In the cation of the title salt,  $C_9H_{12}N_3S^+\cdot Br^-$ , the thiazolidine ring adopts an envelope conformation with the C atom adjacent to the phenyl ring as the flap. In the crystal, N—H···Br hydrogen bonds link the components into a three-dimensional network. Weak  $\pi$ – $\pi$  stacking interactions between the phenyl rings of adjacent cations also contribute to the molecular packing. A Hirshfeld surface analysis was conducted to quantify the contributions of the different intermolecular interactions and contacts.

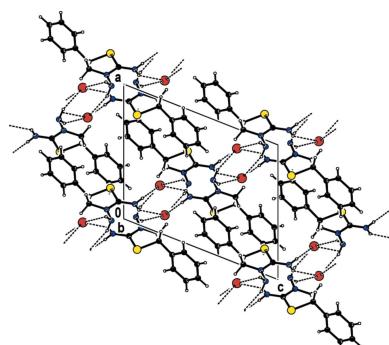

## 1. Chemical context

As well as their synthetic utility, thiazolidine derivatives possess a broad spectrum of biological activities such as antimalarial, antibacterial, antimicrobial, anti-inflammatory, anticancer, etc. The biological activities of compounds containing a thiazolidine core, such as 1,3-thiazolidines, 2,4-dione-, 4-oxo-thiazolidine, etc. were summarized in a recent review (Makwana & Malani, 2017). On the other hand, as hydrazones these N-containing ligands have been widely used in the synthesis of coordination compounds (Gurbanov *et al.*, 2018*a,b*). The non-covalent donor or acceptor properties of N-containing ligands can also contribute to their catalytic activity, among other properties (Mahmudov *et al.*, 2019; Zubkov *et al.*, 2018). As part of our ongoing work in this area, we now describe the synthesis and structure of the title molecular salt,  $C_9H_{12}N_3S^+\cdot Br^-$ , (I).

## 2. Structural commentary

In the cation of (I) (Fig. 1), the thiazolidine ring (S1/N1/C1–C3) adopts an envelope conformation with puckering parameters of  $Q(2) = 0.317 (2)$  Å and  $\varphi(2) = 225.2 (4)^\circ$ : the flap atom is C1. In the arbitrarily chosen asymmetric unit, C1 has an *R* configuration, but symmetry generates a racemic mixture

in the crystal. The dihedral angle between the mean plane of the thiazolidine ring (all atoms) and the phenyl ring (C4–C9) is  $89.27$  (13) $^\circ$ .

### 3. Supramolecular features and Hirshfeld surface analysis

In the crystal, each cation forms N—H $\cdots$ Br hydrogen bonds (Table 1) as well as aromatic  $\pi$ – $\pi$  stacking interactions between the phenyl rings of adjacent cations [ $Cg2\cdots Cg2^{\text{iv}} = 3.7758$  (16)  $\text{\AA}$ ; symmetry code: (iv)  $1-x, 1-y, 2-z$ ; where  $Cg2$  is the centroid of the phenyl ring of the cation]: chains of cations form along the [101] direction (Fig. 2). Taking into account the hydrogen bonding and  $\pi$ – $\pi$  stacking, the overall connectivity is three-dimensional.

Hirshfeld surface analysis (Spackman & Jayatilaka, 2009; Spackman & McKinnon, 2002) was carried out with *Crystal-Explorer3.1* (Wolff *et al.*, 2012) to further investigate the presence of hydrogen bonds and intermolecular interactions in the crystal structure (see supporting information). Fig. 3(a) shows the two-dimensional fingerprint of the sum of the contacts contributing to the Hirshfeld surface represented in normal mode while those delineated into H $\cdots$ H (41.5%), Br $\cdots$ N/N $\cdots$ Br (24.1%), C $\cdots$ H/H $\cdots$ C (13.8%) and S $\cdots$ H/H $\cdots$ S (11.7%) contacts, respectively, are shown in Fig. 3b–e. All contacts are listed in Table 2.

**Figure 1**

The molecular structure of the title salt. Displacement ellipsoids are drawn at the 50% probability level and the H $\cdots$ Br hydrogen bond is indicated by a dashed line.

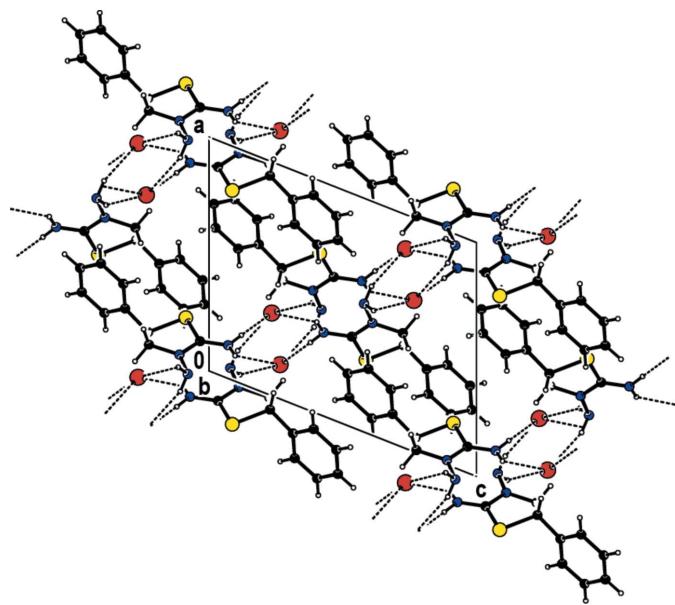

**Table 2**  
Percentage contributions of interatomic contacts to the Hirshfeld surface for the title salt.

Contact	Percentage contribution
H $\cdots$ H	41.5
Br $\cdots$ N/N $\cdots$ Br	24.1
C $\cdots$ H/H $\cdots$ C	13.8
S $\cdots$ H/H $\cdots$ S	11.7
N $\cdots$ H/H $\cdots$ N	3.6
C $\cdots$ C	3.3
N $\cdots$ C/C $\cdots$ N	1.5
N $\cdots$ N	0.3
S $\cdots$ C/C $\cdots$ S	0.3

### 4. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.40, February 2019; Groom *et al.*, 2016) for 2-thiazolidiniminium compounds gave eight hits, *viz.* BOBWIB (Khalilov *et al.*, 2019), UDELUN (Akkurt *et al.*, 2018), WILBIC (Marthi *et al.*, 1994), WILBOI (Marthi *et al.*, 1994), WILBOI01 (Marthi *et al.*, 1994), YITCEJ (Martem'yanova *et al.*, 1993a), YITCAF (Martem'yanova *et al.*, 1993b) and YOPLUK (Marthi *et al.*, 1995).

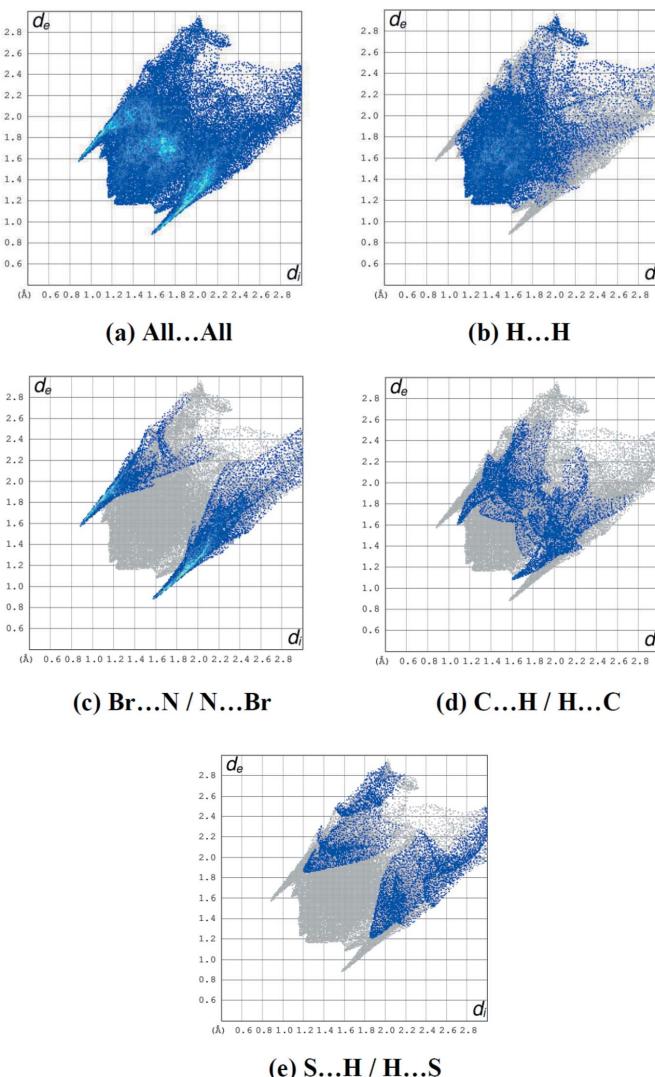

In the crystal of BOBWIB (Khalilov *et al.*, 2019), the thiazolidine ring adopts an envelope conformation. In the crystal, centrosymmetrically related cations and anions are linked into dimeric units *via* N—H $\cdots$ Br hydrogen bonds, which are further connected by weak C—H $\cdots$ Br hydrogen bonds into chains parallel to [110]. In the crystal of UDELUN (Akkurt *et al.*, 2018), C—H $\cdots$ Br and N—H $\cdots$ Br hydrogen bonds link the components into a three-dimensional network with the cations and anions stacked along the *b*-axis direction. Weak C—H $\cdots$  $\pi$  interactions, which only involve the minor disorder component of the ring, also contribute to the molecular packing. In

**Figure 2**

Part of the crystal structure of the title compound, showing the formation of N—H $\cdots$ Br hydrogen bonds in the *ac* plane.

addition, there are also inversion-related  $\text{Cl}\cdots\text{Cl}$  halogen bonds and  $\text{C}-\text{Cl}\cdots\pi(\text{ring})$  contacts. In the other structures, the 3-N atom carries a C substituent: the first three crystal structures were determined for racemic (WILBIC; Marthi *et al.*, 1994) and two optically active samples (WILBOI and WILBOI01; Marthi *et al.*, 1994) of 3-(2'-chloro-2'-phenylethyl)-2-thiazolidiniminium *p*-toluenesulfonate. In all three structures, the most disordered fragment of these molecules is the asymmetric C atom and the Cl atom attached to it. The disorder of the cation in the racemate corresponds to the presence of both enantiomers at each site in the ratio 0.821 (3):0.179 (3). The system of hydrogen bonds connecting two cations and two anions into 12-membered rings is identical in the racemic and in the optically active crystals. YITCEJ (Martem'yanova *et al.*, 1993a) is a product of the interaction of 2-amino-5-methylthiazoline with methyl iodide, with alkylatation at the endocyclic nitrogen atom, while YITCAF

(Martem'yanova *et al.*, 1993b) is a product of the reaction of 3-nitro-5-methoxy-, 3-nitro-5-chloro-, and 3-bromo-5-nitrosalicylaldehyde with the heterocyclic base to form the salt-like complexes.

## 5. Synthesis and crystallization

To a solution of 2.2 mmol (0.6 g) (1,2-dibromoethyl)benzene in 20 ml of ethanol were added 2.3 mmol (0.3 g) of thiosemicarbazide hydrochloride; 3–4 drops of piperidine were added and the mixture was refluxed for 7 h. The reaction mixture was cooled to room temperature and the solid product was precipitated from solution, collected by filtration and recrystallized from ethanol solution to give colourless crystals of (I) with a yield of 88%, m.p. = 468 K. Analysis calculated for  $\text{C}_9\text{H}_{12}\text{BrN}_3\text{S}$ : C 39.43; H 4.41; N 15.33. Found: C 39.40; H 4.39; N 15.30%. <sup>1</sup>H NMR (300 MHz, DMSO-*d*<sub>6</sub>): 4.16 (*q*, 1H,  $\text{CH}_2$ , <sup>3</sup>*J*<sub>H-H</sub> = 5.4); 4.45 (*t*, 1H,  $\text{CH}_2$ , <sup>3</sup>*J*<sub>H-H</sub> = 8.4); 5.25 (*t*, 1H,  $\text{CH-Ar}$ , <sup>3</sup>*J*<sub>H-H</sub> = 5.4); 7.32–7.50 (*m*, 5H, 5Ar-H); 9.12 (*s*, 2H, NH<sub>2</sub>); 9.78 (*s*, 1H, NH=). <sup>13</sup>C NMR (75 MHz, DMSO-*d*<sub>6</sub>): 44.42, 62.06, 127.59, 128.76, 129.17, 138.85, 168.53. MS (ESI), *m/z*: 194.28 [ $\text{C}_9\text{H}_{12}\text{N}_3\text{S}^+$ ] and 79.88 Br<sup>-</sup>.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. All H atoms on C atoms were placed at calculated positions (C–H = 0.95–1.00 Å) and

refined using a riding model. The N-bound hydrogen atoms were located from difference-Fourier maps and relocated to idealized locations ( $N-H = 0.90 \text{ \AA}$ ) and refined as riding atoms. The constraint  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{carrier})$  was applied in all cases. One outlier ( $\bar{1}01$ ) was omitted in the final cycles of refinement.

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
