Received 9 August 2011; accepted 17 August 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.017\text{ \AA}$; H-atom completeness 96%; R factor = 0.037; wR factor = 0.082; data-to-parameter ratio = 22.5.

In the title complex, $[\text{Co}(\text{C}_{12}\text{H}_8\text{N}_2)_3][\text{CoI}(\text{C}_{12}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})]\cdot[\text{Bi}_3\text{I}_{12}]$, conventionally abbreviated $[\text{Co}(\text{phen})_3][\text{CoI}(\text{phen})_2(\text{H}_2\text{O})]\cdot[\text{Bi}_3\text{I}_{12}]$, where phen is 1,10-phenanthroline, the Co^{II} atom in one cation is coordinated by six N atoms from three phen ligands in an octahedral coordination while the Co^{II} atom in the other cation is coordinated octahedrally by four N atoms from two phen ligands, one water O atom and one I atom. In the anion, three Bi^{III} ions adopt an octahedral coordination constructed by six I^- ligands. The three BiI_6 octahedra are fused together through *trans* face-sharing.

A double salt of iodobismuthate: *cis*-aquaiodidobis(1,10-phenanthroline)cobalt(II) tris(1,10-phenanthroline)cobalt(II) *trans*-hexa- μ_2 -iodido-hexaiodidotribismuthate(III)

J. Chen, W. Chai, L. Song, Y. Yang and F. Niu

Comment

Alkylammonium halogenoantimonates(III) and bismuthates(III) of general formula $R_aM_bX_{3-b+a}$ (where R denotes organic cations, M—Sb(III), Bi(III), and X —Cl, Br, I) form a large group of crystals exhibiting interesting physical properties from their noncentrosymmetric space groups, *e.g.*, ferroelectricity (Jozkow *et al.*, 2001). Of them, $R_3M_2X_9$ and $R_5M_2X_{11}$ have been studied in detail for their phase transitions and physical properties. $[Bi_3I_{12}]^{3-}$ is potentially chiral, but there is only one such example containing *cis*- $[Bi_3I_{12}]^{3-}$ reported (Sharutin *et al.* 2009). In searching for other crystals in a non-centrosymmetric space group of halogenobismuthate(III), we employed a potentially optically active complex cation, *e.g.*, $[Co(phen)_3]^{2+}$ to synthesize a non-centrosymmetric compound. Here, we report one of those iodobismuthate(III) complexes, $[Co(phen)_3][CoI(phen)_2(H_2O)][Bi_3I_{12}]$, composed of the trinuclear Bi(III) cluster anion of *trans*- $[Bi_3I_{12}]^{3-}$, and the cations containing cobalt(II) in a noncentrosymmetric space group.

In the title compound, three Bi atoms are all located in an octahedral environment of six I atoms, and three BiI_6 octahedra are fused together to form a *trans*- $[Bi_3I_{12}]^{3-}$ trinuclear cluster by *trans* face-sharing through two pairs of three μ_2 -I atoms. In three BiI_6 octahedra, the bond lengths of Bi—I ranged from 2.853 (1) Å to 3.419 (1) Å. All bond lengths are within commonly accepted values in the literature (Sharutin *et al.* 2009; Geiser *et al.*, 1990; Carmalt *et al.*, 1995; Okrut *et al.*, 2006). In the two cations of the title compound, one cobalt(II) is located in an octahedral environment constructed by six N atoms from three phen ligands to form a $[Co(phen)_3]^{2+}$ cation, and the other cobalt(II) is located in a distorted octahedral environment constructed by four N atoms from two phen ligands, one O atom from water and one I atom to form a cis - $[CoI(phen)_2(H_2O)]^+$ cation. In the cation of $[Co(phen)_3]^{2+}$, the bond lengths of Co—N range from 2.124 (7) Å to 2.142 (8) Å, which are similar reported literature values (Liu *et al.*, 2003; Harding *et al.*, 2008; Tershansky *et al.* 2005; Hanauer *et al.* 2008; Boys *et al.* 1984). In the cation of $[CoI(phen)_2(H_2O)]^+$, $Co1—O1 = 2.154 (8)$ Å, $Co1—I13 = 2.782 (2)$ Å, the bond lengths of Co—N ranged from 2.104 (8) Å to 2.165 (9) Å. This structure is similar to that of the reported $[CoCl(phen)_2(H_2O)]^+$ cation (Arun Kumar *et al.*, 2009; Zhong *et al.*, 2007; Zhong *et al.*, 2006).

Experimental

The title compound was synthesized by a solvothermal reaction of $CoCl_2$ hexahydrate (48 mg, 0.2 mmol), BiI_3 (180 mg, 0.3 mmol), KI (68 mg, 0.4 mmol) and 1,10-phenanthroline monohydrate (100 mg, 0.5 mmol) in 15 ml ethanol. The mixture was heated to 383 K at the rate of 20 K/h, and kept at this temperature for 2 days and then cooled to room temperature at the rate of 2 K/h. The red crystals were obtained in a yield of 47% (156 mg). Anal. Calc. for $C_{60}H_{42}Bi_3Co_2I_{13}N_{10}O$ (%): C, 21.75; H, 1.28; N, 4.23; O, 0.48. Found: C, 21.47; H, 1.46; N, 4.52; O, 0.63. Crystals suitable for single-crystal X-ray diffraction were selected directly from the sample as prepared.

supplementary materials

Refinement

All hydrogen atoms attached to C were added at calculated positions and refined using a riding model (C-H = 0.93 Å). Due to the presence of Bi in the structure, those pertaining to the coordinated water O1 could not be found in the difference Fourier map and were not included in the model.

Figures

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
