**eFigure 1.** Study design diagram and definition of the cohort

**eTable 2.** Definitions of inclusion and exclusion criteria

**eTable 3.** Outcome definitions

**eTable 4.** Baseline characteristics of patients with HbA<sub>1c</sub> < 7.5% initiating SGLT2 inhibitor vs. DPP4 inhibitor therapy before and after 1:1 PS-matching

**eTable 5.** Baseline characteristics of patients with HbA<sub>1c</sub> between 7.5% and 9% initiating SGLT2 inhibitor vs. DPP4 inhibitor therapy before and after 1:1 PS-matching

**eTable 6.** Baseline characteristics of patients with HbA<sub>1c</sub> > 9% initiating SGLT2 inhibitor vs. DPP4 inhibitor therapy before and after 1:1 PS-matching

**eFigure 2.** Propensity score distributions of SGLT2i and DPP4i initiators in the overall population.

**eTable 7.** Follow-up and censoring reasons after PS-matching (primary outcomes)

**eFigure 3.** Cumulative incidence of modified MACE and HHF comparing 1:1 propensity score-matched patients initiating SGLT2 inhibitor vs. DPP-4 inhibitor therapy stratified by HbA<sub>1c</sub> levels.

**eTable 8.** Time-limited “intent-to-treat” analysis and secondary analyses of the primary effectiveness outcomes in 1:1 propensity score-matched patients initiating SGLT2 inhibitor vs. DPP-4 inhibitor therapy and stratified by HbA<sub>1c</sub> levels

**eTable 9.** Number of events, incidence rates, relative and absolute estimates for sensitivity analysis of incident safety outcomes in 1:1 PS-matched initiators of SGLT2 inhibitor vs. DPP4 inhibitor therapy

This supplemental material has been provided by the authors to give readers additional information about their work.

## eMethods

### Feasibility Analyses

Before conducting the main effectiveness and safety analyses, we performed a feasibility analysis comparing baseline characteristics of eligible patients with vs. without an HbA1c value recorded within 3 months before cohort entry. The aim was to investigate whether patients with HbA1c value in the de-identified Optum® Clininformatics® Data Mart Database were representative of the full insured population by sharing similar baseline characteristics of those without an HbA1c value. Balance of baseline characteristics between the two sub-populations was assessed with standardized differences, with meaningful imbalances set at values higher than 10% (see eTable 1).

### Sensitivity Analyses

We inspected the robustness of the main findings through sensitivity analyses. We explored potential informative censoring by carrying forward the exposure to the first-used medication for one year from cohort entry, without considering drug discontinuation or switching, i.e., mimicking an “intention-to-treat” approach. To assess consistency of treatment effect across subgroups of patients with and without history of cardiovascular disease (defined as a diagnosis of MI, angina, coronary atherosclerosis or other forms of chronic ischemic heart disease, coronary procedure, congestive heart failure, ischemic stroke, peripheral artery disease or surgery, recorded within six months before cohort entry), we tested the significance of an interaction term between exposure and cardiovascular disease history in our primary effectiveness outcome models. Our primary cohort included users of insulin, which is generally prescribed in routine care as treatment intensification (or third-line therapy) in patients with T2D at an advanced stage. Comparisons involving both second-line therapies (SGLT2i and DPP-4i) and a third-line therapy (insulin) may introduce time-lag bias, as insulin users can have a more severe diabetes. This bias is compounded by the fact that the insulin users had already started insulin before cohort entry, unlike the new users of SGLT2i or DPP-4i. To address potential time-lag bias and thus test the internal validity of the primary effectiveness findings, we excluded from the original cohort patients on insulin and required patients to receive metformin at cohort entry. Additionally, as CVOTs showed an increased HHF rate in patients receiving saxagliptin or alogliptin compared to placebo, which resulted in an FDA warning, we conducted a sensitivity analysis for the HHF outcome redefining the comparator group as sitagliptin only, which had a neutral effect on HHF in CVOTs. Finally, to address the potential for unmeasured confounding associated with the high risk for recurrence for certain safety outcomes, we excluded from the original study population patients with a recent history of fracture of the pelvis, hip, humerus, radius and ulna, genital mycotic infection and DKA events at baseline. All secondary cohorts built for the sensitivity analyses were stratified by HbA1c levels and within each HbA1c stratum, PS was re-estimated and matching re-performed. The definitions of the secondary cohorts are reported in eTable 2.

**eTable 1.** Baseline characteristics of eligible patients with vs. without a HbA<sub>1c</sub> value within 3 months before cohort entry.

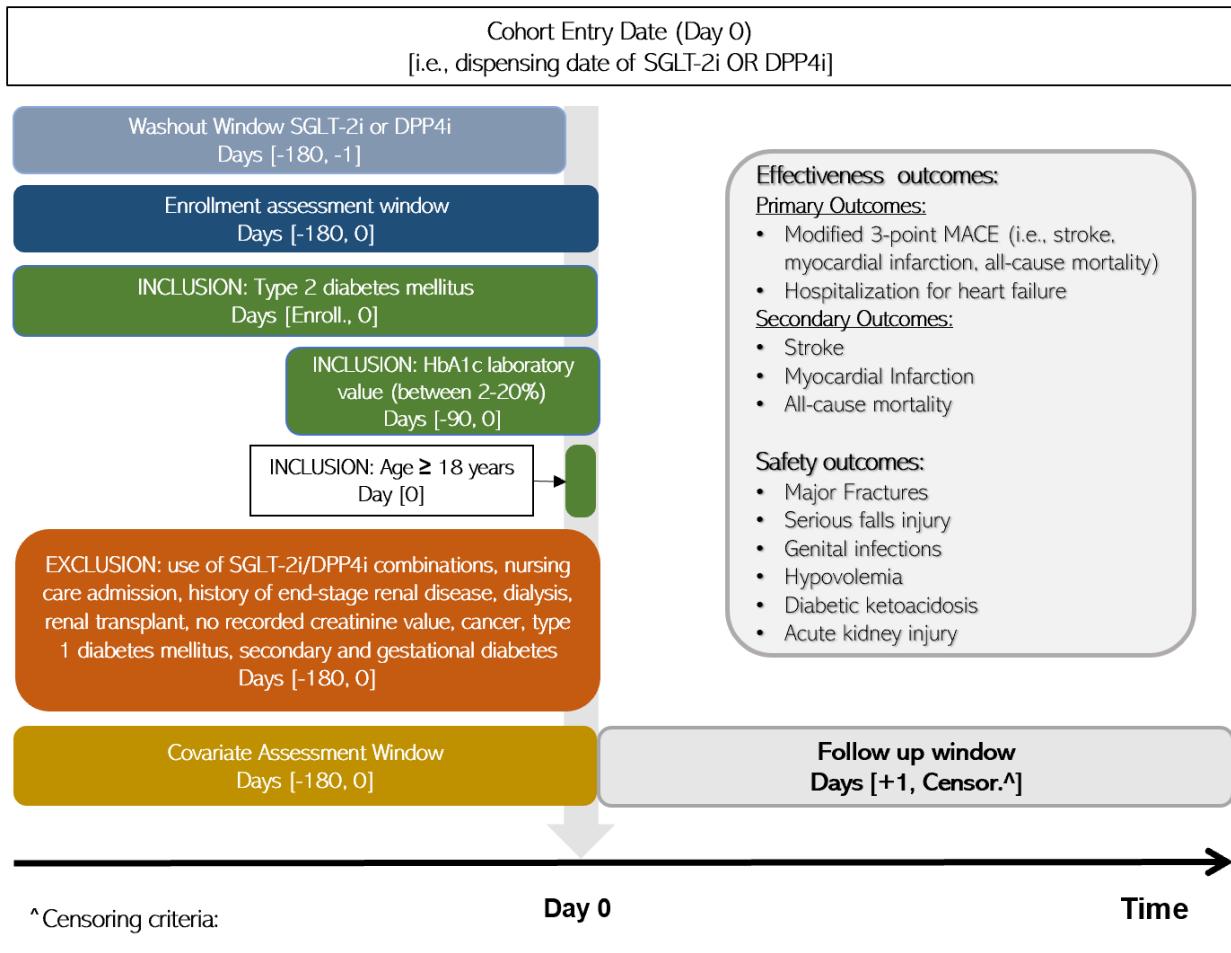

|  | Patients without HbA1c | Patients with HbA1c | St. Diff. |

Abbreviations. St. Diff., standardized difference; SD, standard deviation; GLP-1 RA, Glucagon-like peptide-1 receptor agonists; MI, myocardial infarction; TIA, transient ischemic attack; peripheral artery disease; NASH/NAFLD, Nonalcoholic steatohepatitis/Nonalcoholic fatty liver disease; COPD, chronic obstructive pulmonary disease; CKD, chronic kidney disease; ARBs, Angiotensin II Receptor Blockers; ACEis, Angiotensin Converting Enzyme inhibitors; MRA, mineralocorticoid receptor antagonist; PCSK9, Proprotein convertase subtilisin/kexin type 9; NSAIDs, nonsteroidal anti-inflammatory drugs; MRI, magnetic resonance imaging; DRE, digital rectal examination; PSA, prostate-specific antigen; ED, emergency department, LOS, length of stay; ECG, electrocardiogram; eGFR, estimated glomerular filtration rate; uACR, urine albumin-creatinine ratio; LDL, low-density lipoprotein; HDL, high-density lipoprotein.

**eFigure 2.** Propensity score distributions of SGLT2i and DPP4i initiators in the overall population.

**Legend** E = SGLT2 inhibitors; R = DPP4 inhibitors.

**Caption** The figure displays the propensity score distribution overlap prior to (A) and after (B) matching. In both graphs (A and B), the x-axis shows the range of propensity scores (0 to 1), and the y-axis shows the density of patients. Patients in the DPP4i group (blue) have lower propensity scores, while those in the SGLT2i group (green) have higher propensity scores (A). The overlapped proportion of patients in B is included in the propensity score matched analysis.

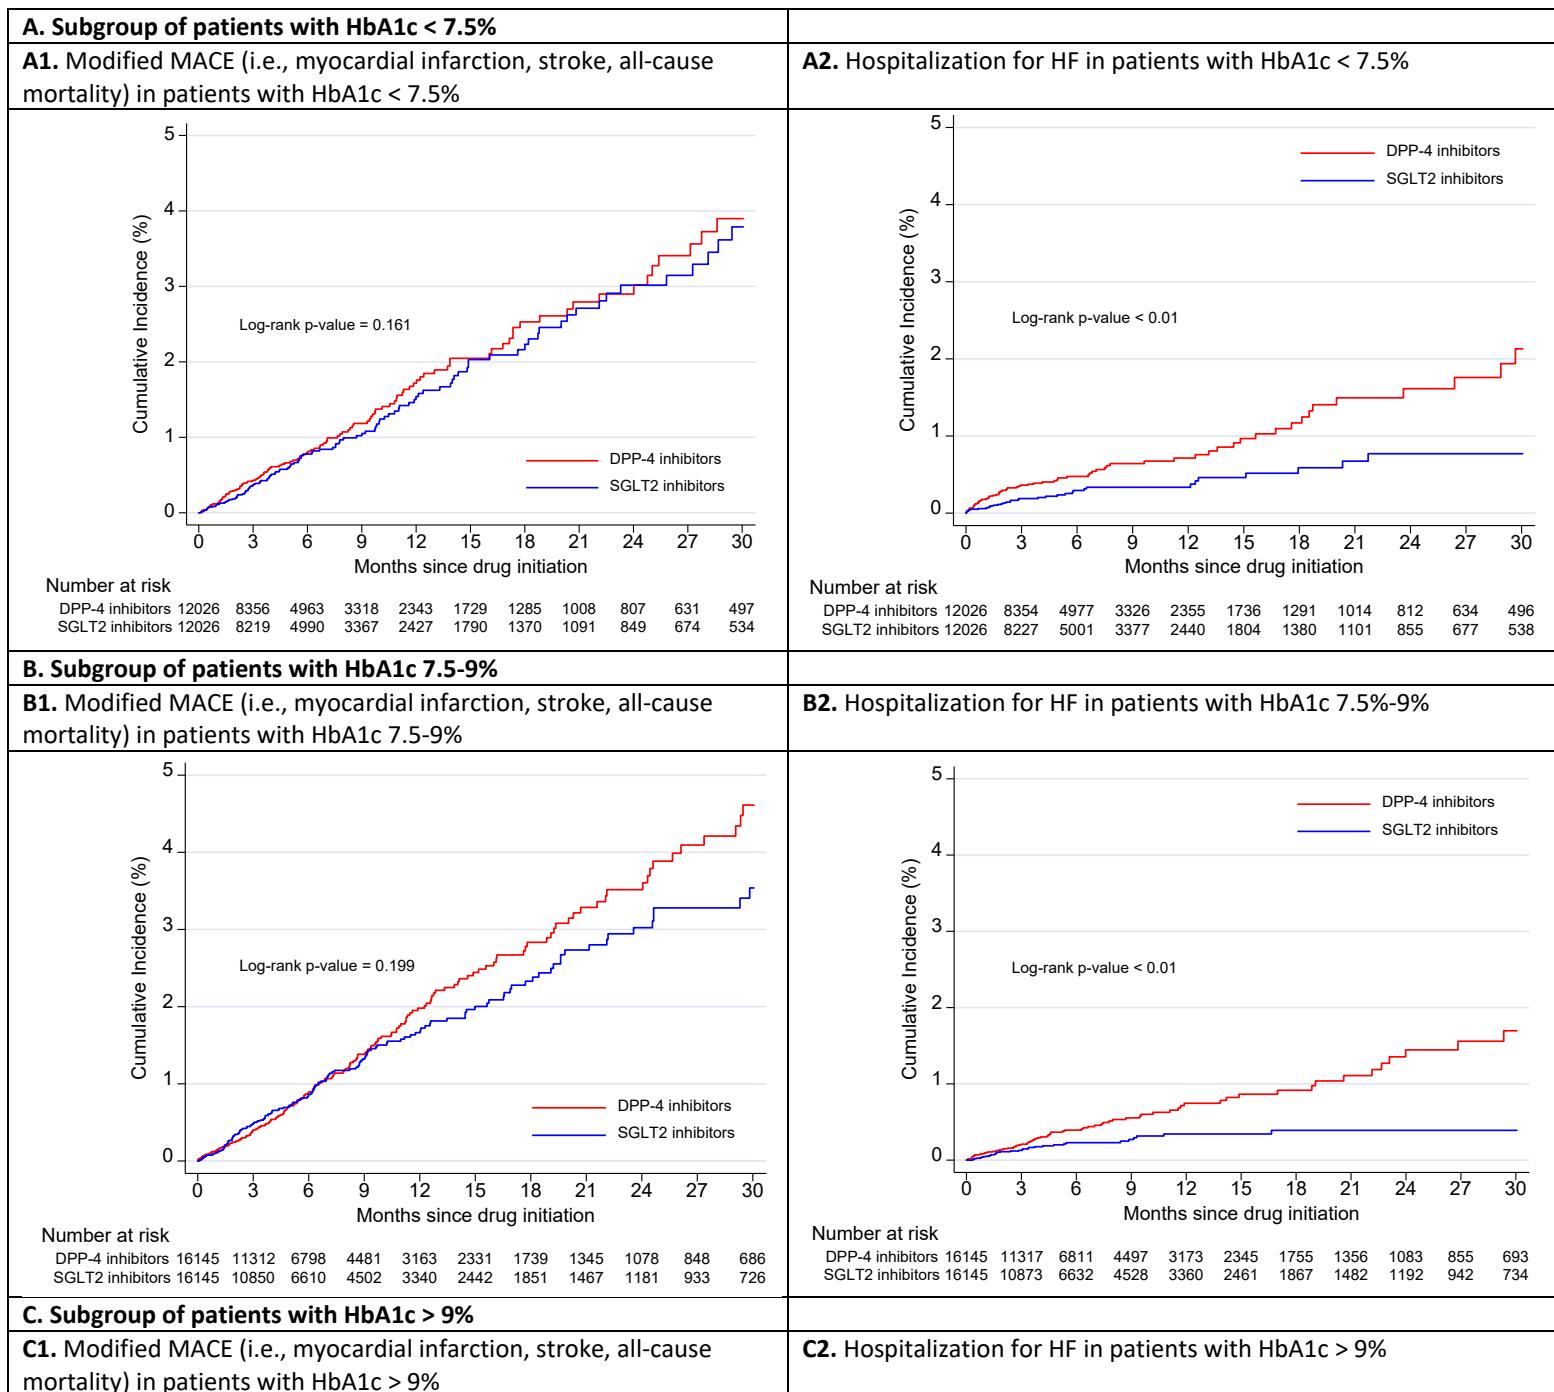

**eTable 7.** Follow-up and censoring reasons after PS-matching (primary outcomes)

Abbreviations: MACE, major adverse cardiovascular events; IQR, interquartile range; SD, standard deviation; HbA1c, HbA1c, glycated hemoglobin; DPP-4, dipeptidyl peptidase 4; SGLT2, Sodium-Glucose Cotransporter-2. Follow-up and censoring are strictly dependent on the outcome of interest. The table reports follow-up and censoring information specific to the primary outcomes.

Follow-up and censoring reasons specific to secondary outcomes may include minor variations.

**eFigure 3.** Cumulative incidence of modified MACE and HHF comparing 1:1 propensity score–matched patients initiating SGLT2 inhibitor vs. DPP-4 inhibitor therapy stratified by HbA<sub>1c</sub> levels.

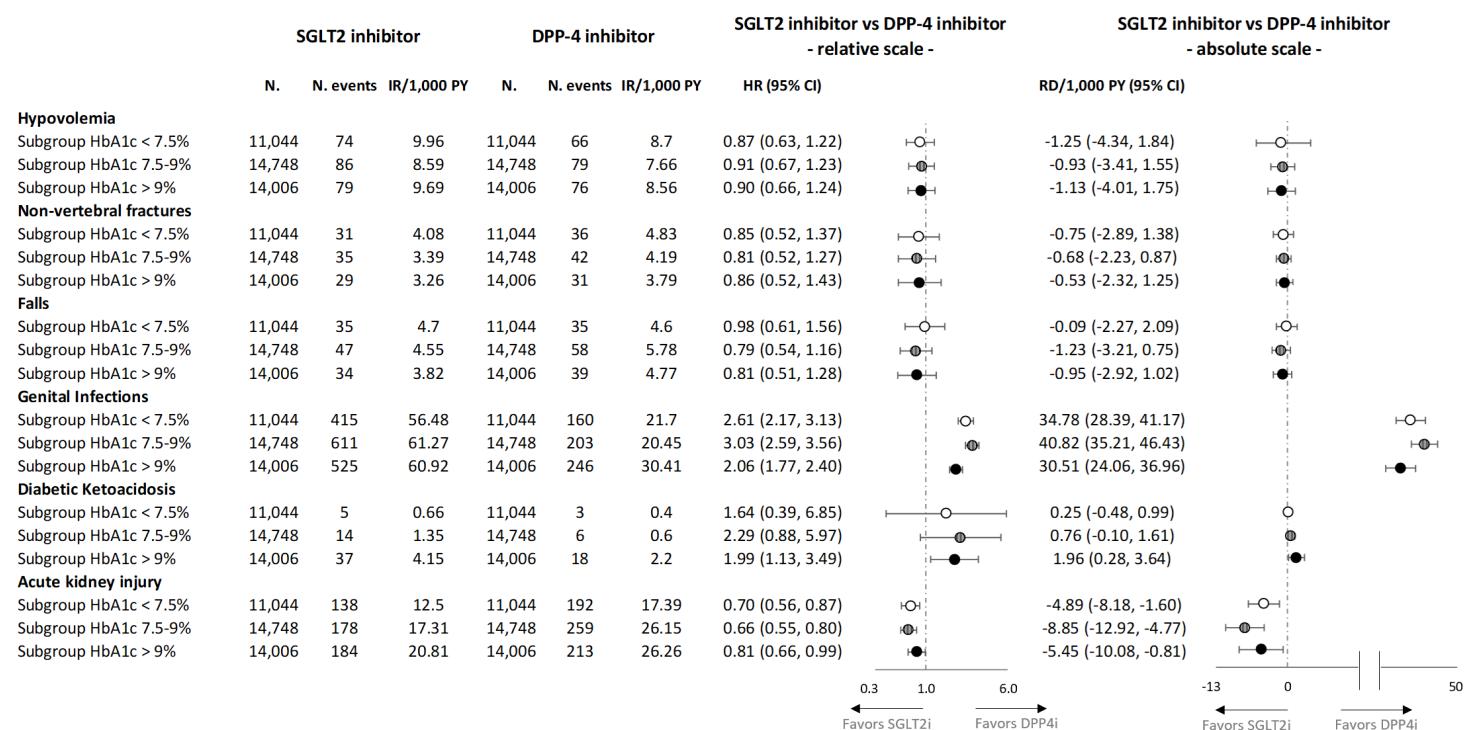

**eTable 8.** Time-limited “intent-to-treat” analysis and secondary analyses of the primary effectiveness outcomes in 1:1 propensity score-matched patients initiating SGLT2 inhibitor vs. DPP-4 inhibitor therapy and stratified by HbA<sub>1c</sub> levels.

| Sensitivity analyses for effectiveness outcomes  | Events, N (IR/1,000 PY) | Events, N (IR/1,000 PY) | HR (95% CI)       | RD/1,000 PY (95% CI)  |
|--|-------------------------|-------------------------|-------------------|-----------------------|
| <b>1. Time-limited “intent-to-treat” analysis</b>  |                         |                         |                   |                       |
| <b>Modified MACE*</b>  |                         |                         |                   |                       |

Abbreviations: DPP-4, dipeptidyl peptidase 4; SGLT2, Sodium-Glucose Cotransporter-2; N, number; IR, incidence rate; PY, person-years; RD, rate difference; HR, hazard ratio; CI, confidence interval; HF, heart failure; MACE, major adverse cardiac events (i.e., myocardial infarction, stroke, and all-cause mortality).

**eTable 9.** Number of events, incidence rates, relative and absolute estimates for sensitivity analysis of incident safety outcomes in 1:1 PS-matched initiators of SGLT2 inhibitors vs. DPP-4 inhibitors

Abbreviations:DPP-4, dipeptidyl peptidase 4; SGLT2, Sodium-Glucose Cotransporter-2; N, number; IR, incidence rate; PY, person-years; RD, rate difference; HR, hazard ratio; CI, confidence interval; HbA1c, glycated hemoglobin.

P value for homogeneity is > 0.05 for all outcomes except for genital infections where p value for homogeneity is < 0.01.
