Received 5 November 2008; accepted 24 November 2008

Key indicators: single-crystal X-ray study; $T = 273\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$;
 R factor = 0.030; wR factor = 0.072; data-to-parameter ratio = 17.7.

The title complex, $[\text{Zn}(\text{C}_2\text{H}_3\text{O}_3)_2(\text{H}_2\text{O})_2]$, was prepared and the crystal structure determined as part of a ^{67}Zn solid state nuclear magnetic resonance study. In the title complex, the Zn atom has a distorted octahedral coordination comprising two bidentate glycolate ligands and two water molecules. The water molecules are *cis* to each other; one is *trans* to a carboxylate O atom and the other *trans* to an alcohol O atom. The crystal structure has an extensive O—H···O hydrogen-bond network.

Related literature

The crystal structure of the title complex was first reported by Fischinger & Webb (1969). For bond-length data, see: Allen *et al.* (1987).

Redetermination of *cis*-diaquadiglycolatozinc(II)

P. Kennedy, N. Francis, D. Rovnyak and M. E. Kastner

Comment

As part of a Zinc-67 solid state nuclear magnetic resonance study the title complex, (I), was prepared and the crystal structure determined. The structure of this complex was first report by Fischinger & Webb (1969) but no fractional crystal coordinates were reported.

The molecular structure of (I) is illustrated in Fig. 1. The zinc atom has a distorted octahedral coordination sphere composed of two bidentate glycolato ligands and two water molecules. The water molecules are *cis* to each other; one (O1) is *trans* to a carboxylate O-atom (O4), and the other, (O2), is *trans* to an alcohol O-atom (O6). The bond distances and angles are normal for zinc(II) complexes (Allen *et al.*, 1987).

In the crystal structure of (I) there in an extensive O—H···O hydrogen bonding network (Table 1). The two water molecules (O1 and O2) bond to the two oxygens (O4 and O5) of a carboxylate group related by the c-glide. The two alcohol groups (O3 and O6) form hydrogen bonds with the other carboxylate group (atoms O7 and O8) translated by one unit cell along the b axis. The carbonyl oxygen O8 of this ligand also makes a two dimensional hydrogen bonded network with one of the waters (O1) around the inversion center. The other water molecule, (O2), forms an H-bond with a carbonyl oxygen (O5) related by the 2-fold screw axis.

Experimental

Glycolic acid (100 mg, 3 mmol), purchased from Sigma-Aldrich (99%), was dissolved in 5 ml of deionized water. Basic zinc carbonate (80 mg, 2 mmol) was added and the mixture stirred for 10 minutes while heating to ca. 60°C. The resulting mixture was filtered, and the filtrate left to stand at room temperature until large needle-like crystals grew by slow evaporation of the water.

Refinement

The alcohol and water H-atoms were placed at the locations identified in a difference Fourier map and were held fixed, with $U_{\text{iso}}(\text{H})$ set to 0.05 Å²: O-H = 0.8293 - 0.9135 Å. The C-bound H-atoms were included in calculated positions and treated as riding atoms: C-H = 0.97 Å with $U_{\text{iso}}(\text{H})$ = 1.2 U_{eq} (parent C-atom).

Secondary atom site location: difference Fourier map	Extinction coefficient: 0.0094 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and

goodness of fit S are based on F^2 , conventional R -factors R are based

on F , with F set to zero for negative F^2 . The threshold expression of

$F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is

not relevant to the choice of reflections for refinement. R -factors based

on F^2 are statistically about twice as large as those based on F , and R -

factors based on ALL data will be even larger.
