Radiofluorination and biological evaluation of *N*-aryl-oxadiazolyl-propionamides as potential radioligands for PET imaging of cannabinoid CB₂ receptors

Rodrigo Teodoro¹⁺, Rareş-Petru Moldovan¹⁺, Corinna Lueg²⁺, Robert Günther¹, Cornelius K Donat¹, Friedrich-Alexander Ludwig¹, Steffen Fischer¹, Winnie Deuther-Conrad¹, Bernhard Wünsch² and Peter Brust^{2*}

Abstract

Background: The level of expression of cannabinoid receptor type 2 (CB_2R) in healthy and diseased brain has not been fully elucidated. Therefore, there is a growing interest to assess the regional expression of CB_2R in the brain. Positron emission tomography (PET) is an imaging technique, which allows quantitative monitoring of very low amounts of radiolabelled compounds in living organisms at high temporal and spatial resolution and, thus, has been widely used as a diagnostic tool in nuclear medicine. Here, we report on the radiofluorination of *N*-aryl-oxadiazolyl-propionamides at two different positions in the lead structure and on the biological evaluation of the potential of the two tracers [¹⁸F]**1** and [¹⁸F]**2** as CB₂ receptor PET imaging agents.

Results: High binding affinity and specificity towards CB_2 receptors of the lead structure remained unaffected by the structural changes such as the insertion of the aliphatic and aromatic fluorine in the selected labelling sites of 1 and 2. Aliphatic and aromatic radiofluorinations were optimized, and $[^{18}F]1$ and $[^{18}F]2$ were achieved in radiochemical yields of $\geq 30\%$ with radiochemical purities of $\geq 98\%$ and specific activities of 250 to 450 GBq/µmol. Organ distribution studies in female CD1 mice revealed that both radiotracers cross the blood–brain barrier (BBB) but undergo strong peripheral metabolism. At 30 min after injection, unmetabolized $[^{18}F]1$ and $[^{18}F]2$ accounted for 60% and 2% as well as 68% and 88% of the total activity in the plasma and brain, respectively. The main radiometabolite of $[^{18}F]2$ could be identified as the free acid $[^{18}F]10$, which has no affinity towards the CB₁ and CB₂ receptors but can cross the BBB.

Conclusions: *N*-aryl-oxadiazolyl-propionamides can successfully be radiolabelled with ¹⁸F at different positions. Fluorine substitution at these positions did not affect affinity and specificity towards CB₂R. Despite a promising *in vitro* behavior, a rather rapid peripheral metabolism of [¹⁸F]**1** and [¹⁸F]**2** in mice and the generation of brain permeable radiometabolites hamper the application of these radiotracers *in vivo*. However, it is expected that future synthetic modification aiming at a replacement of metabolically susceptible structural elements of [¹⁸F]**1** and [¹⁸F]**2** will help to elucidate the potential of this class of compounds for CB₂R PET studies.

Background

Cannabinoid receptors (CBR) belong to the superfamily of G protein-coupled receptors (GPCR) and are involved in various physiological processes. Besides the CBR identified so far, the cannabinoid receptor type 1 (CB_1R) [1] and type 2 (CB₂R) [2], another GPCR natively interacting with endogenous cannabinoids (GPR55) has been proposed as a third type of CBR [3,4]. While the CB₁R is primarily expressed in the central nervous system, the CB₂R is predominantly located in the periphery, especially in tissues related to the immune system. In pathological conditions, the up-regulation of CB₂R expression is mostly associated with inflammatory processes [5,6], neuropathic pain [7-9], Alzheimer's disease, and amyotrophic lateral sclerosis (ALS) [10-13]. It has also been shown that the activation of CB₂R is connected with the induction of apoptosis in several cancer cell lines [14-17]. However, CB₂R are also expressed in healthy brain under physiological conditions at very low expression levels [18,19]. Therefore, the non-invasive quantification of CB₂R in the brain, possibly in general by application of highly sensitive imaging techniques such as positron emission tomography (PET), requires the availability of radioligands binding with high affinity and high specificity towards CB₂R [20]. Apart from the numerous specific pharmacologically relevant ligands of CB₂R reported so far (see [21,22]), only a limited number have been applied for the development of PET radiotracers for imaging of CB₂R [23-29]. As we reported earlier, the increase of brain uptake and metabolic stability and decrease of non-specific binding remained as a challenge for further development [29]. Even a follow-up study on [¹¹C]AZD1940 in nonhuman primate with PET confirmed a relatively low CNS exposure of this radioligand [28]. Mu et al. reported on N-(1-adamantyl)-8-methoxy-4-oxo-1-phenyl-1, 4-dihydroquinoline-3-carboxamide as a ¹¹C-labelled PET probe for imaging of CB₂R [30]. Although the study showed a rather low brain uptake, and two blocking experiments with GW4058233 to demonstrate the specificity of brain uptake were not conclusive, the potential of the compound for PET imaging of amyotrophic lateral sclerosis has been proposed.

Further, a whole-body biodistribution and radiation dosimetry study of the CB₂R ligand [¹¹C]NE40 has been performed in healthy subjects [31]. It showed the expected biodistribution being compatible with lymphoid tissue (spleen) uptake and an appropriate uptake and kinetics in the brain. This underscores the potential of this tracer for application in central and peripheral inflammation imaging. Despite this considerable progress in CB₂R PET imaging, a suitable ligand [32] radiolabelled with the advantageous longer-lived isotope ¹⁸F is still missing.

Recently, we reported on the synthesis, radiofluorination, and first biological investigation of the *N*-aryl-oxadiazolyl-

propionamide [¹⁸F]**2** as a potential radioligand for the PET imaging of CB₂R [29]. Although the initial radiofluorination approach using a nitro precursor proved to be unsatisfactory (yields \leq 3%), the promising biological findings encouraged us to revise and upgrade the radiosynthesis of [¹⁸F]**2** and to perform a more detailed biological evaluation.

Methods

We describe an improved synthesis of $[^{18}F]2$ using a trimethylammonium precursor for the radiolabelling at the aromatic site of the lead structure (Figure 1, compound **13**, $X^2 = NMe_3^+I$). In parallel, we explored the aliphatic radiofluorination at the carbazole *N*-alkyl chain (Figure 1, compound **15**, $X^1 = OTs$). The labelling of the lead compound at two different sites opens up the possibility to investigate the dependence of affinity, biodistribution and metabolism of these radiotracers on the site of radiolabelling.

Results and discussion

Synthesis of *N*-arylamide oxadiazoles: precursors for radiochemistry and reference compounds

In a previous study, we have described the synthesis of >20 fluorinated *N*-arylamide oxadiazoles including labelling precursors for radiochemistry [29]. Here we describe a modified and improved route to obtain novel derivatives for high-yield radiochemistry. In brief, treatment of the nitriles **3** and **4** with excess of hydroxylamine hydrochloride under alkaline conditions delivered the (*Z*)-amidoximes **5** and **6** in 55% and 73% yield together with amides 7 and **8** (Scheme 1), which have been separated by column chromatography on silica. The *Z* configuration of

the amidoximes was determined by two-dimensional nuclear magnetic resonance (NMR) spectroscopy. Treatment of the amidoximes **5** and **6** with excess of succinic anhydride delivered the acids **9** and **10** in a nearly quantitative manner. The *N*-aryl-oxadiazolyl-propionamides **11** and **2** were obtained in high yields (85% and 78%) by using N, N'-diisopropylcarbodiimide (DIC) as coupling reagent [33].

For the aromatic radiofluorination, trimethylammonium iodide has been used as a leaving group. Although methyl iodide (MeI) has a very high nucleophilicity, the choice of I⁻ as a counter ion speeds up the displacement of the trimethylammonium salt in an aromatic ring during radiofluorination under mild conditions [34], thus lowering the amount of potential formation of non-radioactive and radioactive by-products. The trimethylammonium salt **13** was synthesized from the nitro derivative **11** by reduction, reductive methylation with paraformaldehyde and NaBH₄ [35], and quaternization by employing large excess of MeI (Scheme 2) [36].

The ethanol derivative **14** was synthesized in four steps and 28% overall yield starting from the commercially available carbazole (**23**). The synthesis started with deprotonation of carbazole with *n*-BuLi, reaction of the carbazolyl anion with ethylene sulfate, and subsequent hydrolysis with dilute H₂SO₄ to afford the hydroxyethyl derivative 25 (see 'Experimental' section). The crystalline cyclic ethylene sulfate represents a non-toxic but reactive alternative to the gaseous and toxic oxirane. However, there are only few examples for the introduction of a 2-hydroxyethyl group using ethylene sulfate. Nitration of the hydroxyethylcarbazole 25 was performed with concentrated nitric acid at 5°C to 10°C to give the 3-nitro carbazole derivative [37] 24 in 54% yield (Scheme 1). Reduction of the nitrocarbazole 24 with H_2 in the presence of Pd/C provided the primary aromatic amine 26, which was precipitated as HCl salt. The final coupling of the carbazolamine 26 with the propionic acid 10 was induced by COMU[®] providing the amide 14 (Scheme 1).

The fluoroethyl reference compound 1 was prepared by treatment of 14 with the fluorinating agent diethylaminodifluorosulfonium tetrafluoroborate (XtalFluor-E^{*}) (Scheme 2). In order to obtain the precursor for the radiosynthesis, the alcohol 14 was transformed into the tosylate 15 since the tosyloxy moiety represents a good leaving group for the nucleophilic substitution with [¹⁸F]fluoride.

For investigations regarding the main metabolite [¹⁸F]**10**, the trimethylammonium salt **18** and reference compound **17** were synthesized. Intermediate **16** was obtained by acid protection followed by reduction from **9**. To synthesize the reference compound **17**, Sandmeyer reaction has been applied [38]. The use of tetrafluoroborate as fluorinating reagent led to the formation of a complex reaction mixture whereas the use of KF delivered **17** in 40% yields. Alternatively, **17** could also be obtained from **10** (not shown in Scheme 3, see 'Experimental' section) in improved yield. The trimethylammonium salt **18** was obtained as described above in 48% over two steps.

Radiochemistry

Reaction conditions, purification, and formulation procedures were optimized to achieve a high radiochemical yield (RCY) and a high radiochemical purity in a short synthesis time. Aliphatic and aromatic radiolabellings were carried out at 82°C in MeCN under no-carrier-added (NCA) conditions (Scheme 4). High labelling yields (Figure 2) were obtained using 2 mg of precursor. For [¹⁸F]**1**, the optimal conversion of the tosylate **15** was achieved after 10 min (53 ± 6%, n = 12). For [¹⁸F]**2**, a maximum was reached after 10 min (63 ± 5%, n = 7), along with a steady loss of product (51 ± 6%, 15 min)

thereafter, probably due to the decomposition of the trimethylammonium salts under prolonged heating [39]. Altogether, evaluating the current results of labelling of $[^{18}F]^2$, a great improvement was obtained by using the herein described new trimethylammonium precursor 13 instead of the formerly applied nitro compound 11 (see Scheme 4) where a radiochemical yield of only 3% has been achieved [29].

Reaction mixtures were separated by isocratic semipreparative HPLC, fractions were collected, and the identities confirmed by spiked analytical HPLC samples with the respective reference compounds of [¹⁸F]1 and [¹⁸F]2 (Figure 3). Final purification was performed by solid phase extraction (SPE) using Sep-Pack cartridges, and for biological investigations, the products were formulated in isotonic saline containing 10% EtOH. The radiotracers were produced with 30% to 35% RCY, high radiochemical purities (≥98%), and high specific activities (250 to 450 GBq/µmol, n = 4).

In vitro stability and logD determination

Investigations on the *in vitro* stability of $[^{18}F]1$ and $[^{18}F]2$ were performed prior to the experimental determination of logD values. $[^{18}F]1$ exhibited a slight tendency to de-fluorinate at 40°C in Tris–HCl, EtOH, 0.9% NaCl, and Dulbecco's phosphate buffer with 89%, 93%, 95%, and 94% of intact tracer after 30 min of incubation and no further decrease up to 90 min. $[^{18}F]2$ showed a very high stability with ≥98% of intact tracer at incubation in all selected media up to 90 min. Radio-thin-layer chromatography (TLC) and radio-HPLC analyses were in good agreement, and no further radioactive degradation products were observed.

Regarding the HPLC-based logD determination, differences were noticed between isocratic and gradient elutions using the same column. However, as compiled in Table 1, the logD values using Reprosil-Pur C18 AQ column under gradient conditions are in good agreement with those found with Prodigy 5 μ m C8 column.

Receptor affinity

The substitution of the ethyl chain of the carbazole moiety in **2** with a fluorine-ethyl chain in **1** had little effect on target affinity and specificity as reflected by comparable K_i values for the CB₂R (**1**, K_i 2.32 ± 2.12 nM; **2**, K_i 4.27 ± 3.03 nM) [29]. Based on the data published by Cheng et al. [40] (JCPDS 42–44), an agonistic profile of **1** and **2** can be assumed. Both compounds possess no affinity towards the CB₁R ($K_i > 1 \mu$ M). By contrast, one major brain-penetrating metabolite, compound **10**, shows almost no binding towards the CBRs (K_i _{CB1R} > 1 μ M, K_i _{CB2R} > 1 μ M). In accordance with the *ex vivo* autoradiographic studies on [¹⁸F]**2** in spleen tissue slices [29], compound [¹⁸F]**1** targets CB₂R *in vivo* too. The autoradiograms are shown in Figure S1 of Additional file 1.

Organ distribution of [¹⁸F]1 and [¹⁸F]2 in mice

The biodistribution of compounds $[^{18}F]\mathbf{1}$ and $[^{18}F]\mathbf{2}$ in percentage of injected dose per gram (% ID/g) at 5, 30,

and 60 min post injection (p.i.) is compiled in Tables 2 and 3. For both radiotracers, the highest uptake was detected at 5 min p.i. in the spleen. Comparable kinetics were observed in the brain and most other organs such as the lung, liver, kidney, thymus, and adrenals after administration of $[^{18}F]1$ and $[^{18}F]2$, respectively. Both compounds showed a high gastrointestinal excretion as

^aExperiments performed with the respective reference compounds (n = 3 to 6).

reflected by the constant increase of activity uptake in the small intestine. A constantly low uptake of activity in the femur indicates no confounding defluorination during the experiment.

The highest accumulation of activity was found in the kidneys and liver for both compounds. While the activity uptake is higher in the kidneys for $[^{18}F]1$, the values for $[^{18}F]2$ are higher in the liver, indicating different excretion patterns.

Blocking experiments were performed with preadministration of the CB_2R -specific inverse agonist SR144528. At 60 min, the animals were sacrificed and the percentage of injected dose per gram of activity uptake was calculated for the various organs. No significant reduction of percentage of injected dose per gram could be observed for both compounds in any of

Table 2 Radioactivity uptake in major organs of female CD1mice after intravenous administration of 300 to 400 kBq [¹⁸F]1

Blocking was performed with pre-administration of SR144528 (3 mg/kg i.p.). Values are mean \pm SD. ^an = 4, ^bn = 5, ^cn = 6.

the organs investigated including CB_2R -expressing organs (details are compiled in Additional file 1: Table S1). For $[^{18}F]2$, the pre-administration of SR144528 led to an increase of percentage of injected dose per gram in some organs, which might be related to metabolic processes.

Interestingly, major differences between the radioactivity uptakes in various organs were found for $[^{18}F]\mathbf{1}$ and [¹⁸F]**2**. Figure 4 shows all organs (plus the blood and liver) in which significant differences in radioactivity uptake were found at 60 min after injection of the two radiotracers. The measured radioactivity was higher after application of $[^{18}F]\mathbf{1}$ in those organs expressing CB₂R natively [18] in comparison to the data obtained after injection of [¹⁸F]**2**. This relation is reversed in those organs associated to excretion. The cause of this is probably related to the much faster metabolism of $[^{18}F]2$ and its radiometabolites compared to that of [¹⁸F]1, which is in agreement with the observation of significantly lower accumulation of radiolabelled compounds in the plasma and kidney.

The significant differences in the pancreas and femur can be considered as a further indicator of different metabolic processes of $[^{18}F]\mathbf{1}$ and $[^{18}F]\mathbf{2}$ leading to different radiometabolites with diverse organ distribution patterns. Thus, the activity measured in the *ex vivo* biodistribution study is largely determined by metabolites bearing the ^{18}F label.

Metabolism of [¹⁸F]1 and [¹⁸F]2 in mice

Typical HPLC radiochromatograms of brain extracts are shown in Figure 5. In general, radio-TLC analytics of plasma, urine, and brain samples obtained at 30 and 60 min p.i. of $[^{18}F]\mathbf{1}$ or $[^{18}F]\mathbf{2}$ are consistent with the data obtained by radio-HPLC. As shown in Table 4, unmetabolized $[^{18}F]\mathbf{1}$ accounted for 60% of the recovered activity in plasma samples at 30 min p.i., while 36% of the total radioactivity can be addressed to a more hydrophilic metabolite $\mathbf{M1}_{a}$. The amount of intact radiotracer $[^{18}F]\mathbf{1}$ is further reduced at 60 min p.i. to 7% with a concomitant increase of $\mathbf{M1}_{a}$ to 92%.

Radiochromatograms of brain samples at 30 min p.i. shown in Figure 5 revealed that unmetabolized radiotracer corresponded to 68% and 88% of the total activity after administration of [¹⁸F]**1** and [¹⁸F]**2**, respectively. Paralleled by the constantly increasing accumulation of radiometabolites in the brain, these values decreased to 35% and 43%, respectively, at 60 min p.i. In particular, these radiometabolites account for 13% (**M1**_a) and 10% (**M2**_a) as well as 8% (**M1**_b) and 3% (**M2**_b) of total activity at 30 min p.i. of [¹⁸F]**1** and [¹⁸F]**2**, respectively, with the main radiometabolites **M1**_a and **M1**_b reaching values of 58% and 51% at 60 min p.i., respectively. The radiometabolite **M2**_a of [¹⁸F]**1** corresponds most likely to the amine, which is formed by enzymatic hydrolysis of the amide bond in the compound.

Table 3 Radioactivity uptake in major organs of female CD1 mice after intravenous administration of 300 to 400 kBq [¹⁸F]2

Blocking was performed with pre-administration of SR144528 (3 mg/kg i.p.). Values are mean \pm SD. ^an = 3, ^bn = 2.

The total amount of activity measured in, e.g. the plasma at particular times p.i. also depends on the kinetics of the excretion of radiotracer/radiometabolites. For $[^{18}F]2$, this is more pronounced than for $[^{18}F]1$ with unmetabolized $[^{18}F]2$ accounting for only 2% of the total radioactivity in the plasma at 30 min p.i. At

this time, more than 90% of the recovered activity in plasma samples for [18F]2 consisted of the single radiometabolite M1_b. As this value decreases only slightly up to 60 min p.i. (88%), M1_b can be assumed as a rather metabolically stable compound. This radiometabolite of [¹⁸F]2 probably corresponds to the N-aryl-oxadiazolylpropanoic acid resulting from enzymatic hydrolysis of the amide bond of 2 [40]. To prove this assumption, the trimethylammonium salt 18 was synthesized as the precursor of this metabolite. In order introduce ¹⁸F into the molecule, the carbon acid moiety was protected as a methyl ester resulting in the labelled compound [¹⁸F]17 (Scheme 5). It was expected that after injection of this compound in mice, the ester will be converted into the free acid [¹⁸F]10. Those metabolic pathways are common for drug inactivation and excretion [41] as well as for the prodrug concept providing pharmacologically active metabolites in vivo from pharmacologically inactive compounds [42]. After intravenous injection of [¹⁸F]17 in CD1 mice, samples of the plasma, brain, and spleen were analyzed at 30 and 60 min p.i. (Table 5).

As expected, the methylester $[^{18}F]$ **17** ($t_R = 36$ min) is completely converted to free acid $[^{18}F]$ **10** ($t_R = 22$ min) in the plasma samples already at 30 min p.i. (Scheme 5). Radio-HPLC analysis of brain samples at 60 min p.i., spiked with the reference compounds **2** and **10**, confirmed

that the radiometabolite $M1_b$ co-elutes with compound 10 (Figure 6).

Furthermore, in combination with the time-activity data presented in Table 5, this result indicates that the main radiometabolite $\mathbf{M1}_{\mathbf{b}}$ of [¹⁸F]**2** derived from peripheral metabolism ([¹⁸F]**10**) penetrates the blood–brain barrier (BBB). In addition, analyses of brain and spleen sample data revealed that no further metabolic transformation of [¹⁸F]**10** could be observed up to 60 min p.i. as shown in Figure 7.

In vitro investigation of the affinity of **10** towards both hCB_2R and hCB_1R revealed no specific binding ($K_i > 1 \mu M$). Altogether, these data suggest that non-

Table 4 Relative percentages of intact tracer andradiometabolites in plasma samples

target binding radiometabolites of $[{}^{18}F]\mathbf{1}$ and $[{}^{18}F]\mathbf{2}$ account for the vast majority of *ex vivo* activity measured in the spleen and other organs known to express CB₂R. This corresponds very well with the insignificant displacement of activity after administration of $[{}^{18}F]\mathbf{1}$ and $[{}^{18}F]\mathbf{2}$ by the CB₂R-specific SR144528. Hence, radiometabolites generated in the periphery penetrate the BBB leading to a pronounced accumulation of the main radiometabolites in the brain, hampering the application of $[{}^{18}F]\mathbf{1}$ and $[{}^{18}F]\mathbf{2}$ for imaging of CB₂R in the brain.

Experimental

Materials and general procedures

Unless otherwise noted, moisture-sensitive reactions were performed under dry nitrogen or argon. All chemicals and reagents were purchased from commercially available sources and used without further purification unless otherwise specified. Tetrahydrofuran (THF) was dried with sodium/benzophenone and was freshly distilled before use. For the TLC, silica gel 60 F254 plates (Merck KGaA, Darmstadt, Germany) were used. For the flash chromatography (fc), silica gel 60, 40 to 64 µm, (Merck) was used. Room temperature (rt) was 20°C. Melting point was determined using Stuart[™] Melting point apparatus SMP3 (Bibby Scientific Ltd, Staffordshire, UK), uncorrected. Mass spectrometry (MS) was done using MAT GCQ (Thermo Finnigan

MAT GmbH, Bremen, Germany). ¹H, ¹³C, and ¹⁹F NMR spectra were recorded on VARIAN GEMINI 2000 (200 MHz for ¹H NMR, 50 MHz for ¹³C NMR, 188 MHz for ¹⁹F NMR), VARIAN MERCURY plus (300 MHz for ¹H NMR, 75 MHz for ¹³C NMR, 228 MHz for ¹⁹F NMR), and VARIAN MERCURY plus and BRUKER DRX-400 (400 MHz for ¹H NMR, 100 MHz for ¹³C NMR, 367 MHz for ¹⁹F NMR); δ (in ppm)was related to tetramethylsilane and trichloro-fluoro-methane (CF₃Cl), respectively; coupling constants (J) were given with 0.1-Hz resolution. Multiplicities of NMR signals are indicated as follows: s (singlet), d (doublet), t (triplet), m (multiplet), dd (doublet of doublets), and dt (doublet of triplets). HPLC method for determination of the product purity was done with Merck Hitachi Equipment; L-7400 UV detector, L-7200 autosampler, L-7100 pump, and L-7614 degasser were used. The following conditions were used in the experiment: column, LiChrospher® 60 RP-select B, 5 μ m, 250 \times 4.0 mm; flow rate, 1 mL/min; injection volume, 5.0 μ L; detection at λ = 210 nm. Solvents: A: water with 0.05% (ν/ν) trifluoroacetic acid, B: MeCN with 0.05% (ν/ν) trifluoroacetic acid. Gradient elution (A%): 0 to 4 min, 90%; 4 to 29 min, gradient from 90% to 0%; 29 to 31 min, 0%; 31 to 31.5 min, gradient from 0% to 90%; 31.5 to 40 min, 90%.

For radiochemistry, TLC was performed on silica gel pre-coated plates (Polygram, SIL G/UV254) with petroleum ether/ethyl acetate/ammonia (2:1:0.1, $\nu/\nu/\nu$), and the spots were visualized using UV light at 254 nm. Radio-TLC was recorded using a BAS-1800 II system Bioimaging Analyzer (Fuji Photo Film, Co. Ltd., Tokyo, Japan), and images were evaluated with AIDA 2.31 software (raytest Isotopenmessgeräte GmbH, Straubenhardt, Germany). Purification and isolation of the radiotracers were conducted on a semi-preparative radio-HPLC

Table 5 [¹⁸F]10 uptake in female CD1mice after intravenous administration of 100 to 200 kBg [¹⁸F]17

Sample	30 min p.i. (% ID/g)	60 min p.i. (% ID/g)

consisting of a S1021 pump (Sykam GmbH, Eresing, Germany), UV detector (WellChrom Filter-Photometer K-2001; Wissenschaftl. Gerätebau Dr. Ing. Herbert Knauer GmbH, Berlin, Germany), NaI(Tl) counter, and data acquisition by an automated system (Nina, Nuclear Interface, GE Medical Systems, Munich, Germany) on a Reprosil Gold C18, 10 µm, 150 × 4.6 mm, eluent: 58% MeCN/10 mM NH₄OAc aq. at a flow rate of 2.5 mL/min, and Multospher 120 RP-18 AQ, 5 µm, 150 × 10 mm, eluent: 60% MeCN/20 mM NH₄OAc aq. at a flow rate of 2.0 mL/min, respectively for $[^{18}F]\mathbf{1}$ ($t_{\rm R} = 35.3$ min) and $[^{18}\text{F}]2$ (t_{R} = 35.6 min). For the *in vivo* pharmacokinetic metabolite evaluation of $[^{18}F]$ **17** ($t_{\rm R}$ = 19.5 min) semipreparative isolation was performed on a Multospher 120 RP 18 AQ, 5 µm, 150 × 10 mm, eluent: 56% MeCN/ 20 mM NH₄OAc aq. at a flow rate of 2.0 mL/min. Analytical chromatographic separations were performed on a JASCO LC-2000 system (JASCO Labor- und Datentechnik GmbH, Gross-Umstadt, Germany), incorporating a PU-2080Plus pump, AS-2055Plus auto injector (100 µL sample loop) and a UV-2070Plus UV detector (monitoring at 254 nm). All analytical radio-HPLC analyses were performed using a gradient mode on a Multospher 120 RP18 AQ, 5 µm, 250 × 4.6 m. Solvents: A: 10% MeCN/ 20 mM NH₄OAc, B: 90% MeCN/20 mM NH₄OAc.Gradient elution (A%): 0 to10 min, 100%; 10 to 40 min, gradient from 100% to 0%; 40 to 45 min, 0%; 45 to 50 min, 100% at a flow rate of 1 mL/min.

(Z)-2-Bromo-N'-hydroxy-4-nitrobenzimidamide (5) and 2-bromo-4-nitrobenzamide (7)

To a solution of 2-bromo-4-nitrobenzonitrile **3** (100 mg, 0.44 mmol, 1 eq.) in 5 mL MeOH under argon, Na₂CO₃ (56 mg, 0.52 mmol, 1.2 eq.) and NH₂OH-HCl (76 mg, 1.1 mmol, 2.5 eq.) were added at rt, and the reaction mixture was refluxed for 15 h. Upon cooling to rt, 10 mL of H₂O was added and the aqueous phase was washed three times with 10 mL ethyl acetate (EtOAc). The combined organic extracts were dried over sodium sulfate and filtered. Upon evaporation of the solvent, column chromatography was performed (silica, EtOAc/isohexane (IH) 2:8) to give **5** (62 mg, 0.24 mmol, 55%) and 7 (41 mg, 0.17 mmol, 32%) as colorless solids. **5**: ¹H NMR (400 MHz, DMSO-*d*₆): δ

Figure 7 *In vivo* metabolism conversion of [¹⁸F]**17** to [¹⁸F]**10**. Analytical radio-HPLC profiles of the *in vivo* metabolism conversion of [¹⁸F]**17** ($t_R = 36 \text{ min}$) to [¹⁸F]**10** ($t_R = 22 \text{ min}$, Scheme 5b) in plasma, brain, and spleen samples. (A) At 30 min p.i. and (B) at 60 min p.i. Conditions: Multospher 120 RP 18 AQ, 5 µm, 250 × 4.6 mm. Solvents: A: 10% MeCN/20 mM NH₄OAc, B: 90% MeCN/20 mM NH₄OAc.Gradient elution (A%): 0 to 10 min, 100%; 10 to 40 min, gradient from 100% to 0%; 40 to 45 min, 0%; 45 to 50 min, 100% at a flow rate of 1 mL/min. (ppm) = 9.70 (s, 1H), 8.41 (d, J = 2.3 Hz, 1H), 8.21 (dd, J = 8.4/2.3 Hz, 1H), 7.64 (d, J = 8.4 Hz, 1H), 5.99 (s, 2H), 5.99 (s, 2H); ¹³C NMR (100 MHz, DMSO-*d*₆): δ (ppm) = 150.4, 147.8, 141.7, 132.2, 127.3, 122.5, 122.3; MS (ESI+): *m*/*z* (%) = 260/262 (100/100) [M+H]⁺. 7: ¹H NMR (400 MHz, CDCl₃): δ (ppm) = 8.49 (d, J = 2.2 Hz, 1H), 8.24 (dd, J = 8.5, 2.2 Hz, 1H), 7.79 (d, J = 8.5 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃): δ (ppm) = 164.0, 130.6, 128.7, 122.7, 120.0; MS (ESI+): *m*/*z* (%) = 245/247 (100/100) [M+H]⁺.

(Z)-2-Bromo-4-fluoro-N'-hydroxybenzimidamide (6) and 2-bromo-4-fluorobenzamide (8)

Compounds 6 and 8 (pale vellow solids) were obtained under the same synthetic procedure described for compounds 5 and 7 with 2-bromo-1-fluoro-4-nitrobenzene 4 as starting reagent. 6 (yield 73%): ¹H NMR (400 MHz, $CDCl_3$): δ (ppm) = 7.46 (dd, J = 8.6, 6.0 Hz, 1H), 7.35 (dd, J = 8.2, 2.5 Hz, 1H), 7.07 (dt, J = 8.1, 4.4 Hz, 1H);¹³C NMR (100 MHz, CDCl₃): δ (ppm) = 161.7, 151.8, 132.6 (d, J = 8.8 Hz), 120.7 (d, J = 24.7 Hz), 115.1 (d, J = 19.1 Hz), 114.9 (d, J = 19.0 Hz); ¹⁹F NMR (376 MHz, $CDCl_3$: δ (ppm) = -109.3 (dd, J = 14.1, 7.9 Hz); MS (ESI+): m/z (%) = 233/235 (100/100) [M+H]⁺. 8 (yield 5%): ¹H NMR (400 MHz, CDCl₃): δ (ppm) = 7.49 (dd, J = 8.6, 5.9 Hz, 1H), 7.27 (dd, J = 8.4, 2.3 Hz, 1H), 7.00 (td, J = 8.2, 2.4 Hz, 1H), 3.44 (s, 2H); 13 C NMR (100 MHz, CDCl₃): δ (ppm) = 169.7 (d, J = 5.6 Hz), 164.2, 161.7, 133.2, 130.9 (d, J = 9.0 Hz), 120.7 (d, J = 24.7 Hz), 119.9 (d, J = 9.8 Hz), 114.7 (d, J = 21.4 Hz); MS (ESI+): m/z (%) = 218/212 $(100/100) [M+H]^+$.

3-(3-(2-Bromo-4-nitrophenyl)-1,2,4-oxadiazol-5-yl)propanoic acid (9)

The (Z)-2-bromo-N'-hydroxy-4-nitrobenzene-1-carboximidamide 5 (100 mg, 0.38 mmol, 1 eq.) was dissolved in 1 mL of dimethylformamide (DMF) under inert atmosphere. Succinic anhydride (95 mg, 0.95 mmol, 2.5 eq.) and KF (6.7 mg, 0.11 mmol, 0.3 eq.) were added, and the reaction mixture was warmed up to 130°C for 30 min. Upon cooling, 20 mL of H₂O was added and the solid was collected by filtration, washed with H_2O_1 and dried to give 9 as a colorless solid (123 mg, 0.36 mmol, 95%) with a melting point (mp) = 127° C. ¹H NMR (400 MHz, DMSO- d_6): δ (ppm) = 8.57 (d, J = 2.3 Hz, 1H), 8.36 (dd, J = 8.6, 2.3 Hz, 1H), 8.07 (d, J = 8.6 Hz, 1H), 3.23 (t, J = 6.9 Hz, 2H), 2.83 (t, J = 6.9 Hz, 2H); ¹³C NMR (100 MHz, DMSO- d_6): δ (ppm) = 178.8, 173.2, 166.0, 148.4, 133.4, 132.3, 128.5, 122.0, 121.7, 29.5, 21.3; MS (ESI+): m/z (%) = 342/344 $(100/100) [M+H]^+$.

3-(3-(2-Bromo-4-fluorophenyl)-1,2,4-oxadiazol-5-yl) propanoic acid (10)

Compound **10** (colorless solid) was obtained under the same synthetic procedure described for compound **9**

with (*Z*)-2-bromo-4-fluoro-*N*′-hydroxybenzen-1-carboximidamide **6** as starting reagent (yield 95%, mp = 104°C). ¹H NMR (400 MHz, DMSO-*d*₆): δ (ppm) = 7.86 (dd, *J* = 8.7, 6.1 Hz, 1H), 7.82 (dd, *J* = 8.6, 2.6 Hz, 1H), 7.50 to 7.41 (m, 1H), 3.20 (t, *J* = 6.9 Hz, 2H), 2.81 (t, *J* = 6.9 Hz, 2H); ¹³C NMR (100 MHz, DMSO-*d*₆): δ (ppm) = 179.2, 172.7, 164.1, 161.6, 133.6 (d, *J* = 9.4 Hz), 124.3 (d, *J* = 3.5 Hz), 122.1 (d, *J* = 10.1 Hz), 121.4 (d, *J* = 25.1 Hz), 115.5 (d, *J* = 21.6 Hz), 29.9, 21.64; MS (ESI+): *m*/*z* (%) = 315/317 (100/100) [M+H]⁺.

3-(3-(2-Bromo-4-nitrophenyl)-1,2,4-oxadiazol-5-yl)-N-(9-ethyl-9H-carbazol-3-yl)propanamide (11)

To a solution of acid 9 (50 mg, 0.14 mmol, 1 eq.) and 9-ethyl-9H-carbazol-3-amine 12 (30.9 mg, 0.14 mmol, 1 eq.) in 5 mL dichloromethane (DCM), N,N'-diisopropylcarbodiimide (45 µL, 0.21 mmol, 1.5 eq.) was added at 0°C, and the reaction was stirred at rt until 9 and 12 were not visible by TLC control (silica, EtOAc/IH 1:1) (2 h). The reaction was diluted with 5 mL of DCM and washed once with 10 mL 0.5 M aq. HCl, 10 mL 0.5 N aq. NaOH and 10 mL aq. NaCl saturated solution. The organic phase was dried over sodium sulfate and filtered. Evaporation of the solvent afforded a brown solid which was recrystallized from THF to give 11 (63 mg, 0.11 mmol, 85%) as a white solid. ¹H NMR (400 MHz, CDCl₃): δ (ppm) = 8.57 (d, J = 2.0 Hz, 1H), 8.36 to 8.14 (m, 2H), 8.03 (d, J = 8 Hz, 2H), 7.62 to 7.13 (m, 4H), 4.35 (q, J = 7.3 Hz, 2H), 3.49 (t, J = 7.4 Hz, 2H), 3.04 (t, J = 7.4 Hz, 2H), 1.43 (t, J = 7.2 Hz, 3H); MS (ESI+): m/z (%) = 556/558 (100/100) [M+Na]⁺.

3-(3-(4-Amino-2-bromophenyl)-1,2,4-oxadiazol-5-yl)-N-(9-ethyl-9H-carbazol-3-yl)propanamide (19)

To a solution of oxadiazole **11** (30 mg, 0.05 mmol, 1 eq.) and SnCl₂-2H₂O (63 mg, 0.28 mmol, 5 eq.) in 2 mL of EtOH, concentrated aq. HCl (37%) was added at rt. Upon completion (TLC, silica, EtOAc/IH 1:1), 10 mL of saturated aq. NaHCO₃ solution was added, and the mixture was extracted three times with 10 mL of EtOAc. The combined organic extracts were dried over sodium sulfate and filtered. Evaporation of the solvent afforded 19 (17.6 mg, 0.04 mmol, 70%) as a brown solid which was used in the next step without further purification. ¹H NMR (300 MHz, $CDCl_3$: δ (ppm) = 8.17 (d, J = 1.9 Hz, 1H), 7.89 (d, J = 7.8 Hz, 1H), 7.47 (d, J = 8.4 Hz, 1H), 7.37 (dt, J = 9.1)4.6 Hz, 1H), 7.34 to 7.14 (m, 3H), 7.09 to 6.99 (m, 1H), 6.94 (d, J = 2.2 Hz, 1H), 6.61 (dd, J = 8.4, 2.3 Hz, 1H), 4.19 (q, J = 7.2 Hz, 2H), 3.24 (t, J = 7.4 Hz, 2H), 2.86 (t, J = 7.4 Hz, 2H), 1.25 (t, J = 7.2 Hz, 3H); ¹³C NMR $(75 \text{ MHz}, \text{ CDCl}_3)$: δ (ppm) = 178.2, 170.6, 169.2, 167.5, 157.9, 140.4, 137.2, 133.0, 132.7, 129.7, 125.7, 122.8, 122.7, 120.5, 120.4, 119.4, 118.6, 114.5, 112.7, 108.5, 108.4, 37.5, 32.6, 22.4, 13.6; MS (ESI+): m/z (%) = 528/526 (100/100) [M+Na]⁺.

3-(3-(2-Bromo-4-(dimethylamino)phenyl)-1,2,4-oxadiazol-5-yl)-N-(9-ethyl-9H-carbazol-3-yl)propanamide (20)

To a solution of paraformaldehyde (PFA) (7.2 mg, 0.24 mmol, 6 eq.) in 90 µL of H₂O, concentrated H₂SO₄ (13 μ L, 0.24 mmol, 6 eq.) was added, and the reaction was cooled in an ice bath. To the resulting solution, 19 (20 mg, 0.04 mmol, 1 eq.) in 1 mL THF was added, and the reaction mixture was stirred for 30 min at 0°C. Next, NaBH₄ (granules, 9.1 mg, 0.24 mmol, 6 eq.) was added in one portion, and the reaction was stirred for a further 18 h at rt. The reaction was quenched by addition of a concentrated aqueous NaOH solution (pH = 10 to 12), and the resulting aqueous phase was washed with EtOAc. The organic phase was dried over sodium sulfate and filtered. Upon purification by column chromatography (silica, EtOAc/IH 3/7) a yellow-brown solid was obtained which was further purified by recrystallization from THF to give 20 as a colorless solid (11 mg, 0.12 mmol, 53%) with mp = 125°C. ¹H NMR (400 MHz, DMSO- d_6): δ (ppm) = 10.11 (s, 1H), 8.39 (s, 1H), 8.02 (d, J = 7.6 Hz, 1H), 7.66 (d, J = 8.9 Hz, 1H), 7.57 to 7.45 (m, 3H), 7.48 to 7.32 (m, 1H), 7.20 to 7.07 (m, 1H), 6.95 (d, J = 2.6 Hz, 1H), 6.77 (dd, J = 8.9, 2.6 Hz, 1H), 4.38 (q, J = 7.0 Hz, 2H), 3.28 (t, J = 7.0 Hz, 2H), 2.96 (t, J = 7.1 Hz, 2H), 2.95 (s, 6H), 1.27 (t, J = 7.1 Hz, 3H); ¹³C NMR (100 MHz, DMSO- d_6): δ (ppm) = 178.4, 168.6, 167.0, 156.7, 152.1, 139.9, 136.1, 132.2, 131.1, 125.7, 122.0, 121.8, 120.1, 118.8, 118.5, 116.0, 113.4, 111.1, 110.7, 109.1, 108.9, 40.6, 36.9, 32.0, 21.7, 13.6; MS (ESI+): m/z (%) = 556/554 (100/100) [M+Na]+.

3-Bromo-4-(5-(3-((9-ethyl-9H-carbazol-3-yl)amino)-3oxopropyl)-1,2,4-oxadiazol-3-yl)-N,N,Ntrimethylbenzenaminium iodide (13)

To a solution of dimethylamine **20** (53 mg, 0.1 mmol, 1 eq.) in 1 mL of dry DMF under argon, MeI (124 μL, 20 mmol, 20 eq.) was added at rt. The reaction was sealed and warmed up to 35°C. Additional MeI (124 µL, 20 mmol, 20 eq.) was added after 2 and 5 days, while the reaction temperature was maintained at 35°C. Upon solvent evaporation, the resulting thick mass was washed three times with 4 mL of EtOAc to remove trace impurities and unreacted starting material (20). Upon drying, 4 mL of H₂O was added. The mixture was sonicated and placed in a fridge (+4°C) for 1 h. The solid was filtrated and rewashed with 4 mL of ice-cold H₂O. The trimethylammonium salt 13 was obtained as a light brown solid (57 mg, 0.85 mmol, 85%) with mp = 109°C. ¹H NMR (400 MHz,CD₃CN): δ (ppm) = 8.71 (s, 1H), 8.41 (d, J = 1.9 Hz, 1H), 8.25 (d, J = 2.7 Hz, 1H), 8.08 (d, J = 7.8 Hz, 1H), 8.05 (d, J = 8.8 Hz, 1H), 7.93 (dd, J = 8.9, 2.8 Hz, 1H), 7.57 (dd, J = 8.7, 2.1 Hz, 1H), 7.49 (dt, J = 15.4, 8.2 Hz, 3H), 7.20 (ddd, J = 7.9, 6.9, 1.2 Hz, 1H), 4.40 (q, J = 7.2 Hz, 2H), 3.59 (s, 9H), 3.39 (t, J = 6.9 Hz, 2H), 3.05 (t, J =

6.9 Hz, 2H), 1.37 (t, J = 7.2 Hz, 3H); ¹³C NMR (101 MHz, CD₃CN): δ (ppm) = 181.1, 169.8, 167.4, 149.2, 141.3, 137.7, 134.1, 131.7, 131.6, 127.5, 126.8, 123.9, 123.4, 121.2, 121.0, 120.0, 119.5, 112.6, 109.9, 109.8, 58.1 (3C), 38.2, 33.2, 22.9, 14.0; HRMS (ESI+): m/z (%) = 546.1531/ 548.1436 (100/100) [M]⁺.

2-(9H-Carbazol-9-yl)ethanol (25)

Under N₂, 9H-carbazole (23, 5.43 g, 32.5 mmol, 1.0 eq.) was dissolved in THF (55 mL) and cooled down to -78°C. n-Butyllithium (1.2 M in n-hexane, 32.4 mL, 38.9 mmol, 1.2 eq.) was added dropwise, and the mixture was stirred for 30 min at -78°C. Then, a solution of ethylene sulfate (4.51 g, 36.3 mmol, 1.1 eq.) in THF (15 mL) was added, and the mixture was stirred for 1 h at -78°C and 24 h at rt. H₂O was added and the mixture was acidified to pH 1 with concentrated H₂SO₄and heated to reflux for 24 h. Afterwards, the solution was neutralized with 5 M NaOH, brine was added and the mixture was extracted with CH₂Cl₂. The organic layers were dried (Na₂SO₄) and concentrated under reduced pressure, and the residue was purified by fc (d = 8 cm, l = 12 cm, cyclohexane/EtOAc 65:35, $R_{\rm f}$ 0.42). Pale yellow solid, mp = 80°C, yield 4.66 g (68%). Purity (HPLC): 98.1% ($t_{\rm R}$ = 19.28 min). ¹H NMR (400 MHz, DMSO- d_6): δ (ppm) = 3.86 (quart, J = 5.9 Hz, 2H), 4.47 (t, J = 5.5 Hz, 2H), 4.99 (t, J = 5.0 Hz, 1H), 7.24 (t, J = 7.4 Hz, 2H), 7.48 (t, J = 7.6 Hz, 2H), 8.18 (d, J = 7.8 Hz, 2H); ¹³C NMR (CDCl₃): δ (ppm) = 45.3, 59.6, 109.6 (2C), 118.6 (2C), 120.2 (2C), 122.2 (2C), 125.0 (2C), 140.5 (2C); exact mass (APCI): m/z = calculated for C₁₄H₁₃NOH 212.1069, found 212.1060.

2-(3-Nitro-9H-carbazol-9-yl)ethanol (24)

9-(Hydroxyethyl)carbazole25 (5.11 g, 24.2 mmol, 1 eq.) was dissolved in CH₂Cl₂ (100 mL) and cooled down to 5°C to10°C. Concentrated nitric acid (density 1.5 g/mL, 1.7 mL, 36.3 mmol, 1.5 eq.) was added dropwise under vigorous stirring. Stirring was continued at <10°C until the starting material was transformed completely. H₂O (25 mL) was added and the reaction mixture was neutralized with NaHCO₃. Subsequently, brine was added and the mixture was extracted with CHCl₃. The organic layer was dried (Na₂SO₄) and concentrated under reduced pressure; the residue was supported on silica and purified by fc (d = 8 cm, l = 12 cm, cyclohexane/EtOAc 50:50, $R_{\rm f}$ 0.27). Pale yellow solid, mp = 230°C, yield 3.34 g (54%). ¹H NMR (CDCl₃): δ (ppm) = 4.13 (t, J = 5.3 Hz, 2H), 4.55 (t, J = 5,3 Hz, 2H), 7.38 (t, J = 8.0 Hz, 1H), 7.51 to 7.60 (m, 3H), 8.13 (d, J = 7.5 Hz, 1H), 8.39 (dd, J = 8.9/ 2.0 Hz, 1H), 9.03 (d, J = 2.2 Hz, 1H); ¹³C NMR (DMSO d_6): δ (ppm) = 39.4, 59.6, 110.2, 110.9, 117.3 (2C), 120.7, 121.3, 122.0, 122.3, 127.4, 139.9, 141.8, 144.1; exact mass (APCI): m/z = calculated for C₁₄H₁₂N₂O₃Na 279.0740, found 279.0740.

2-(3-Amino-9H-carbazol-9-yl)ethanol-hydrochloride (26-HCl) 3-Nitro-9-(hydroxyethyl)carbazole (24, 500 mg, 1.95 mmol, 1.0 eq.) was dissolved in THF (10 mL/100 mg) and Pd/C (100 mg) was added. The reaction mixture was stirred for 24 h at rt under H₂ (balloon). The catalyst was removed by filtration over Celite° and the filtrate was concentrated under reduced pressure. The residue was dissolved in diethyl ether. Under N2, HCl-Et2O (2 mol/L, 2 mL, 4 mmol, 2.0 eq.) was added drop wise under vigorous stirring to produce the respective HCl salt. The precipitate was filtered, washed with cold MeOH, and used without further purification. $R_f 0.35$ (cyclohexane/ethyl acetate 30:70). Colorless solid with mp = 230° C, yield 492 mg (96%). ¹H NMR (**26**-HCl, DMSO- d_6): δ (ppm) = 3.78 (t, J = 5.5 Hz, 2H), 4.47 (t, J = 5.5 Hz, 2H), 7.24 (t, J = 7.4 Hz, 7.4 Hz)1H), 7.45 (dd, J = 8.7/2.1 Hz, 1H), 7.50 (t, J = 7,7 Hz, 1H), 7.66 (d, J = 8.3 Hz, 1H), 7.74 (d, J = 8.7 Hz, 1H), 8.12 (d, J = 2.1 Hz, 1H), 8.18 (d, J = 7.7 Hz, 1H), 10.4 (s, 3H); ¹³C NMR (**26**-HCl, DMSO- d_6): δ (ppm) = 45.5, 59.7, 110.2, 110.8, 114.8, 119.3, 120.6, 121.5, 122.3, 122.8, 126.7 (2C), 139.7, 141.2; exact mass (APCI): m/z = calculated for C₁₄H₁₅N₂O 217.1179, found 217.1179.

3-[3-(2-Bromo-4-fluorophenyl)-1,2,4-oxadiazol-5-yl]-N-[9-(2-hydroxyethyl)-9H-carbazol-3-yl]propanamide (14)

Compound 10 (400 mg, 1.3 mmol 1 eq.) was treated with COMU° (652 mg, 1.5 mmol 1.2 eq.) and triethylamine (0.54 mL, 3.9 mmol, 3.3 eq.) in DMF (15 mL) for 30 min at rt. The reaction mixture was cooled down to 0°C, and a solution of the 3-aminocarbazole hydrochloride 26 (222 mg, 0.9 mmol, 1.0 eq.) in DMF was added dropwise. The mixture was stirred for 24 h at <10°C. Then, H_2O and brine were added, the mixture was extracted with CHCl₃, the combined organic layers were dried (Na₂SO₄) and concentrated in vacuo, and the residue was purified by fc $(d = 5 \text{ cm}, l = 15 \text{ cm}, \text{ cyclohexane/EtOAc} 15:85, R_{f} 0.51$ (EtOAc)). Colorless solid, mp = 164°C, yield 368 mg (80%). Purity (HPLC), 97.7% ($t_{\rm R}$ = 20.24 min). ¹H NMR (DMSO- d_6): δ (ppm) = 2.99 (t, J = 7.0 Hz, 2H), 3.35 (t, J = 7.1 Hz, 2H), 3.76 (q, J = 5.6 Hz, 2H), 4.40 (t, J = 5.5Hz, 2H), 4.86 (t, J = 5.4 Hz, 1H), 7.15 (t, J = 7.4 Hz, 1H), 7.41 (t, J = 6.5 Hz, 1H), 7.46 (td, J = 8.5/2.6 Hz, 1H), 7.51 (dd, J = 8.8/1.7 Hz, 1H), 7.54 (d, J = 8.8Hz, 1H,), 7.57 (d, J = 8.3 Hz, 1H), 7.83 (dd, J =8.6/2.6 Hz, 1H), 7.89 (dd, J = 8.7/6.1 Hz, 1H), 8.02 (d, J = 7.8 Hz, 1H), 8.39 (s, 1H), 10.13 (s, 1H); ¹³C NMR $(DMSO-d_6): \delta$ (ppm) = 21, 32.0, 45.3, 59.6, 109.5, 109.7, 110.9, 115.5 (d, J = 21.6 Hz,1C), 118.5, 118.7, 120.0, 121.4 (d, J = 24.9 Hz, 1C), 121.7, 122.0, 122.2 (d, J = 10.1 Hz, 1C), 124.5 (d, J = 3.4 Hz, 1C), 125.6, 131.0,133.6 (d, J = 9.3 Hz, 1C), 137.0, 140.9, 162.9 (d, J = 253.4 Hz, 1C), 166.4, 168.5, 179.6; exact mass (ESI): m/z = calculated for C₂₅H₂₀⁷⁹BrFN₄O₃H 523.0776, found 523.0783.

3-[3-(2-Bromo-4-fluorophenyl)-1,2,4-oxadiazol-5-yl]-N-(**9-ethyl-9H-carbazol-3-yl)propanamide** (**2**) The synthesis of **2** is described in [29].

3-[3-(2-Bromo-4-fluorophenyl)-1,2,4-oxadiazol-5-yl]-N-[9-(2-fluoroethyl)-9H-carbazol-3-yl]propanamide (1)

Under N₂, XtalFluor-E[°] (263 mg, 1.2 mmol, 1.5 eq.) was suspended in CH₂Cl₂ (15 mL). Triethylamine trihydrofluoride (NEt₃-3HF) (0.2 mL, 1.2 mmol, 1.5 eq.) and a solution of 14 (400 mg, 0.8 mmol, 1 eq.) in CH₂Cl₂ (20 mL) were added to the suspension via cannula at -78°C. The resulting mixture was warmed up to rt within 3 h. An aqueous solution of Na₂CO₃ (5% m/m) was added, and the reaction mixture was stirred for 15 min at rt. After the addition of brine, the mixture was extracted with CH₂Cl₂, the organic layer was dried (Na₂SO₄) and concentrated *in vacuo*, and the residue was purified by fc (d = 6 cm, l = 15 cm, cyclohexane/EtOAc 20:80, $R_{\rm f} = 0.53$ (EtOAc)). The product (1) was recrystallized from ethyl acetate yielding 82 mg of colorless solid (yield 20%) with mp of 201°C. Purity (HPLC), 96.7% ($t_{\rm R}$ = 21.46 min). ¹H NMR $(CDCl_3): \delta$ (ppm) = 2.97 (t, J = 7.0 Hz, 2H), 3.39 (t, J = 7.0 Hz, 2H), 4.51 (dt, J = 24.2/5.1 Hz, 2H), 4.72 (dt, J =46.8/5.1 Hz, 2H), 7.03 to 7.09 (m, 1H), 7.16 (t, J = 7.0 Hz, 1H), 7.27 (d, J = 8.6 Hz, 1H), 7.32 (d, J = 8.2 Hz, 2H), 7.36 to 7.43 (m, 3H), 7.56 (s, 1H), 7.76 (dd, J = 8.7/6.0 Hz, 1H), 7.97 (d, J = 7.8 Hz, 1H), 8.41 (d, J = 1.8 Hz); ¹³C NMR $(DMSO-d_6): \delta$ (ppm) = 21.8, 32.0, 42.9 (d, J = 19.7 Hz), 82.6 (d, J = 167.9 Hz), 109.5, 109.6, 110.9, 115.5 (d, J = 21.7 Hz), 118.8, 118.9, 120.0, 121.4 (d, J = 25.1 Hz), 121.9, 122.1, 122.2 (d, J = 9.9 Hz), 124.5 (d, J = 3.4 Hz), 125.8, 131.4, 133.6 (d, J = 9.3 Hz), 136.7, 140.6, 162.9 (d, J = 253.2 Hz), 166.4, 168.5, 179.6; HRMS (APCI): *m*/*z* = calculated for $C_{25}H_{19}^{-79}BrF_2N_4O_2H$ 525.0732, found 525.0757.

[2-(3-{3-[3-(2-Bromo-4-fluorophenyl)-1,2,4-oxadiazol-5-yl] propanamido}-9H-carbazol-9-yl)ethyl] 4-methylbenzenesulfonate (15)

Under N₂, compound 14 (250 mg, 0.5 mmol, 1 eq.), 4dimethylaminopyridine (17.5 mg, 0.15 mmol, 0.3 eq.), and triethylamine (0.25 mL, 1.8 mmol, 3.6 eq.) were dissolved in THF (20 mL) and cooled down to 0°C. A solution of *p*-toluenesulfonyl chloride (183 mg, 1.0 mmol, 2 eq.) in THF (10 mL) was added dropwise. After 20 min, the mixture was warmed up to rt and stirred for 48 h. Subsequently, 1 M aq. NaOH (3 mL) was added and the layers were separated. The aqueous layer was extracted with CH₂Cl₂ and the organic layer was washed with brine. The combined organic layers were dried (Na₂SO₄) and concentrated in vacuo, and the residue was purified by fc (d = 5 cm, l = 10 cm, cyclohexane/ EtOAc 40:60, $R_{\rm f} = 0.34$ (cyclohexane/EtOAc 50:50)). The product (15) was recrystallized from CH_2Cl_2 yielding 197 mg (colorless solid, mp = 136°C, yield 61%). Purity

(HPLC), 96.2% ($t_R = 22.85 \text{ min}$). ¹H NMR (CDCl₃): δ (ppm) = 2.24 (s, 3H), 3.04 (t, J = 7.0 Hz, 2H), 3.47 (t, J = 7.0 Hz, 2H), 4.38 (t, J = 5.4 Hz, 2H), 4.49(t, J = 5.3 Hz, 2H), 6.85 (d, J = 8.0 Hz, 2H), 7.15 (t, J = 7.4Hz, 1H), 7.17 to 7.23 (m, 5H), 7.33 (dd, J = 8.7/1.9 Hz, 1H), 7.39 (t, J = 8.1 Hz, 1H), 7.46 (dd, J = 8.2/2.4 Hz, 1H), 7.74 (s, 1H), 7.83 (dd, J = 8.7/6.0 Hz, 1H), 7.94 (d, J = 7.8 Hz, 1H), 8.31 (d, J = 1.7 Hz, 1H); ¹³C NMR (DMSO- d_6): δ (ppm) = 21.0, 21.8, 32.0, 41.3, 68.8, 109.2, 109.3, 110.8, 115.5 (d, J = 21.1 Hz, 1C), 118.5, 118.8, 119.9, 121.4 (d, J = 24.9 Hz, 1C), 122.0, 122.1 (d, J = 9.9 Hz, 1C), 122.2, 124.5 (d, J = 3.3 Hz, 1C), 125.7, 126.6 (2C), 129.5 (2C), 131.0, 131.3, 133.6 (d, J = 9.2 Hz, 1C), 136.3, 140.3, 144.4, 162.9 (d, J = 253.5 Hz, 1C), 166.6, 168.5, 179.7; HRMS (APCI): m/z = calculated for C₃₂H⁷⁹₂₆BrFN₄O₅SH 677.0864, found 677.0858.

Methyl-3-(3-(2-bromo-4-nitrophenyl)-1,2,4-oxadiazol-5-yl) propanoate (21)

At -10° C, SOCl₂ (71 µL, 0.77 mmol, 3.3 eq.) was dissolved in 0.5 mL MeOH and stirred for 10 min. Acid **9** (100 mg, 0.29 mmol, 1 eq.) was then added and the reaction was allowed to reach room temperature within 1 h. The reaction was stirred further for 1 h at rt and quenched by the addition of 5 mL saturated aq. NaHCO₃ solution, and the product was extracted with EtOAc (three times with 5 mL). Evaporation of the solvent afforded **21** in a quantitative manner (104 mg, 0.29 mmol). ¹H NMR (400 MHz, CDCl₃): δ (ppm) = 8.59 (d, *J* = 2.2 Hz, 1H), 8.26 (dd, *J* = 8.6, 2.2 Hz, 1H), 8.06 (d, *J* = 8.6 Hz, 1H), 3.73 (s, 3H), 3.32 (t, *J* = 7.2 Hz, 2H), 2.97 (t, *J* = 7.2 Hz, 2H); ¹³C NMR (100 MHz, CDCl₃): δ (ppm) = 178.8, 171.6, 166.7, 149.0, 134.1, 132.8, 129.4, 122.8, 122.2, 52.3, 30.2, 22.1; MS (ESI+): *m/z* (%) = 356/358 (100/100) [M+H]⁺.

Methyl-3-(3-(4-amino-2-bromophenyl)-1,2,4-oxadiazol-5-yl) propanoate (16)

To a solution of **21** (50 mg, 0.13 mmol, 1 eq.) in 2 mL EtOH, SnCl₂-2H₂O (149 mg, 0.66 mmol, 5 eq.) was added and the reaction was stirred for 2 h at rt. Saturated aq. NaHCO₃ solution (5 mL) was added, and the mixture was extracted with EtOAc. The organic phase was dried over sodium sulfate and filtered. Upon solvent evaporation under reduced pressure, amine **16** was obtained as a brown solid (45 mg, 0.13 mmol, quant). ¹H NMR (400 MHz, DMSO-*d*₆): δ (ppm) = 7.45 (d, *J* = 8.5 Hz, 1H), 6.92 (d, *J* = 2.2 Hz, 1H), 6.64 (dd, *J* = 8.5, 2.2 Hz, 1H), 3.55 (s, 4H), 3.13 (dd, *J* = 7.6, 5.9 Hz, 2H), 2.93 – 2.74 (m, 2H); ¹³C NMR (100 MHz, DMSO-*d*₆): δ (ppm) = 178.6, 172.8, 167.7, 152.5, 133.2, 122.4, 118.7, 114.1, 113.6, 52.4, 30.2, 22.0; MS (ESI+): *m*/*z* (%) = 348/ 350 (100/100) [M+Na]⁺.

Methyl-3-(3-(2-bromo-4-(dimethylamino)phenyl)-1,2,4oxadiazol-5-yl)propanoate (22)

Compound **22** was synthesized as described for **20** from **16** in 52% yield as a brown solid. ¹H NMR (300 MHz, CDCl₃): δ (ppm) = 7.75 (d, *J* = 8.8 Hz, 1H), 7.00 (d, *J* = 2.6 Hz, 1H), 6.70 (dd, *J* = 8.9, 2.6 Hz, 1H), 3.72 (s, 3H), 3.25 (t, *J* = 7.4 Hz, 2H), 3.01 (s, 6H), 2.93 (t, *J* = 7.4 Hz, 2H); ¹³C NMR (75 MHz, CDCl₃): δ (ppm) = 177.2, 171.9, 168.0, 152.0, 132.7, 123.1, 117.2, 115.2, 111.0, 52.3 (2C), 40.4, 30.5, 22.2; MS (ESI+): *m*/*z* (%) = 360/362 (100/100) [M+Na]⁺.

3-Bromo-4-(5-(3-methoxy-3-oxopropyl)-1,2,4-oxadiazol-3-yl)-N,N,N-trimethylbenzenaminium iodide (18)

Compound **18** was synthesized as described for **13** from **22** in 90% yield as a brown solid (mp = 119°C). ¹H NMR (300 MHz, CD₃CN): δ (ppm) = 8.29 (d, *J* = 2.6 Hz, 1H), 8.04 (d, *J* = 8.8 Hz, 1H), 7.98 (dd, *J* = 8.9, 2.7 Hz, 1H), 3.68 (s, 3H), 3.63 (s, 9H), 3.29 (t, *J* = 6.9 Hz, 2H), 2.94 (t, *J* = 6.9 Hz, 2H); ¹³C NMR (75 MHz, CD₃CN): δ (ppm) = 181.1, 173.4, 168.0, 134.7, 132.1, 128.2, 124.4, 121.8, 118.8, 58.8 (3C), 53.1, 31.3, 23.3; HRMS (ESI+): *m*/*z* (%) = 368.0616/370.0615 (100/100) [M]⁺.

Methyl-3-(3-(2-bromo-4-fluorophenyl)-1,2,4-oxadiazol-5-yl) propanoate (17)

Compound 17 was synthesized as described for **21** from **10** in a quantitative manner as a colorless solid (mp = 39°C). ¹H NMR (400 MHz, CDCl₃): δ (ppm) = 7.84 (dd, J = 8.7, 6.0 Hz, 1H), 7.47 (dd, J = 8.3, 2.5 Hz, 1H), 7.14 (ddd, J = 8.7, 7.7, 2.6 Hz, 1H), 3.73 (s, 3H), 3.29 (t, J = 7.3 Hz, 2H), 2.94 (t, J = 7.3 Hz, 2H); ¹³C NMR (100 MHz, CDCl₃): δ (ppm) = 178.1, 171.7, 167.3, 164.7, 162.2, 133.4 (d, J = 9.1 Hz), 122.9 (d, J = 9.9 Hz), 121.7 (d, J = 24.7 Hz), 115.0 (d, J = 21.4 Hz), 52.2, 30.3, 22.1; ¹⁹ F NMR (376 MHz, CDCl₃): δ (ppm) = -108.0 (dd, J = 14.1, 7.9 Hz); MS (ESI+): m/z (%) = 351/353 (100/100) [M+Na]⁺.

Radiochemistry

No-carrier-added [¹⁸F]fluoride ($t_{1/2} = 109.8$ min) was produced via the [¹⁸O(p,n)¹⁸F] nuclear reaction by irradiation of a [¹⁸O]H₂O target (Hyox 18 enriched water, Rotem Industries Ltd, Israel) on a Cyclone°18/9 (iba RadioPharma Solutions, Belgium) with a fixed energy proton beam using Nirta° [¹⁸F]fluoride XL target. Aqueous [¹⁸F]fluoride was dried by azeotropic distillation using MeCN in the presence of K₂CO₃ (1.78 mg, 12.9 mmol) and Kryptofix 2.2.2 (K_{2.2.2}, 11.2 mg, 29.7 mmol), resulting in the reactive anhydrous K[¹⁸F]F-K_{2.2.2}-carbonate complex. Optimization of the aliphatic and aromatic radiolabellings of tosylate **15** and trimethylammonium salt **13**, respectively, were performed by varying the amount of precursor for radiolabelling and reaction time under thermal heating

(82°C) in MeCN (Scheme 1). Under optimized conditions, the reaction mixtures of $[{}^{18}F]\mathbf{1}$ and $[{}^{18}F]\mathbf{2}$ were diluted with water and directly applied to an isocratic semi-preparative RP-HPLC for isolation of the desired radiotracers (see 'Experimental' section). The collected fractions were analyzed by radio-TLC, and those with the highest radiochemical purity were combined, diluted with water, passed through a Sep-Pak C18 light cartridge (Waters, Milford, MA, USA), and eluted with 0.6 mL of diethyl ether (DEE). The elution of $[^{18}F]\mathbf{1}$ and [¹⁸F]**2** was performed in polypropylene vials containing 75 to 100 µL of EtOH. For biological investigations, the solvent was evaporated to dryness under a gentle argon stream, and the desired radiotracers were formulated in a sterile isotonic solution containing 10% EtOH (ν/ν). The identities of $[^{18}F]\mathbf{1}$ and $[^{18}F]\mathbf{2}$ were verified by radio-HPLC of samples of the respective radiotracer spiked with the non-radioactive reference compound. Radiochemical and chemical purities were assessed by radio-TLC and analytical HPLC. Specific activities were calculated using the HPLC method described in [43]. For evaluation of radiometabolites, the radiosynthesis of the trimethylammonium salt **18** to afford $[^{18}F]$ **17** was performed following the same conditions as above stated for $[^{18}F]\mathbf{1}$ and $[^{18}F]\mathbf{2}$ (Scheme 5).

Determination of lipophilicity (logD) and stability

The distribution coefficients of $[^{18}F]\mathbf{1}$ and $[^{18}F]\mathbf{2}$ were also calculated from RP-HPLC retention times in three different systems: (1) isocratic elution (60% MeCN/20 mM NH₄OAc at a flow rate of 1 mL/min) and (2) gradient elution (starting from 10% MeCN/20 mM NH₄OAc aq. for 10 min with a gradient to 90% MeCN/20 mM NH₄OAc aq. over 30 min at a flow rate of 1 mL/min) on a Reprosil-Pur C18-AQ column (5 µm, 250 × 4.6 mm, Dr. Maisch HPLC GmbH, Ammerbruch-Entringen, Germany), and (3) isocratic elution (52.5% MeCN/20 mM NH₄OAc at a flow rate of 1 mL/min) on a Prodigy 5 µm C8 (250 × 4 mm; Phenomenex Ltd, Aschaffenburg, Germany) using the reference compounds following the protocol according to the EU guideline 67/548/ EWG [44].

In vitro radiochemical stabilities of [¹⁸F]**1** and [¹⁸F]**2** were investigated in 0.9% NaCl solution, Dulbecco's phosphate buffer, 0.01 M Tris–HCl (pH 7.4 at 21°C), and EtOH at 40°C for 90 min. Samples were taken at 15, 30, 60, and 90 min after incubation and analyzed by radio-TLC and radio-HPLC.

In vitro CB receptor affinity assay

For binding experiments, Chinese hamster ovary (CHO) cell lines stably transfected with human CB_1R human and CB_2R were used according to the procedures previously described [29]. Briefly, displacement of $CB_1R/$

CB₂R-specific radioligand [³H]CP55,940 (6,438 GBq/ mmol; PerkinElmer Life and Analytical Sciences GmbH, Rodgau, Germany; working concentration, 0.2 to 0.5 nM) by test compounds in the range of 0.1 nM to 10 μ was assessed, and IC₅₀ values were estimated by non-linear regression (GraphPad Prism; version 3.0, GraphPad Software, Inc., San Diego, CA, USA). K_D values of 2.4 and 1.5 nM were previously determined for [³H]CP55,940 binding to hCB₁R and hCB₂R, respectively, and used for calculation of K_i values of the test compounds according to Cheng et al. [45]. The binding experiments were performed in triplicates, and data were given as mean values from independent experiments.

Ex vivo biodistribution studies

Animals for *in vivo* studies were obtained from the Medizinisch-Experimentelles Zentrum, Universität Leipzig. All procedures that include animals were approved by the respective State Animal Care and Use Committee and conducted in accordance with the German Law for the Protection of Animal.

Female CD1 mice (10 to 12 weeks old, 20 to 25 g) received an injection of 300 to 400 kBq of [¹⁸F]**1** or [¹⁸F]**2** with specific activities of >450 GBq/µmol in 200 µL of 0.9% NaCl/10% EtOH into the tail vein. The animals were anesthetized (CO₂/O₂ mixture) for blood and urine sampling and euthanized by luxation of the cervical spine at 5, 30, and 60 min after injection (p.i.) (n = 2 to 5 per time). The organs of interest were removed and weighed, and the activities were measured by γ counting using a calibrated γ counter Wallac Wizard 1470 (Perkin Elmer Inc., Waltham, MA, USA). The percentage of injected dose per gram of wet tissue (% ID/g wet weight) was calculated.

To verify the specificity of $[{}^{18}F]\mathbf{1}$ and $[{}^{18}F]\mathbf{2}$ towards CB₂R, blocking experiments were performed with preadministration of the highly selective CB₂R inverse agonist SR144528 [46] (3 mg/kg i.p. in 0.9% saline, 10 min before the injection of the radiotracer) at 60 min p.i. (n = 2 to 5). The unpaired two-tailed t test was used to compare the results between the groups. We considered differences to be significant at a p value <0.05.

Ex vivo metabolite studies

 $[^{18}$ F]**1** and $[^{18}$ F]**2** (100 to 150 MBq, 250 to 450 GBq/μmol in 150 μL NaCl 0.9%/10% EtOH) were injected via the tail vein in CD1 male mice (10 to 12 weeks old, 20 to 25 g). Blood and urine samples were obtained at 30 and 60 min p.i. (*n* = 3 per time point). Twofold extractions of plasma and brain samples (*n* = 3) were performed using ice-cold MeCN according to the standard protocol established in our group (see [47,48]). Briefly, plasma samples were obtained by centrifugation of the blood at 4,000×*g* at 4°C for 10 min, and brain samples were homogenized in ice-cold 50 mM Tris-HCl (pH = 7.4). The samples were vortexed, incubated on ice, and centrifuged at 10,000×g for 3 min. Supernatants were collected, and the precipitates were re-dissolved in ice-cold MeCN for the second extraction. The supernatants from the two extractions were combined, concentrated under a gentle argon stream at 65°C, and analyzed by radio-TLC and gradient analytical HPLC (see 'Radiochemistry' section). Aliquots from each extraction supernatant and the precipitates were also taken and quantified by γ counting (Wallac Wizard 1470, Perkin Elmer Inc., Waltham, MA, USA) along with the respective aliquots of intact plasma samples and brain homogenates. A moderate recovery of radioactivity was obtained from plasma samples and brain homogenates (60% to 70%). Radiometabolites of ¹⁸F]17 in the plasma, spleen, and brain were assessed at 30 and 60 min p.i.

Conclusions

In conclusion, *N*-aryl-oxadiazolyl-propionamides were successfully radiolabelled with ¹⁸F at different positions. Fluorine substitution at these positions did not affect affinity and specificity towards CB_2R . However, the radiotracers investigated in this study undergo a fast metabolism *in vivo* with the main radiometabolites crossing the blood–brain barrier. Therefore, structural changes in the enzymatic cleavage sites of the evaluated candidates have to be performed to enhance their potential as CB₂R PET imaging agents for the brain.

Additional file

Additional file 1: Supplemental information. In the additional file, data of the blocking studies (% blocking, *p* values) are compiled.
