

# INTERDISCIPLINARY DOMAIN OF DIGITAL HEALTH

Approaches and perspectives in digital health intervention design

## DESIGN

Various design methodologies such as user-centred, human-centred, patient-centred, patient-led, person-based and other hybrid approaches are employed that encompass different research philosophies, methods and metrics all aimed at incorporating end users.

## DOMAIN

Various perspectives from health care to digital design, app development and engineering play a role in shaping a digital health intervention. This collaboration brings great promise to digital health but also creates domain silos and divergent goals.

## USER

The user of a digital health intervention may be considered an end user, a patient, a person or human. This framing of the user of the intervention is largely premised on the domain and design employed.
