Correspondence e-mail: thkim@chonnam.ac.kr

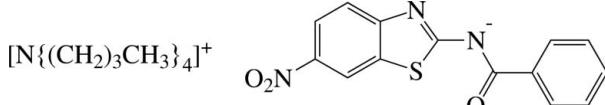

Received 1 June 2010; accepted 5 July 2010

Key indicators: single-crystal X-ray study;  $T = 223\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$ ;  $R$  factor = 0.069;  $wR$  factor = 0.169; data-to-parameter ratio = 16.5.

In the title salt,  $\text{C}_{16}\text{H}_{36}\text{N}^+\cdot\text{C}_{14}\text{H}_8\text{N}_3\text{O}_3\text{S}^-$ , the torsion angles within the cation reveal that one butyl group displays an *anti* conformation and the other three butyl groups show *gauche* conformations. The anion is almost planar, with a largest deviation of  $0.166(6)\text{ \AA}$  from the least-squares plane (r.m.s. deviation of fitted atoms =  $0.052\text{ \AA}$ ). In the crystal structure, the component ions interact by means of weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds.

### Tetrabutylammonium *N*-benzoyl-6-nitro-1,3-benzothiazol-2-aminide

**Q. P. B. Nguyen, S. O. Kang and T. H. Kim**

#### Comment

The development of colorimetric chemosensors is attractive in supramolecular chemistry because they give a direct signal which is easily observed by the naked eye (Coll *et al.*, 2007). Most chemosensors contain –NH fragments which act as hydrogen bond donors for the binding of anions. However, the chromophore fragments for colorimetric signal may contain electron-withdrawing groups that enhance the acidity of the –NH protons of the binding site. Therefore, these acidic protons can be abstracted by the basic anions in the deprotonation process (Evans *et al.*, 2006). In some cases, it is difficult to establish a clear difference between a hydrogen bond donor binding process and a deprotonation process. The title salt was prepared on the study of the nature of interaction between *N*-(6-nitrobenzo[*d*]thiazol-2-yl)benzamide and tetrabutylammonium acetate (Kang *et al.*, 2009).

The asymmetric unit of the title salt,  $C_{16}H_{36}N^+ \cdot C_{14}H_8N_3O_3S^-$ , contains a tetrabutylammonium cation and a deprotonated anion of *N*-(6-nitrobenzo[*d*]thiazol-2-yl)benzamide (Fig. 1). The C15—C16—C17—C18 torsion angle of -179.9 (7) $^\circ$  displays the anti conformation for the four atoms of a butyl group within the cation, whereas the other three butyl groups show the *gauche* conformations with the torsion angles of -74.8 (7) $^\circ$  (C19—C20—C21—C22), -75.7 (8) $^\circ$  (C23—C24—C25—C26) and -65.9 (9) $^\circ$  (C27—C28—C29—C30) $^\circ$ . The anion is almost planar with the largest deviation of 0.166 (6) Å (O2) from the least-squares plane (r.m.s. deviation of fitted atoms: 0.052 Å). In the crystal structure, the component ions interact by means of weak intermolecular C—H $\cdots$ O hydrogen bonds (Table 1 and Fig. 2).

#### Experimental

A solution of 6-nitrobenzo[*d*]thiazol-2-amine (0.300 mg, 1.54 mmol) and benzoyl chloride (0.148 ml, 1.28 mmol) in pyridine was refluxed for 24 h under argon atmosphere. Upon completion of the reaction, the reaction mixture was cooled to 0 °C, and poured into water. The formed precipitate was separated by filtration and washed with methanol, dichloromethane and ether and dried, to give a yellow solid *N*-(6-nitrobenzo[*d*]thiazol-2-yl)benzamide (0.192 g, yield 50%). Crystals of the title compound suitable for X-ray analysis were obtained in a deprotonation reaction that involved slow evaporation of an acetonitrile solution of *N*-(6-nitrobenzo[*d*]thiazol-2-yl)benzamide in the presence of excess tetrabutylammonium acetate at room temperature.

#### Refinement

H atoms were positioned geometrically and allowed to ride on their respective parent atoms [C—H = 0.94 (CH), 0.98 (CH<sub>2</sub>) or 0.97 Å (CH<sub>3</sub>) and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  or  $1.5U_{\text{eq}}$ (methyl C)].

Monoclinic, $Cc$		Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: C -2yc		Cell parameters from 1597 reflections
$a = 7.9234 (7) \text{ \AA}$		$\theta = 2.7\text{--}19.4^\circ$
$b = 25.059 (2) \text{ \AA}$		$\mu = 0.14 \text{ mm}^{-1}$
$c = 15.4916 (14) \text{ \AA}$		$T = 223 \text{ K}$
$\beta = 97.699 (2)^\circ$		Block, yellow
$V = 3048.2 (5) \text{ \AA}^3$		$0.22 \times 0.11 \times 0.10 \text{ mm}$
$Z = 4$		

### Data collection

Bruker SMART 1000 CCD diffractometer	5730 independent reflections
Radiation source: fine-focus sealed tube graphite	2547 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.076$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2000)	$\theta_{\max} = 28.3^\circ$ , $\theta_{\min} = 2.1^\circ$
$T_{\min} = 0.979$ , $T_{\max} = 0.988$	$h = -9 \rightarrow 10$
11371 measured reflections	$k = -33 \rightarrow 29$
	$l = -19 \rightarrow 20$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites

$R[F^2 > 2\sigma(F^2)] = 0.069$	H-atom parameters constrained
$wR(F^2) = 0.169$	$w = 1/[\sigma^2(F_o^2) + (0.0566P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.95$	$(\Delta/\sigma)_{\max} < 0.001$
5730 reflections	$\Delta\rho_{\max} = 0.25 \text{ e } \text{\AA}^{-3}$
347 parameters	$\Delta\rho_{\min} = -0.19 \text{ e } \text{\AA}^{-3}$
2 restraints	Absolute structure: Flack (1983), 1908 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.08 (12)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
