kim *et al.*, 2001).

Dimensions of aziridine cycles highlight a pronounced C—C bond shortening [1.487 (2) Å] and a little C—N bond lengthening [1.478 (2) Å on average] when compared to normal open chain C—C (1.54 Å) and C—N (1.46 Å) bond lengths. Aziridine endocyclic angles are close to 60° [59.7 (1) - 60.4 (1)°] and the geometry at nitrogen is pyramidal (Zhu *et al.*, 2006). Methyl hydroxyl and nitrophenyl groups are *cis*-disposed about the aziridine ring (Fig. 1) and only one invertomer was found that has the NH proton on the least hindered ring side. The nitro group is nearly coplanar with the benzene ring [C8—C9—N12—O13 = 2.5 (2)°]. The mean N—O bond lengths are in an usual range [1.216 (2) - 1.223 (2) Å] for aromatic nitro groups.

$C_9H_{10}N_2O_3$ molecules are linked into infinite chains *via* N1—H1···O5 intermolecular hydrogen bonds (Table 1). Along these chains, the nitro phenyl groups are located on the same side in an isotactic way (Fig. 2). Accordingly, the chain structure is additionally stabilized by an intermolecular $NO_2\cdots\pi$ interaction, namely N12—O14··· C_g^{iv} [symmetry code: *iv*: $x, y + 1, z$], with distance of 3.539 (1) Å between O14 atom and centroid, C_g , of (C6—C11) aromatic ring. Chains are running parallel to the [0 1 0] direction and define hydrophilic channels occupied by water molecules. The water oxygen atom O1w acts as both donor and acceptor in four hydrogen bonds. The dihedral angle between the acceptor plane (defined by O1w^v, O1w and O5^{vii}) and the donor plane (defined by O1wⁱⁱⁱ, O1w and N1) is 86.67 (4)°. O1w^v lies 0.216 (6) Å below the donor plane (Fig. 3). The hydrogen bonds lie in the lone-pair plane of the O1w atom but no preference could be discerned for the sp^3 (*i.e.* tetrahedral) lone pair directions within that plane. The strong H-bond network between chains and water molecules builds up $[(C_9H_{10}N_2O_3)_2(H_2O)_2]_\infty$ layers parallel to the (0 0 1) plane (Fig. 2).

Experimental

(2*R*,3*R*)-3-(4-Nitrophenyl)aziridin-2-ylmethanol was synthesized from (1*S*,2*S*)-2-amino-1-(4-nitrophenyl)-1,3-propandiol by the four-step method developed by Madesclaire *et al.* (2013). Plate and colourless crystals of the title compound were obtained by slow evaporation in air of a 1:10 (*v/v*) methanol-ethyl acetate solution. The formation of the monohydrated compound is certainly favored by the high hygroscopicity of methanol which absorbs moisture from the air. Once formed, monocrystals are stable in air for several weeks.

Refinement

All C-bound H atoms were positioned geometrically [C—H = 0.97 Å for methanediyl, C—H = 0.98 Å for methanetriyl and C—H = 0.93 Å for aromatic H atoms] and included in the refinement in the riding-model approximation with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. The N- and O-bound H atoms were located from difference-Fourier maps and refined freely. O—H distances in water molecule were restrained to be equal with standard deviation 0.02, the actual value of these distances was free to refine. The absolute structure was set by reference to the known chirality of the carbon atom bearing the hydroxymethyl group, namely C2 (note that the Cahn-Ingold-Prelog designation at C2 atom is reversed by comparison with that of the starting material due to the change in priority of the substituents). Hooft parameter is poorly defined 0.1 (6), however examination of the Bijvoet pairs using the likelihood methods (Hooft *et al.*, 2008) confirms that the absolute configuration had been correctly assigned with probability higher than 0.816.

Computing details

Data collection: *APEX2* (Bruker, 2012); cell refinement: *SAINT* (Bruker, 2012); data reduction: *SAINT* (Bruker, 2012); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEP-3 for Windows* (Farrugia, 2012) and *PLATON* (Spek, 2009); software used to prepare material for publication: *publCIF* (Westrip, 2010).

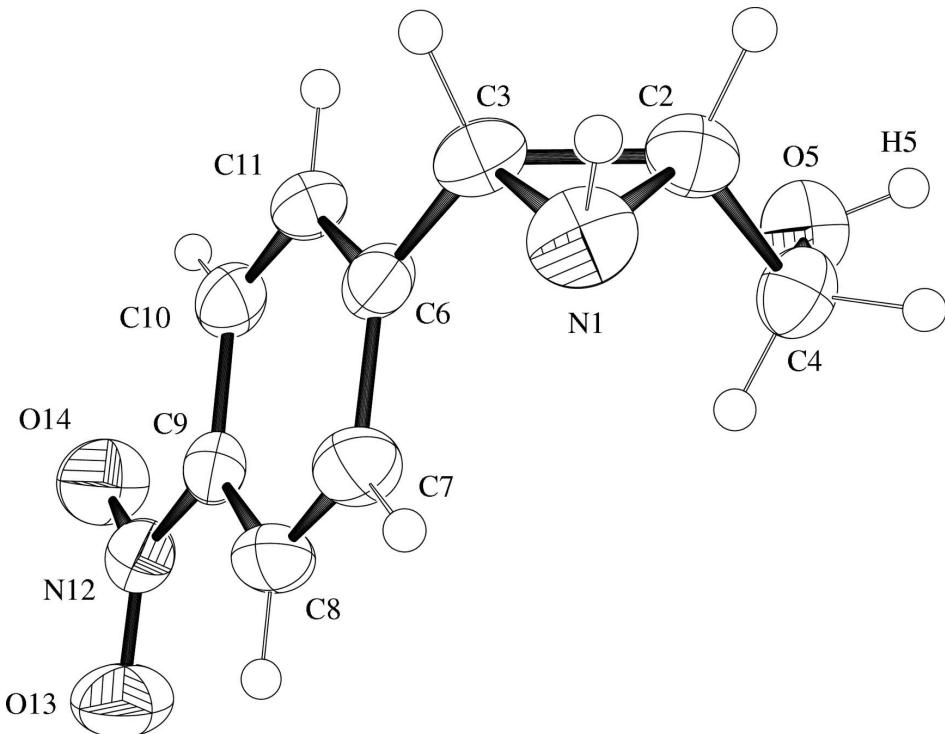

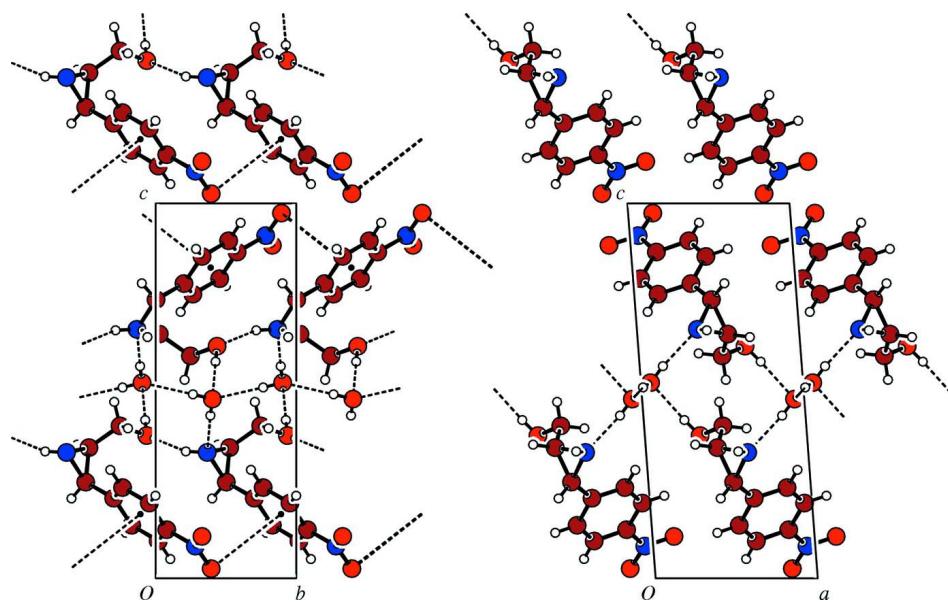

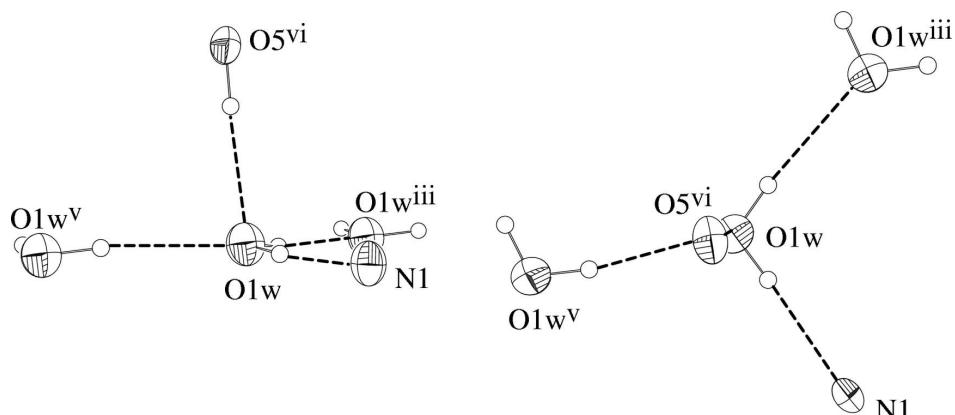

Figure 1

Molecular structure showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented by spheres of arbitrary radius.

**Figure 2**

Structure projections for the title compound. Dashed lines represent intermolecular H-bond and nitro-group $\cdots\pi$ interactions. Left: projection along *a*, the centroids C_g are denoted by small black spheres. Right: projection along *b*, intra-chain interactions have been omitted for clarity.

**Figure 3**

Two orthogonal views of hydrogen bonding around water oxygen atom $O1w$. Thermal ellipsoids are drawn at the 50% probability level. [Symmetry codes: (iii) $-x + 2, y - 1/2, -z + 1$; (v) $-x + 2, y + 1/2, -z + 1$; (vi) $-x + 1, y - 1/2, -z + 1$]

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.035$
 $wR(F^2) = 0.086$
 $S = 1.04$
 2383 reflections
 152 parameters
 2 restraints
 Primary atom site location: structure-invariant direct methods
 Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites
 H atoms treated by a mixture of independent and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.0435P)^2 + 0.0307P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.13 \text{ e \AA}^{-3}$
 $\Delta\rho_{\min} = -0.19 \text{ e \AA}^{-3}$
 Absolute structure: The absolute configuration was assigned to agree with that of its precursor at the chiral center C2.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
