Received 11 July 2011; accepted 15 July 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.034; wR factor = 0.078; data-to-parameter ratio = 18.7.

In the title compound, $\text{C}_{17}\text{H}_{16}\text{BrN}_3\text{O}_2\text{S}$, the two fused rings are twisted by a dihedral angle of $6.61(15)^\circ$. The thiazine ring adopts a sofa conformation. The toluene ring is oriented at dihedral angles of $15.5(2)$ and $20.6(2)^\circ$ with respect to the bromobenzene and thiazine rings, respectively. The benzylidene system is approximately planar [r.m.s. deviation = 0.0388 \AA]. In the crystal, weak intermolecular C–H···O hydrogen bonds connects the molecules into a chain along the b axis.

Related literature

6-Bromo-1-methyl-4-[2-(4-methylbenzylidene)hydrazinylidene]-3H-2λ⁶,1-benzothiazine-2,2-dione

M. Shafiq, I. U. Khan, M. Zia-ur-Rehman, M. N. Arshad and A. M. Asiri

Comment

In the title molecule (Fig. 1), the thiazine ring adopts a sofa conformation which is similar to the conformation of the corresponding ring in a previously reported compound, 1-propyl-1*H*-2,1-benzothiazin-4(*H*)-one 2,2-dioxide (Khan *et al.*, 2010). The aromatic ring (C1—C6) in the title compound is twisted at 15.5 (2)° with respect to the toluene ring (C10—C15). The benzylidene moiety (C9—C16/N1/N2) is also very near to planarity as showing the r. m. s. deviation of 0.0388 Å and is oriented at a dihedral angle 15.02 (12)° with respect to the benzene ring (C1—C6). The fused aromatic (C1—C6) and thiazine (C1/C6/C7/C8/N1/S1) rings are twisted at a dihedral angle 6.61 (15)°. The oxygen atom from SO₂ group is involved in weak C—H···O type hydrogen bonding interaction, which connects the molecules in a zig-zag mode along the *b*-axis.

The crystal structures of several molecules related to the title compound have been reported (Arshad *et al.*, 2009; Shafiq *et al.*, 2009).

Experimental

The synthesis of the title compound has already been reported (Shafiq *et al.*, 2011). It was recrystallized from a solution in dry ethanol.

Refinement

All H-atoms were positioned at idealized geometry with C_{aromatic}—H = 0.93 Å and C_{methyl}—H = 0.96 Å and were refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ for aromatic & $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$ for methyl carbon atoms. The reflection 0 0 1 has been omitted in final refinement. An absolute structure was determined (Flack, 1983) using 1771 Friedel pairs.

Figures

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.034$	H-atom parameters constrained
$wR(F^2) = 0.078$	$w = 1/[\sigma^2(F_{\text{o}}^2) + (0.0256P)^2]$

$S = 0.97$	where $P = (F_o^2 + 2F_c^2)/3$
4119 reflections	$(\Delta/\sigma)_{\max} = 0.018$
220 parameters	$\Delta\rho_{\max} = 0.29 \text{ e } \text{\AA}^{-3}$
1 restraint	$\Delta\rho_{\min} = -0.36 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 1771 Friedel pairs Flack parameter: 0.004 (8)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
