

# Acupuncture against the metabolic risk factors for stroke

## A systematic review of systematic reviews

Ying Xu, PhD<sup>a,b</sup> , Da-yuan Zhong, PhD<sup>a</sup>, Xiao-qian Liao, MM<sup>a</sup>, Xing-ping Wang, MM<sup>c</sup>, Jin-wen Ge, PhD<sup>a,\*</sup>, Wei-hui Xu, MM<sup>b,\*</sup>

### Abstract

**Objective:** This systematic review (SR) of SRs aims aimed to evaluate the current evidence of rehabilitation interventions in stroke patients after acupuncture treatment.

**Methods:** Full-text SRs published in Chinese and English up to December 15, 2021 were searched in PubMed, Embase, Cochrane Library, CNKI, VIP, and Wanfang databases. The PRISMA statement and the assessment of multiple systematic reviews 2 (AMSTAR 2) scale were used to evaluate the quality of the included articles. The Grading of Recommendations, Assessment, Development and Evaluation (GRADE) system was employed to assess the outcome indicators for evidence quality evaluation.

**Results:** A number of 42 publications were identified in this study. According to these articles, 4 metabolic areas were identified: systolic blood pressure, weight loss, glycemic index and cholesterol. The acupuncture is beneficial to improve the systolic blood pressure of patients, and the effect of acupuncture on diastolic blood pressure is better than that of sham acupuncture. The weight loss effect of acupuncture is better than that of lifestyle and western medicine. The improvement effect of acupuncture on body mass index (BMI) is also better than that of sham acupuncture. In the study of glycemic index of stroke patients, acupuncture significantly improved glycosylated hemoglobin and insulin sensitivity index compared with western medicine. In cholesterol-related research, acupuncture can effectively improve the content of triglycerides. However, studies on HDL and LDL show that acupuncture can significantly improve HDL, but has no significant effect on LDL.

**Conclusion:** This review summarizes the available evidence and underpins findings of the acupuncture exhibited the therapeutic role in eliminating metabolic risk factors for stroke, including systolic blood pressure, weight loss, glycemic index and cholesterol. Acupuncture could have positive effects on a specific symptom, and the effects depend not only on intervention type but also on how and when the intervention is provided. And more prioritizing high-quality research in this field in the future is conducive to guiding clinical practice.

**Abbreviations:** AMSTAR-2 = Assessing the Methodological Quality of Systematic Reviews-2, BMI = Body Mass Index, CNKI = China National Knowledge Infrastructure, GRADE = Grading of Recommendations Assessment Development and Evaluation, HDL = high-density lipoprotein, JBI = Joanna Briggs Institute, LDL = Low Density Lipoprotein, VIP = China Science and Technology Journal Database, PICO = participant intervention, comparison and outcome, PRISMA = The preferred reporting items for systematic reviews and meta-analyses, SR = systematic review.

**Keywords:** Acupuncture, AMSTAR-2, GRADE, review, stroke

## 1. Introduction

Stroke is a global burden and affects not just individual but families, caregivers and society. Stroke is one of the major causes of the loss of life years in the world,<sup>[1]</sup> and has become a major problem in the field of global public health. In 2016, 5.5 million<sup>[2]</sup> people

worldwide died from stroke, and many initiatives are now reshaping stroke prevention, care, and rehabilitation in the country. According to the 2016 Global Burden of Disease Study, China had the highest estimated lifetime risk of stroke from age 25 years onwards of up to 39.3%, compared with 22.2% in Western Europe and 22.4% in high-income North America.<sup>[3]</sup>

*Funding statement:* The study was funded by the Scientific Research Project of department of Education of Hunan province in China (19C1438) and Research Fund of Hunan University of Traditional Chinese Medicine (2019XJJJ023).

The authors have no conflicts of interest to disclose.

The datasets generated during and/or analyzed during the current study are available from the corresponding author on reasonable request.; The datasets generated during and/or analyzed during the current study are publicly available.

Modern medicine for stroke prevention and control focuses on multiple risk factors. A recent study in the *Lancet* collated and analyzed risk factors for stroke and showed a high correlation with interventional risk factors such as hypertension, diabetes, and dyslipidemia.<sup>[4]</sup> This is consistent with the consensus of experts on cardiovascular and cerebrovascular diseases in China.<sup>[5]</sup> The consensus of China suggests that controlling the interventionable metabolic risk factors may be more effective in preventing the occurrence and development of stroke. The decline in mortality of cardiovascular diseases in western countries is closely related to the effective control of risk factors,<sup>[6]</sup> which indicates a new feasible approach for the prevention of stroke. More than thousands of years, acupuncture in China has been used as a traditional medical resource to ameliorate various diseases including stroke and other nervous system diseases.<sup>[7]</sup> The effectiveness of acupuncture is closely related to the effective intervention of related risk factors of diseases. At present, there have been many systematic reviews to assess the intervention effect of acupuncture on related risk factors of diseases. Systematic evaluation is level evidence in the JBI (Joanna Briggs Institute) evidence classification. However, if the methodological quality of the system evaluation itself is not high, it will directly affect the credibility of its evidence.

Therefore, it is very important to carry out the reevaluation research on the system evaluation itself. This paper intends to reevaluate the current systematic evaluation of acupuncture intervention on metabolic risk factors of stroke, with a view to verifying the reliability and feasibility of acupuncture intervention on risk factors in the absence of high-quality evidence-based practice guidelines for stroke, and providing indirect reference evidence for acupuncture prevention and treatment of stroke.

## 2. Materials and Methods

### 2.1. Literature search and selection

Systematic search and screening procedures were carried out with the assistance of trained public health librarians. The following databases are systematically checked: the PubMed, Embase, Cochrane Library, CNKI, VIP, and Wanfang databases, which were set up until December 15, 2021. The references included in the systematic evaluation/meta-analysis were retrieved as a supplement. The Chinese search MeSH terms included acupuncture, body acupuncture, electroacupuncture, hypertension, regulating blood pressure, diabetes, blood sugar, insulin resistance, hyperlipidemia, lipid metabolism, obesity, overweight, systematic evaluation, meta-analysis, and meta-evaluation. The English search Mesh terms included acupuncture, electroacupuncture, hypertension, diabetes mellitus, meta-analysis, and systematic review, etc.

Inclusion criteria: (1) Types of article: all systematic evaluations or meta-analyses related to the metabolic risk factors for stroke treated with acupuncture. (2) Subjects: the diseases included hypertension, hyperlipidemia, obesity, and diabetes and were not limited to sex, age, race, nationality, or degree of disease.

(3) Intervention measures: the treatment group was treated with acupuncture (including acupuncture, electroacupuncture, or ear acupuncture) or with acupuncture that was mainly supplemented with other nonacupuncture therapy, and the control group was treated with placebo therapy (blank control or false acupuncture) or other nonacupuncture therapy.

Exclusion criteria: acupuncture as a nonmain intervention, such as acupoint compression, acupoint catgut embedding, moxibustion alone, and laser acupuncture; patients exhibiting metabolic high-risk factors complicated with other diseases; nonsystematic evaluation or meta-analysis; conference abstracts, letters, or reviews; failure to find full text or incomplete content; repeated literature; comparative studies between different acupuncture therapies; and plans for systematic evaluation.

### 2.2. Literature screening and extraction

Each of them carries on the the retrieval was performed by each researcher independently according to the preset retrieval strategy, and if the cross-check showed a difference, a third party analyzed the results. In cases with a lack of content and information, we attempted to contact the author. The extracted contents included the following: literature source, type of inclusion study, number of inclusion study, sample size, main outcome index, treatment group intervention, control group intervention, and bias risk assessment tool.

### 2.3. Quality evaluation

The PRISMA statement, AMSTAR 2<sup>[8]</sup> and the GRADE tools<sup>[9]</sup> were used for quality evaluation. The PRISMA consists of 7 parts: title, abstract, introduction, methods, results, discussion and funding, which contains 27 items with the judgment result of yes or no. The AMSTAR 2 evaluation tool contains 16 items, which involve the entire process of selecting topics, designing, registering, data extraction, statistical analysis, discussion of systematic evaluation, research questions, PICO elements of the inclusion criteria, systematic evaluation plan, type of research design included, literature retrieval strategy, literature screening, specific details of excluding the literature, bias risk assessment of the inclusion study, rationality of the statistical analysis, accuracy of the result interpretation, financial support, and conflict of interest. References were random or nonrandom..., and entries 2, 4, 7, 9, 11, 13, and 15 were key entries that had a significant impact on the evaluation of the results. The GRADE evaluation tools mainly included 5 items: the limitation of the study, inconsistency of the results, indirect evidence, accuracy, and publication bias.

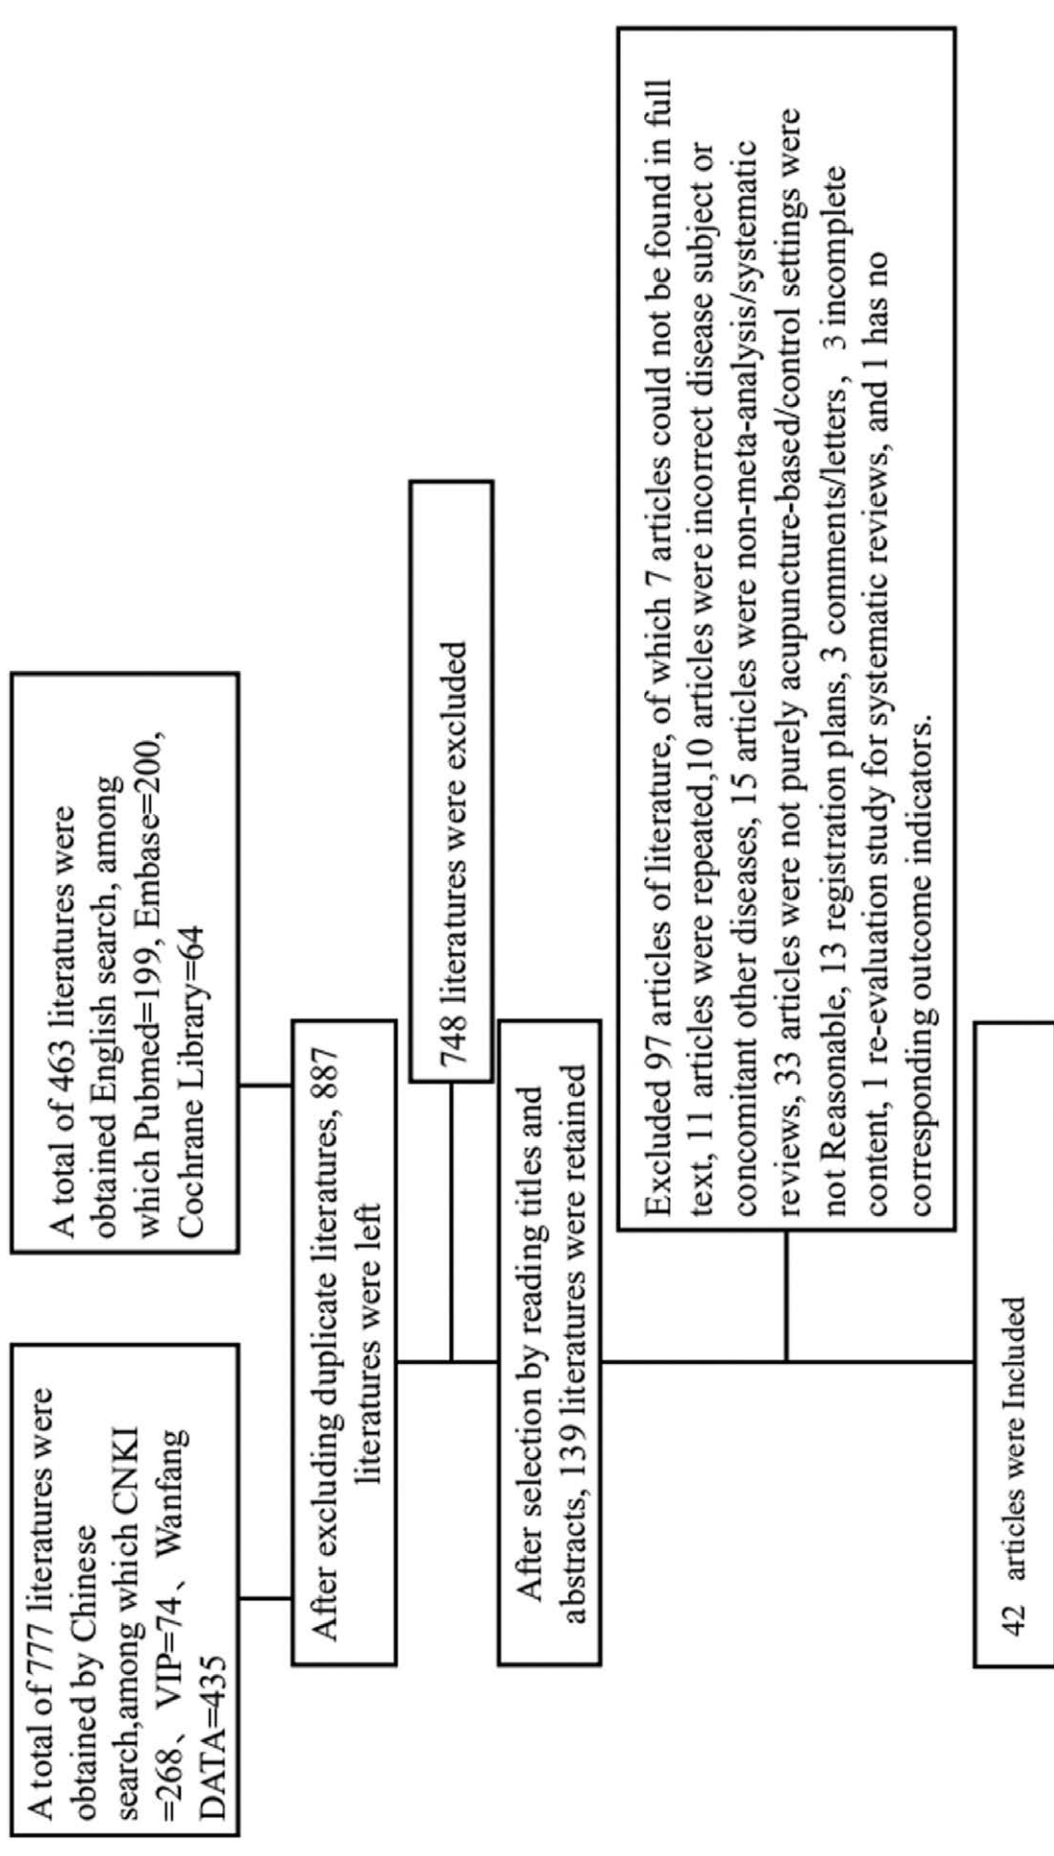

## 3. Results

### 3.1. Literature screening process and results

A total of 1240 documents were identified through the systematic literature search, 887 articles left after removing duplicates. After consulting the title and abstract, 139 articles were selected. Our criteria included reexclusion of literature (n = 97) due to missing full text (n = 7), repeated literature (n = 11), incorrect disease subject or concomitant other diseases (n = 10), nonmeta-analysis/systematic evaluation (n = 15), nonpure needle-based/unreasonable control setting (n = 33), registration plan (n = 13), comments/letters (n = 3), and incomplete content (n = 3). The final number of publications included in this study was 42. The selection process is shown in Figure 1. A summary of the characteristics of the included articles is presented in Table 1.

### 3.2. Quality assessment of included systematic reviews

Quality assessment of the 42 included articles showed the acceptable quality, with an obvious improvement of bias assessment methods and analyzing methods. The AMSTAR-2 evaluation tool was used to evaluate the quality of 42 included articles,<sup>[10-51]</sup> and the results showed that 4 articles were evaluated as low quality and 38 articles were evaluated as very low quality, as shown in Table 2. The mean AMSTAR-2 score was 6.476 (Yes = 1, Partial Yes = 0, No = 0, complete score 16). The highest score is 12, and the lowest score is 1 (Table 1). Seven articles achieved good AMSTAR-2 score ("Y" ≥ 60%).<sup>[11,13,21,22,33,37,40]</sup> Among the key items, the complete coincidence rate of item 2 was 0 ("Y" = 0%), because all the literature did not describe the research plan before implementation in detail, and only some literature indicated that the plan had been written in advance. This will be judged as Partial Yes. In item 4 and 7, literature<sup>[11,13,19,21,22,33,37]</sup> had complete literature retrieval strategies, and supplementary

**Figure 1.** Identification: A total of 1240 documents were identified by systematically checked (777 literatures from Chinese databases, 463 literatures from English databases) each database Until December 15, 2021, search for relevant eligible randomized controlled trials with keywords or Mesh terms "acupuncture," "body acupuncture," "electroacupuncture," "hypertension," etc. In total, 887 articles left after removing duplicates. 2. Screening and extraction: By carefully reading the titles and abstracts of the literature, and according to the inclusion and exclusion criteria, the related literature was screened to determine whether it would be included in subsequent studies. If there is a dispute or a divergent issue, it will be resolved through internal consultation or discussion with a third party. A total of 139 articles were selected. 3. Included Full-text articles were assessed for eligibility, studies included in qualitative synthesis(systematic reviews) were 42.

**Table 1**

**A summary of the characteristics of the literature included.**

Literature	Type of study included	Number of studies included	Sample size	Male/female	Age	Treatment group intervention	Control group intervention	Outcomes
Hyangsook Lee 2009 <sup>[10]</sup>	Randomized controlled trial	11	847	No limitation	40-72	Acupuncture and moxibustion + medicine	Fake acupuncture, fake acupuncture + medicine	Systolic and diastolic blood pressure
Chen C. 2019 <sup>[11]</sup>	Randomized controlled trial	21	1943	Na	Mean age > 18	Acupuncture, auricular acupuncture, laser acupuncture, acupoint catgut embedding combined therapy	Western medicine	Blood sugar, 2h blood sugar, glycosylated hemoglobin
Chen, 2018 <sup>[12]</sup>	Randomized controlled trial	30	2107	1066/963/ Not reported	Mean age > 18	Acupuncture and electroacupuncture	False acupuncture, western medicine, nontreatment, lifestyle intervention	Efficiency of blood pressure improvement, systolic and diastolic blood pressure
Cho, 2009 <sup>[13]</sup>	Randomized controlled trial	31	3013	Na	no limitation	Acupuncture	Lifestyle interventions	Weight, obesity reduction efficiency
Dong-ZeLi 2014 <sup>[14]</sup>	Randomized controlled trial	4	386	Na	Mean age > 18	Acupuncture and moxibustion + western medicine	Fake acupuncture, fake acupuncture + western medicine	Systolic and diastolic blood pressure
Junpeng Yao 2019 <sup>[15]</sup>	Randomized controlled trial	12	1151	Na	>18/Not mentioned	Acupuncture, electroacupuncture + laser acupuncture, acupuncture + diet training, training,	Placebo, sham needle, diet training, no treatment	BMI, waistline reduction
KepeiZhang 2018 <sup>[10]</sup>	Randomized controlled trial	21	1389	no limitation	no limitation	Acupuncture, electroacupuncture, body acupuncture, acupoint catgut embedding	False acupuncture, no treatment	BMI, weight, fat loss

retrieval was carried out for gray literature. Item 7, only one study<sup>[21]</sup> provided a detailed list of exclusions and reasons. In item 9 and 26, articles,<sup>[11,12,15,16,18-24,26,27,29,31-33,35-37,39,40,45-47,51]</sup> appropriate tools were used to assess the risk of bias in the included literature. In item 11 and 18, articles<sup>[11-13,16,20-23,27,30,32-34,39,40,44,45,50]</sup> were analyzed using appropriate statistical methods, and subgroup analysis was conducted for those with relatively high heterogeneity included. Items 13 and 24, articles<sup>[10,11,13,14,16-23,29-31,33,34,36,37,39-41,44,49]</sup> fully discussed the risk of bias in the included articles and the possible causes. Items 15 and 20, articles<sup>[11-13,15,17-19,25,26,28,33,34,36,37,40,43,44,46,48,51]</sup> were conducted for the research of migration (Table 2).

Note: Entry 1 refers to whether the question and criteria include PICO elements. Entry 2 is a systematic evaluation of whether the report was designed in advance and whether there are significant differences between the content of the report and the proposed program. Item 3 explains the choice of study design type. Entry 4 refers to whether a comprehensive literature retrieval strategy has been used in accordance with partial conformity. Entry 6 refers to the repeatability of the study screening and data extraction. Entry 7 is for the purpose of listing and proving that the exclusion partially complies. Item 8 describes in detail the contents of the NAI. Entry 9 is partially consistent with the use of appropriate methods to assess bias between natal studies. Item 10 provides information on the sources of funding for the NA study. Entry 11 is the suitability of the method for combining results. Entry 12 assesses the potential impact of the bias of the natal study on the meta-analysis results and other evidence synthesis, on interpreting and discussing the results of

the systematic evaluation, and on understanding the bias of the NA study. Entry 14 is for a reasonable approach and to explain or discuss the heterogeneity observed in the evaluation results. Entry 15 is a quantitative merger and full investigation of publication bias to discuss its possible impact on the evaluation results. Entry 16 is for any potential conflict of interest reported and includes any funds received for systematic evaluation. Y: yes, N: no, PY: partially consistent.

### 3.3. Impact on blood pressure

A total of ten articles evaluated the effects of acupuncture on blood pressure improvement. Among them, six articles showed that acupuncture + western medicine exerted better antihypertensive effects than western medicine. Eight articles showed that acupuncture exerts a better antihypertensive effect than western medicine. Two articles showed that electroacupuncture exerts better antihypertensive effects than western medicine. Sixteen articles evaluated the reduction of systolic blood pressure due to acupuncture, western medicine, electroacupuncture, and acupuncture + lifestyle, and 3 articles showed that acupuncture + western medicine improved systolic blood pressure better than sham acupuncture + western medicine. Four articles showed that acupuncture was better than sham acupuncture in improving systolic blood pressure. Seven articles showed that acupuncture + western medicine improved systolic blood pressure better than western medicine. Seven articles showed that acupuncture improved systolic blood pressure better than western medicine.. Sixteen articles demonstrated that the effect of acupuncture on

diastolic blood pressure was better than that of sham acupuncture. Acupuncture improved diastolic blood pressure better than western medicine. Acupuncture + western medicine improved diastolic blood pressure better than western medicine. Details are provided in Table 3.

**3.4. Impact on obesity**

The weight loss effect of electroacupuncture was better than that of lifestyle in 5 articles, and two items were statistically significant (one item of moderate quality and one item of low quality). The weight loss effect of acupuncture was better than that of western medicine (two items of low quality). The BMI improvement effect of electroacupuncture was better than that of sham acupuncture (two items of high quality). The BMI improvement effect of body acupuncture was better than that of sham acupuncture (one item of high quality). The BMI improvement effect of acupuncture was better than that of western medicine (one item of low quality and one item of very low quality). The detailed results are shown in Table 4.

**3.5. Impact on blood glucose**

Two articles investigated the blood glucose index and found that the hypoglycemic effect of acupuncture was significantly better than that of western medicine (one low quality). Ear acupuncture was significantly better than western medicine (one low quality). Two articles reported that acupuncture significantly improved glycosylated hemoglobin compared to western medicine (one low quality). Ear acupuncture also significantly improved glycosylated hemoglobin compared to western medicine (one low quality). Laser needle also seemed to be better than western medicine, but the difference was not statistically significant (one low quality). Three articles reported that acupuncture significantly improved the insulin sensitivity index compared to western medicine (one very low quality). The acupuncture-induced improvement in the insulin sensitivity index was significantly better than that of other therapies (one very low quality). The detailed results are shown in Table 5.

**3.6. Impact on lipid**

Three articles reported that acupuncture significantly improved total cholesterol better than western medicine (one moderate quality and two very low quality). Three articles reported that acupuncture improved triglyceride content significantly

better than western medicine (two low quality and one very low quality). Two articles reported that acupuncture significantly improved HDL content better than western medicine (one moderate quality and one low quality). Three articles reported that acupuncture improved LDL results better than western medicine; one difference was statistically significant, and two differences were not statistically significant (two low quality and one very low quality). The specific results are shown in Table 6.

**4. Discussion**

The systematic review synthesizes the existing literature on acupuncture treatment of stroke and comprehensively summarizes the effects of various acupuncture combined with other interventions, which can be used as the basis for personalized treatment of stroke in clinical practice.

Stroke is an acute cerebrovascular disease, which occurs more often in men over the age of 40. Stroke can cause ischemic or hemorrhagic changes in the brain, and cause severe cognitive impairment and limb dysfunction.<sup>[52]</sup> At present, the incidence of complications caused by drug and surgical treatment for stroke is high, and the improvement of patients' prognosis is limited.<sup>[53-56]</sup> Kim Ka found that cerebrovascular injury and the structure and function of the blood-brain barrier were changed under the action of various risk factors.<sup>[57]</sup> The oxidative stress of tissues caused by acute ischemia and hypoxia and the local inflammation caused by harmful factors entering the brain parenchyma through the blood-brain barrier cause damage to the nervous system. Cerebrovascular disease, which is mainly caused by chronic vascular endothelial injury caused by cerebrovascular metabolic risk factors, can directly cause cerebrovascular injury and secondary nerve injury.<sup>[58]</sup> Therefore, intervention of metabolic risk factors such as hypertension, hyperglycemia, dyslipidemia and obesity is an important means to prevent stroke, and this view has also been affirmed by expert consensus.<sup>[5]</sup>

The main outcome indicators of acupuncture intervention all reflect the good efficacy of acupuncture on metabolic risk factors. Results from this study shows that the therapeutic effect of acupuncture intervention on the basis of the original treatment is more objective to a certain extent on the influencing factors of stroke. Related studies have shown that acupuncture is beneficial to improve the systolic blood pressure of patients, and the effect of acupuncture on diastolic blood pressure is better than that of sham acupuncture. In some studies, it has also been found that obesity is an influencing factor. The weight loss effect of acupuncture is better than that of lifestyle and western medicine.

**Table 3**  
**GRADE evaluation results of blood pressure-related indicators.**

Indicators	Source of literature	Measures	MD	Quality of the evidence (GRADE)
Effective rate of blood pressure improvement	Zhang Lei 2017 <sup>[46]</sup>	Acupuncture vs Western Medicine	1.10[1.03,1.17]	MODERATE <sup>1,2</sup>

1. indicates the limitations of the research, 2. indicates the inconsistency of the research results, 3. indicates indirect evidence, 4. indicates precision, 5. indicates publication bias.

The improvement effect of acupuncture on BMI is also better than that of sham acupuncture. In the study of glycemic index of stroke patients, acupuncture significantly improved glycosylated hemoglobin and insulin sensitivity index compared with western medicine. However, there is no evidence that the effect of acupuncture with laser needle is better than that of western medicine. In cholesterol-related research, acupuncture can effectively improve the content of triglycerides. Besides, studies on HDL and LDL show that acupuncture can significantly improve HDL, but has no significant effect on LDL. These results can be used as a foundation for individualized treatment and aid health care professionals in meeting patients' individual needs and preferences.

However, the GRADE evaluation demonstrated that the results regarding blood pressure, obesity, blood sugar, and blood lipids are mainly of low quality and that the evaluation of blood sugar and blood lipids is not of high quality. The reason is that

the limitations and accuracy of research are mainly related to blood pressure and that these studies have inconsistent research results and insufficient indirect evidence. The research results on obesity are inconsistent and inaccurate, and the research regarding blood glucose and blood lipid items is limited, with inaccurate and inconsistent results. This suggests that the sample size included in the systematic evaluation of metabolic risk factors of acupuncture intervention was small. The included systematic reviews of blood glucose and lipids were also downgraded due to limitations, indicating that the relevant clinical trials were not rigorously designed in terms of blindness, allocation concealment, and randomization, which reduced the credibility of the level of evidence.

### 5. Strengths and limitations

It is greatly needed in the area of stroke treatment and rehabilitation, which has a large number of inconsistent studies

**Table 4**

with acupuncture interventions and results. One way to make evidence available to clinical decision makers is by providing them with a summary of available evidence through a SR of SRs. Through such an approach, our study provides a comprehensive evidence base by the standardized retrieval process, and clear and detailed inclusion and exclusion criteria during the study. Besides, there are some limitations in this study. Many of the included literature were of low quality, which may affect the accuracy of the research results. The outcome indicators of the included publications are not uniform, and thus, this study cannot be quantitatively and accurately compared, and there are errors. A potential limitation of this SR of SRs is that when including both SR and meta-analyses there is a risk that the same studies may have been included in more than one SR. Therefore, we chose not to draw conclusions on the number of SRs presented within each area or based on the study design. However, the inclusion of both SRs and meta-syntheses enables a broader scope and a more comprehensive approach to acupuncture interventions of stroke treatment and rehabilitation compared with other SRs. Thus, although there are some limitations in this paper, this paper has systematically and completely collected relevant literature by combining multiple databases, so this paper still has a certain guiding significance.

## 6. Conclusions

This review summarizes the available evidence and underpins findings of the acupuncture exhibited the therapeutic role in eliminating metabolic risk factors for stroke, including systolic blood pressure, weight loss, glycemic index and cholesterol. Acupuncture could have positive effects on a specific symptom, and the effects depend not only on intervention type but also on how and when the intervention is provided. And more prioritizing high-quality research in this field in the future is conducive to guiding clinical practice.

## Author contributions

Study concept and design: Xu.Y. Ge.J-W.and Xu.W-H. All authors contributed significantly to the acquisition, analysis, and interpretation of data; and critical revision of the manuscript for important intellectual content. All authors reviewed the results and approved the final version of the manuscript.
