The condensation of 2-furoic hydrazide and 4-dimethyl aminobenzaldehyde in ethanol yielded a yellow solid formulated as the title compound,  $C_{14}H_{15}N_3O_2 \cdot H_2O$ . The crystal packing is stabilized by intermolecular O(water)–H···O(N(carbohydrazide)) and N–H···O(water) hydrogen bonds, which form a two-dimensional network along the *bc* plane. Additional C–H···O interactions link the molecules into a three-dimensional network. The dihedral angle between the mean planes of the benzene and the furan ring is 34.47 (6) $^\circ$ . The carbohydrazide moiety, *i.e.*, the C=N–N–C=O fragment and the benzene ring are almost coplanar, with an angle of 6.75 (9) $^\circ$  between their mean planes.

## 1. Chemical context

Furan is a colorless toxic chemical produced in various food items during heat processing and in some industrial processes (Delatour *et al.*, 2020; Rehman *et al.*, 2019; Morehouse *et al.*, 2018; Sirot *et al.*, 2019). It has been reported that furan can induce oxidative stress, endocrine disruption and toxic effects on the reproductive system of male rats (Rehman *et al.*, 2019). However, other studies have shown its ability to inhibit tyrosinase, which is an enzyme responsible for many skin disorders and diseases (Barros *et al.*, 2019). Furan derivatives, such as hydrazides, are precursors for a large variety of compounds. For example, receptors for carboxylates were prepared from furoic acid hydrazide (de la Torre *et al.*, 1997). The biological activities of various furoic acid hydrazones have been evaluated against *Mycobacterium tuberculosis* (Sriram *et al.*, 2010), myelogenous leukemia cells (Silva *et al.*, 2014) and for tyrosinase inhibition (Dige *et al.*, 2019). Hydrazones of this type have also been used in the study of interactions of DNA with small organic or metal–organic molecules to help the development of new drugs. Indeed, the elucidation of the mechanisms involved in the interaction of DNA with these small molecules makes it possible to develop models (Sathyadevi *et al.*, 2012; Sennappan *et al.*, 2019). In this paper, we report the synthesis and the characterization of the title compound, obtained from the condensation reaction between furoic acid hydrazide and 4-aminobenzaldehyde.

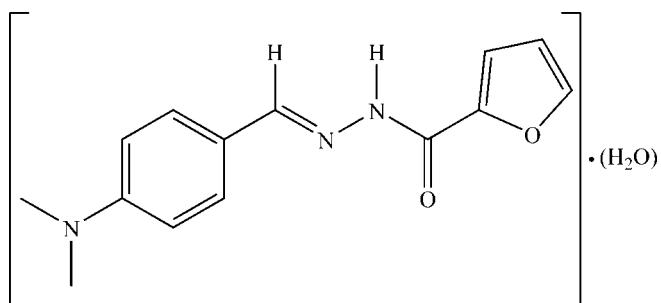

## 2. Structural commentary

The molecular structure of the title compound (**I**) with the atomic-labeling scheme is shown in Fig. 1. The asymmetric unit of **I** contains one molecule of the Schiff base ligand and one

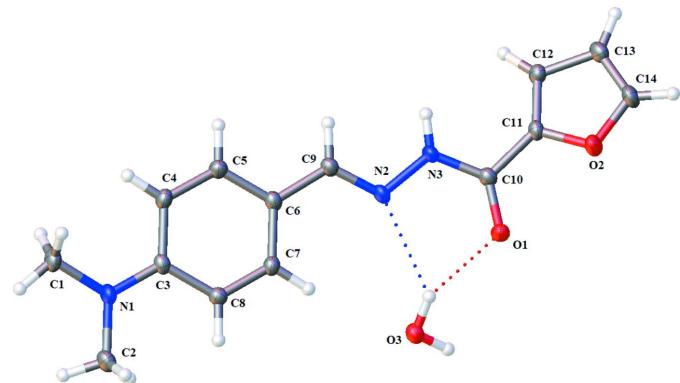

OPEN ACCESS

water molecule. The molecule adopts an *E* configuration with respect to the C9=N2 bond. The carbohydrazide moiety, C9=N2—N3—C10=O, is almost coplanar with the benzene ring, with an angle of 6.75 (9)° between their mean planes. The C10=O1 bond length [1.2392 (16) Å], which has double-bond character, shows that the compound did not undergo enolization as observed in some furoic hydrazide derivatives (Rodríguez-Argüelles *et al.*, 2009). It exists only in the keto form. This form of the Schiff base is further confirmed by the N3—C10 [1.3383 (17) Å] and N2—N3 [1.3846 (14) Å] bond distances, which indicate that these are single bonds and by N2=C9 [1.2832 (17) Å], which is a double bond.

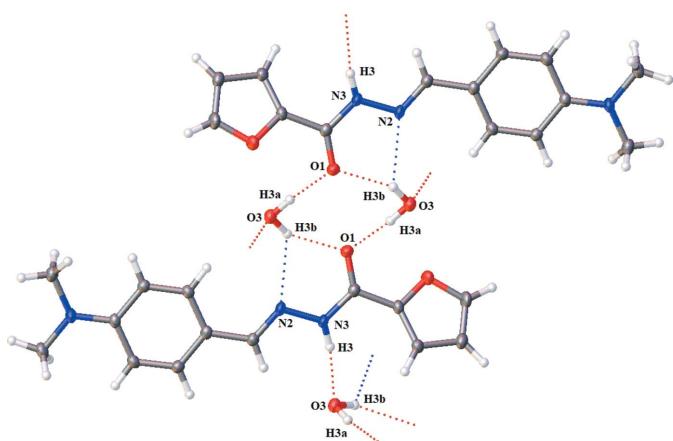

The O1 and N2 atoms are in a *syn* conformation with respect to the C10—N3 link [O1—C10—N3—N2 = −1.2 (2)°]. The dihedral angle between the benzene and the furan rings is 34.47 (6)°. The presence of the lattice water molecule differentiates the title compound **I** from that reported by Li & Meng (2010). In our compound, the oxygen atom of the furan ring and the oxygen atom of the carbonyl group are in a *syn* orientation with respect to the C10—C11 bond [O1—C10—C11—O2 = −26.44 (19)°], similar to what was observed for the compound (*E*)-*N*-(2-hydroxybenzylidene)furan-2-carbohydrazide by Bikas *et al.* (2010). This is in contrast with most hydrazones from furan-2-carbohydrazide, including the anhydrous form of the title compound, which assume an *anti* conformation with respect to the link between the carbonyl atom and the C<sub>ipso</sub> atom of the furan ring (Jiang, 2010; Li & Jian, 2010a,b,c; Li & Meng, 2010).

**Figure 1**

An ORTEP view of the title compound, showing the atom-numbering scheme and intramolecular contacts. Displacement ellipsoids are plotted at the 50% probability level.

**Figure 2**

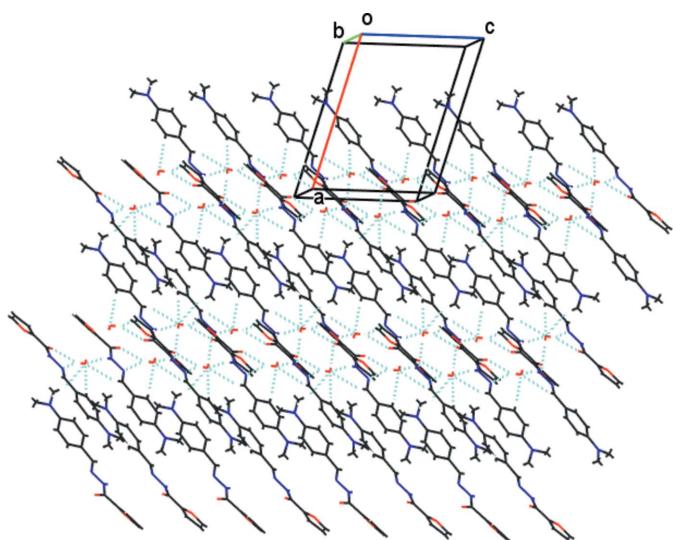

Rings and connections formed by O—H···O, O—H···N and N—H···O hydrogen bonds (dashed lines).

### 3. Supramolecular features

In the crystal, each independent water molecule donates hydrogen bonds to the carbonyl oxygen atom of two ligand molecules, forming a tetramer with R<sub>4</sub><sup>2</sup>(8) rings (Fig. 2, Table 1). One of the hydrogen bonds donated by water is bifurcated between two acceptors, O1 and N2. The structure is built up further around the water molecules by N—H···O<sub>water</sub> hydrogen bonds, thus producing layers parallel to the bc plane. Additional C—H···O interactions interconnect the layers and consolidate the structure into a three-dimensional network (Fig. 3).

### 4. Database survey

Reflecting the interest in compounds similar to **I**, no fewer than 43 associated structures are included in the Cambridge Structural Database (CSD version 5.40, last update November

**Figure 3**

Crystal packing of the title compound, viewed along the *b* axis.

**Table 1**  
Hydrogen-bond geometry ( $\text{\AA}$ ,  $^\circ$ ).

Symmetry codes: (i)  $-x+2, -y+1, -z+1$ ; (ii)  $x, -y+\frac{3}{2}, z+\frac{1}{2}$ ; (iii)  $-x+2, y+\frac{1}{2}, -z+\frac{3}{2}$ ; (iv)  $-x+1, y+\frac{1}{2}, -z+\frac{1}{2}$ .

2018; Groom *et al.*, 2016). Of these, KABNOS (Li & Meng, 2010) has the most similar structure to the title compound, the only differences being the presence of the water molecule and the rotation of the furan ring around the link between the carbonyl C atom and the  $C_{ipso}$  atom of the furan ring in the title compound (see *Structural commentary*). Several hydrazones hits are found with the fragment furan-2-carbohydrazide. The difference between them is the substitution of the aromatic ring by a variety of groups, such as  $\text{NO}_2$  for AZILOM (Wang & Tai, 2016), hydroxyl for CEDZIX (Mohanraj *et al.*, 2016) and DUSZEX (Bikas *et al.*, 2010), a  $\text{CH}_3$  group for DUTJOS (Li & Jian, 2010b), a methoxy group for EMOMUP (Cui *et al.*, 2010) or a halogen atom for GAQKEQ (Bikas *et al.*, 2012). These kinds of Schiff bases were used for preparing complexes with transition-metal or lanthanide ions. The ligand acts in a bidentate or tridentate fashion, as reported in the literature [ABUKIU (Singh *et al.*, 2017), DAZMEX (Haba *et al.*, 2005), FIGMEO (Maurya *et al.*, 2005), and VIVGOY (Alagesan *et al.*, 2014)]. One organometallic palladium complex was found containing a metal–carbon bond in a six-membered ring (TAPXEQ; Qian *et al.*, 2017). One hit corresponds to a calcium complex, in which only the carbonyl oxygen atom is coordinated to the calcium ion (YEDCIW; Tai & Wang, 2017).

## 5. Synthesis and crystallization

All purchased chemicals and solvents were of reagent grade and were used without further purification. The melting point was determined with a Büchi 570 melting-point apparatus and is uncorrected. To a mixture of 0.5 g (3.96 mmol) of 2-furoic hydrazide and 25 ml of ethanol were added a few drops of glacial acetic acid. A solution of 0.59 g (3.96 mmol) of 4-dimethylaminobenzaldehyde in 25 ml of ethanol was added dropwise. The resulting mixture was stirred at 323 K for 24 h. On cooling in an ice bath, a yellow solid appeared after a few minutes. The compound was filtered off, washed with water and diethyl ether, and dried at room temperature; 0.42 g of solid was obtained (yield: 37.96%). A small quantity was purified by recrystallization from a dimethylformamide solution and yellow single crystals suitable for XRD grew within a few weeks.

**Table 2**

Computer programs: *CrysAlis PRO* (Rigaku OD, 2019), *SHELXT* (Sheldrick, 2015a), *SHELXL* (Sheldrick, 2015b) and *OLEX2* (Dolomanov *et al.*, 2009).

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All H atoms of the ligand were located by HFIX, positioned geometrically and allowed to ride on their respective parent atoms, with  $\text{C}-\text{H} = 0.95$  Å ( $\text{C}_{\text{ar}}\text{H}$ ), 0.98 Å ( $\text{CH}_3$ ) or 0.88 Å (NH). Both H atoms of the water molecule were located in a difference-Fourier map, positioned geometrically and refined as a free rotating group with idealized geometry.

Data collection: *CrysAlis PRO* (Rigaku OD, 2019); cell refinement: *CrysAlis PRO* (Rigaku OD, 2019); data reduction: *CrysAlis PRO* (Rigaku OD, 2019); program(s) used to solve structure: *ShelXT* (Sheldrick, 2015a); program(s) used to refine structure: *SHELXL* (Sheldrick, 2015b); molecular graphics: *OLEX2* (Dolomanov *et al.*, 2009); software used to prepare material for publication: *OLEX2* (Dolomanov *et al.*, 2009).

### *N'*-[4-(Dimethylamino)benzylidene]furan-2-carbohydrazide monohydrate

#### Crystal data

$C_{14}H_{15}N_3O_2 \cdot H_2O$	$F(000) = 584$
$M_r = 275.30$	$D_x = 1.334 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71075 \text{ \AA}$
$a = 12.9328 (5) \text{ \AA}$	Cell parameters from 7776 reflections
$b = 11.2551 (4) \text{ \AA}$	$\theta = 2.4\text{--}31.3^\circ$
$c = 9.8092 (3) \text{ \AA}$	$\mu = 0.10 \text{ mm}^{-1}$
$\beta = 106.245 (4)^\circ$	$T = 100 \text{ K}$
$V = 1370.82 (9) \text{ \AA}^3$	Block, yellow
$Z = 4$	$0.20 \times 0.06 \times 0.06 \text{ mm}$

#### Data collection

XtaLAB AFC12 (RCD3)	$T_{\min} = 0.536$ , $T_{\max} = 1.000$
diffractometer	14982 measured reflections
Radiation source: Rotating-anode X-ray tube,	3102 independent reflections
Rigaku (Mo) X-ray Source	2649 reflections with $I > 2\sigma(I)$
Mirror monochromator	$R_{\text{int}} = 0.059$
Detector resolution: 10.0000 pixels $\text{mm}^{-1}$	$\theta_{\max} = 27.5^\circ$ , $\theta_{\min} = 2.4^\circ$
$\omega$ scans	$h = -16 \rightarrow 15$
Absorption correction: gaussian	$k = -12 \rightarrow 14$
(CrysAlis Pro; Rigaku OD, 2019)	$l = -12 \rightarrow 12$

#### Refinement

Refinement on $F^2$	Primary atom site location: dual
Least-squares matrix: full	Hydrogen site location: mixed
$R[F^2 > 2\sigma(F^2)] = 0.048$	H-atom parameters constrained
$wR(F^2) = 0.136$	$w = 1/[\sigma^2(F_o^2) + (0.0786P)^2 + 0.3872P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
3102 reflections	$(\Delta/\sigma)_{\max} = 0.001$
186 parameters	$\Delta\rho_{\max} = 0.37 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.35 \text{ e \AA}^{-3}$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
